EDITED FOR THE ASSOCIATION UNDER THE DIRECTION OF THE BOARD OF TRUSTEES BY

MORRIS FISHBEIN, M.D.

VOLUME 137 JULY ~~MAY~~—AUGUST 1948

AMERICAN MEDICAL ASSOCIATION, CHICAGO 10, 1948

OFFICERS OF THE AMERICAN MEDICAL ASSOCIATION—1948-1949

HEADQUARTERS OF THE ASSOCIATION, 535 N. DEARBORN ST., CHICAGO

GENERAL OFFICERS

President—R. L. Sensenich - - - - - - - - - - South Bend, Ind.
President-Elect—Ernest E. Irons - - - - - - - - - Chicago
Vice President—Roy W. Fouts - - - - - - - - - - - Chicago
Secretary and General Manager—George F. Lull - - - - - - - Chicago
Treasurer—J. J. Moore - - - - - - - - - - - - Chicago
Speaker, House of Delegates—Francis F. Borzell - - - - - - Philadelphia
Vice Speaker, House of Delegates—James R. Reuling - - - - Bayside, N. Y.
Editor—Morris Fishbein - - - - - - - - - - - - Chicago
Business Manager—Thomas R. Gardiner - - - - - - - - - - Chicago

BOARD OF TRUSTEES

Louis H. Bauer	Hempstead, N. Y., 1949
E. L. Henderson, Chairman,	Louisville, Ky., 1949
John H. Fitzgibbon	Portland, Ore., 1950
James R Miller	Hartford, Conn., 1950
Walter B. Martin	Norfolk, Va., 1951
Dwight H. Murray	Napa, Calif., 1952
Edward J. McCormick	Toledo, Ohio, 1952
Edwin S. Hamilton	Kankakee, Ill., 1953
Gunnar Gundersen	La Crosse, Wis., 1953

JUDICIAL COUNCIL

Edward R. Cunniffe, Chairman,	New York, 1949
Louis A. Buie	Rochester, Minn., 1950
Walter F. Donaldson	Pittsburgh, 1951
H. L. Pearson Jr.	Miami, 1952
John H. O'Shea	Spokane, Wash., 1953
George F. Lull, Secretary, ex officio	Chicago

COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

Reginald Fitz	Boston, 1949
Russell L. Haden	Cleveland, 1950
William S. Middleton	Madison, Wis., 1951
H. G. Weiskotten, Chairman	Syracuse, N. Y., 1952
Victor Johnson	Rochester, Minn., 1953
W. L. Pressly	Due West, S. C., 1954
Harvey *B.* Stone	Baltimore, 1955
Donald G. Anderson, Secretary	Chicago

COUNCIL ON SCIENTIFIC ASSEMBLY

Charles H. Phifer	Chicago, 1949
Henry R. Viets, Chairman	Boston, 1950
L. W. Larson	Bismarck, N. D., 1951
Stanley P Reimann	Philadelphia 1952
Alphonse McMahon	St. Louis, 1953

AND EX OFFICIO

The President-Elect, the Editor and the Secretary of the Association

COUNCIL ON MEDICAL SERVICE

Elmer Hess	Erie, Pa., 1949
Thomas A. McGoldrick	Brooklyn, 1949
James R. McVay, Chairman	Kansas City, Mo., 1950
J. D. Hamer	Phoenix, Ariz., 1950
H. B. Mulholland	Charlottesville, Va., 1951
Joseph D. McCarthy	Omaha, 1951
Edward L. Bortz	Philadelphia
R. L. Sensenich	South Bend, Ind.
Walter B. Martin	Norfolk, Va.
George F. Lull	Chicago
Thomas A. Hendricks, Secretary	Chicago

COUNCIL ON PHARMACY AND CHEMISTRY

(Standing Committee of Board of Trustees)

James P. Leake	Washington, D. C., 1949
David P. Barr	New York, 1949
W. Barry Wood Jr.	St. Louis, 1949
Morris Fishbein	Chicago, 1950
G. W. McCoy	New Orleans, 1950
Perrin H. Long	Baltimore, 1950
Elmer M. Nelson	Washington, D. C., 1950
Torald Sollmann, Chairman	Cleveland, 1951
Isaac Starr	Philadelphia, 1951
Robert F. Loeb	New York, 1951
E. M. K. Geiling	Chicago, 1952
Paul R. Cannon	Chicago, 1952
S. W. Clausen	Rochester, N. Y., 1952
E. D. Churchill	Boston, 1953
Joseph Stokes Jr.	Philadelphia, 1953
C. Guy Lane	Boston, 1953
R. T. Stormont	Washington, D. C., 1953
Austin E. Smith, Secretary	Chicago

COUNCIL ON PHYSICAL MEDICINE

(Standing Committee of Board of Trustees)

H. B. Williams	New York, 1949
Frank H. Krusen	Rochester, Minn., 1949
Anthony C. Cipollaro	New York, 1950
M. A. Bowie	Bryn Mawr, Pa., 1950
George M. Piersol	Philadelphia, 1950
W. E. Garrey	Nashville, Tenn., 1951
W. W. Coblentz	Washington, D. C., 1951
John S. Coulter, Chairman	Chicago, 1951
Derrick Vail	Chicago, 1951
W. E. Grove	Milwaukee, 1951
A. C. Ivy	Chicago, 1952
Frank R. Ober	Boston, 1952
Frank D. Dickson	Kansas City, Mo., 1952
Morris Fishbein, ex officio	Chicago
Howard A. Carter, Secretary	Chicago

COUNCIL ON FOODS AND NUTRITION

(Standing Committee of Board of Trustees)

C. L. Ladd	Washington, D. C., 1949
John B. Youmans	Chicago, 1949
H. C. Stuart	Boston, 1950
Morris Fishbein	Chicago, 1950
R. M. Wilder	Rochester, Minn., 1951
Howard B. Lewis	Ann Arbor, Mich., 1951
J. S. McLester, Chairman	Birmingham, Ala., 1951
Philip C. Jeans	Iowa City, 1952
C. A. Elvehjem	Madison, Wis., 1952
William J. Darby	Nashville, Tenn., 1953
George R. Cowgill	New Haven, Conn., 1953
James R. Wilson, Secretary	Chicago

COUNCIL ON INDUSTRIAL HEALTH

(Standing Committee of Board of Trustees)

R. T. Johnstone	Los Angeles, 1949
A. J. Lanza	New York, 1949
C. D. Selby	Detroit, 1949
Warren F. Draper	Washington, D. C., 1950
Raymond Hussey	Detroit, 1950
Henry H. Kessler	Newark, N. J., 1950
L. D. Bristol	Harrisburg Pa., 1951
Paul B. Magnuson	Washington, D. C., 1951
Robert A. Kehoe	Cincinnati, 1951
H. A. Vonachen	Peoria, Ill., 1952
W. A. Sawyer	Rochester, N. Y., 1952
James S. Simmons	Boston, 1952
E. J. McCormick, ex officio	Chicago
C. M. Peterson, Secretary	Chicago

COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE

(Standing Committee of Board of Trustees)

James C. Sargent, Chairman	Milwaukee
Richard L. Meiling	Columbus, Ohio
W. McK. Craig	Rochester, Minn.
Harold S. Diehl	Minneapolis
Perrin H. Long	Baltimore
Harold C. Lueth	Omaha
Stafford Warren	Los Angeles

AND EX OFFICIO

Edward L. Bortz	Philadelphia
George F. Lull	Chicago

COMMITTEE ON SCIENTIFIC EXHIBIT

Dwight H. Murray, Chairman	Napa, Calif.
James R. Miller	Hartford, Conn.
E. J. McCormick	Toledo, Ohio
Thomas G. Hull, Director	Chicago

ADVISORY COMMITTEE

Howard F. Root	Boston
Paul J. Hanzlik	San Francisco
Ludvig Hektoen	Chicago
Urban Maes	New Orleans
Max M. Peet	Ann Arbor, Mich.
James P. Leake	Washington, D. C

SECTION OFFICERS 1948-1949

Internal Medicine—Chairman, M. A. Blankenhorn, Cincinnati; Vice Chairman, Priscilla White, Boston; Secretary, *Walter L Palmer, 950 E. 59th Street, Chicago.*

Surgery, General and Abdominal—Chairman, William D. McFee, Boston; Vice Chairman, Emile Holman, San Francisco; Secretary, Michael E. DeBakey, 1430 Tulane Avenue, New Orleans 13.

Obstetrics and Gynecology—Chairman, *Leroy A. Calkins, Kansas City; Vice Chair-*
[illegible]o; Secretary, Arthur B. Hunt, 102 Second Avenue

Hayward Post, St. Louis, Vice Chairman, Brittain
Trygve Gundersen, 101 Bay State Road, Boston.

Laryngology, Otology and Rhinology—Chairman, Henry B. Orton, Newark, N. J.; Vice Chairman, Daniel S. Cunning, New York, Secretary, J. Milton Robb, 1553 Woodward Avenue, Detroit.

Pediatrics—Chairman, Woodruff L. Crawford, *Rockford, Ill.; Vice Chairman,* W. Ambrose McGee, Richmond, Va., Secretary, Margaret Mary Nicholson, 1801 I Street N.W., Washington, D. C.

Experimental Medicine and Therapeutics—Chairman, Dwight L. Wilbur, San Francisco; Vice Chairman, McKeen Cattell, New York, Secretary, Carl V. Moore, 600 South Kingshighway, St. Louis.

Pathology and Physiology—Chairman, George E. Wakerlin, Chicago; Vice Chairman, Frank W. Konzelmann, Atlantic City; Secretary, Edwin F. Hirsch, 1439 South Michigan Avenue, Chicago.

Nervous and Mental Diseases—Chairman, Francis J. Gerty, Chicago; Vice Chairman, Luman Daniels, Denver; Secretary, Frederick P Moersch, 102 Second Avenue S.W., Rochester, Minn

Dermatology and Syphilology—Chairman, Anthony C. Cipollaro, New York; Vice Chairman, Michael H. Ebert, Chicago, Secretary, Clinton W. Lane, 3720 Washington Blvd., St. Louis.

Preventive and Industrial Medicine and Public Health—Chairman, Oscar A. Sander, Milwaukee; Vice Chairman, C. N. Neupert, Madison, Wis.; Secretary, Rutherford T. Johnstone, 727 W. Seventh Street, Los Angeles.

Urology—Chairman, Hamilton W. McKay, Charlotte, N. C.; Vice Chairman, Norris J. Heckel, Chicago; Secretary, Edward N. Cook, 102 Second Avenue S.W., Rochester, Minn.

Orthopedic Surgery—Chairman, David M. Bosworth, New York; Vice Chairman, Walter P. Blount, Milwaukee; Secretary, Joseph S. Barr, 231 Marlborough Street, Boston.

Gastro-Enterology and Proctology—Chairman, William H. Daniel, Los Angeles; Vice Chairman, Russell S. Boles, Philadelphia; Secretary, Grant H. Laing, 104 South Michigan Avenue, Chicago.

Radiology—Chairman, Harry M. Weber, Rochester, Minn.; Vice Chairman, U. V Portmann, Cleveland; Secretary, Paul C. Hodges, 950 East 59th Street, Chicago

Anesthesiology—Chairman, C. Walter Metz, Denver; Vice Chairman, Urban Eversole, Boston; Secretary, John S. Lundy, 102 Second Avenue S.W., Rochester, Minn

General Practice—Chairman, Winfred B. Harm, Detroit; Vice Chairman, Milton B Casebolt, Kansas City, Mo.; Secretary, Thomas E. Robinson, 1088 East 21st South Street, Salt Lake City.

Diseases of the Chest—Chairman, Shelley U. Marietta, Washington, D. C.; Vice Chairman, Harry C. Warren, San Francisco, Secretary, Jay A. Myers, 91 South 7th Street, Minneapolis

FOLIC ACID THERAPY

Its Effect as Observed in Two Patients with Pernicious Anemia and Neurologic Symptoms

SAMUEL D. JACOBSON, M.D.
LAWRENCE BERMAN, M.D.
ARNOLD R. AXELROD, M.D.
and
ELMORE C. VONDER HEIDE, M.D.
Detroit

The antianemic properties of folic acid have been demonstrated repeatedly,[1] and this work has been summarized by Berry and Spies.[2] It has also been emphasized that folic acid is effective in those patients with macrocytic anemia who also exhibit megaloblastic erythropoiesis in the bone marrow.[3] It is still not known, however, whether folic acid therapy is able to produce and maintain in patients with addisonian pernicious anemia complete hematologic and clinical remission, nor are the optimum dosage of folic acid and the preferable method of administration definitely established.

In the course of an investigation of the therapeutic role of folic acid, the details of which will be reported at a later date, 2 patients with addisonian pernicious anemia were encountered whose clinical course while they were receiving folic acid was characterized by a symptomatic relapse. The histories of these patients are reported now because of their clinical interest.

REPORT OF CASES

CASE 1.—H. W., a 78 year old white woman, was well until eight months before admission, at which time she began to notice gradually increasing malaise, anorexia, generalized weakness and exertional dyspnea. She also noticed numbness and tingling of the toes and the fingers. These symptoms continued until ten weeks before admission, when she had an infection of the upper respiratory tract, for which her physician prescribed symptomatic therapy. Following the acute infection, the symptoms of malaise and weakness became so severe that she was confined to bed. The numbness and tingling of the fingers and the toes increased. Four weeks before being admitted to the hospital she lost all desire for food. The rest of the past history was not contributory.

Examination revealed an obese, elderly, white female who appeared apathetic. The skin was pale, and the scleras were icteric. The ocular fundi exhibited moderate arteriosclerosis. The mucous membranes of the mouth were pale. The edges of the tongue were smooth. The lungs were clear. The heart was slightly enlarged to the left. A blowing systolic murmur was heard over the entire precordium. The blood pressure was 90 systolic and 50 diastolic. The liver, the kidneys and the spleen could not be palpated. Knee and ankle reflexes were absent bilaterally. Vibratory sensation was absent over both lower extremities to the level of the iliac crests. Sense of motion and sense of position were intact.

Roentgenologic examination of the chest and of the upper gastrointestinal tract revealed nothing significant.

The serologic tests were negative. The urine was normal. Chemical analysis revealed the blood urea to be 68 mg. per hundred cubic centimeters. No free hydrochloric acid was demonstrated in the gastric juice after histamine stimulation.

The initial examination of the peripheral blood revealed 3.3 Gm. of hemoglobin per hundred cubic centimeters. The red cell count was 980,000 per cubic millimeter. The red cells showed anisocytosis, poikilocytosis and polychromasia. The white cell count was 6,200, with a differential count of 16 per cent polymorphonuclear cells, 33 per cent band forms, 38 per cent lymphocytes, 10 per cent monocytes, 3 per cent eosinophils and 1.8 per cent reticulocytes. The platelets numbered 33,000. The mean cell diameter was 7.7 microns. The mean corpuscular volume was 138 cubic microns; the mean corpuscular hemoglobin was 34 micrograms; the mean corpuscular hemoglobin concentration was 25 per cent. Examination of material obtained by sternal aspiration revealed hyperplastic megaloblastic marrow.

A diagnosis of addisonian pernicious anemia in relapse was made.

The patient was given a hospital ward diet containing approximately 300 Gm. of carbohydrate, 65 Gm. of protein and 70 Gm. of fat. In addition she was given 25 mg. of synthetic folic acid by intramuscular injection daily for eleven consecutive days. A total of 275 mg. was thus given. The hematologic response is summarized in chart 1. An increase in reticulocyte count was noted on the fifth day of therapy. A maximum reticulocyte response of 57.5 per cent was observed on the ninth day. The hemoglobin concentration and the red blood cell count also began to increase.

The dose was then changed to 65 mg., taken orally daily, and this dosage was continued for the next thirty days. The patient's appetite and clinical appearance improved. By the fifteenth day of therapy she was mentally alert and cheerful. As is indicated, the hemoglobin concentration and the red blood cell count continued to improve. The numbness and tingling of the fingers and the toes disappeared. The aspiration of sternal marrow was repeated on the fifteenth day, and examination revealed marked hyperplasia, with the previously megaloblastic erythropoiesis reverting to normoblastic erythropoiesis.

The dose of folic acid was changed to 195 mg., taken orally twice weekly for three and one-half weeks. When the patient

---

The synthetic folic acid was supplied by the Lederle Laboratories, Inc., New York.

was discharged from the hospital, her hemoglobin was 10.9 Gm.; the red cell count was 3,950,000; the white cell count was 6,500; the platelet count was 120,000, and the mean cell diameter was 7.3 microns.

The patient was discharged to the outpatient clinic on a daily oral dose of 10 mg. of synthetic folic acid. At weekly intervals she reported for clinical evaluation. She remained symptomatically well, and her red cell count averaged about 4,000,000 for approximately two months after her discharge. At this time she began to complain again of numbness and tingling of the fingers and the toes. Her appetite and sense of well-being at this time were good. The dose of folic acid was *increased to 25 mg., taken orally for one week. The numbness* and tingling became worse. The daily oral dose was then increased to 50 mg. for another week. Despite the increased dose, her neurologic complaints were again more disturbing, and she again became irritable and mentally confused, although the objective neurologic findings remained essentially unchanged. The hemoglobin at this time was 9.75 Gm., and the red cell count was 3,820,000. It was thought advisable to change the therapy by substituting liver extract of known potency, and she received 20 units intramuscularly three times weekly.

Case 2.—H. P., a white man aged 62, was admitted to the hospital after complaining of progressive weakness for one year. In addition he had experienced exertional dyspnea, numbness and tingling of his toes, and anorexia. The weakness and the exertional dyspnea had become so severe that he was confined to bed several weeks before admission. He said that there had not been nausea or vomiting. A review by systems showed nothing contributory.

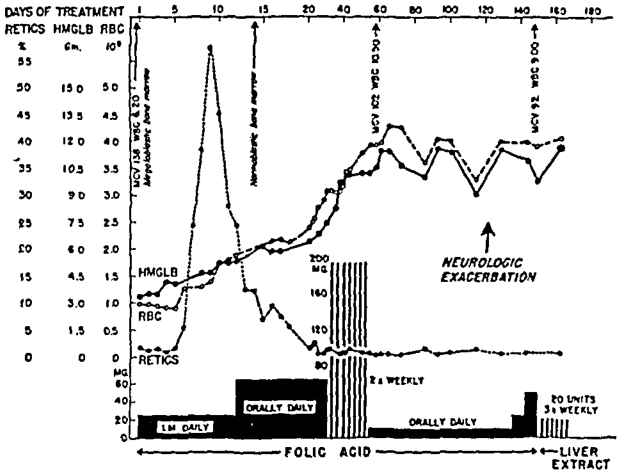

Chart 1 (case 1).—Hematologic curves observed in relation to the course of treatment of H. W., a 78 year old white woman suffering from pernicious anemia. *Retics* stands for reticulocytes; *HMGLB*, for hemoglobin, *RBC*, for red blood cells; *WBC*, for white cells; *IM*, for intramuscular injection; *MCV*, for mean corpuscular volume.

On examination the patient appeared drowsy, somewhat confused and irrational. The skin was icteric, as were the scleras. The mucous membranes were pale. The tongue was smooth and pale. A firm, tender liver edge was palpated 3 fingerbreadths below the right costal margin. The spleen was not palpable. Weakness of the extremities was noted. There was a loss of vibratory sense in the lower extremities. The sense of motion and that of position were intact. There was a positive Babinski response. The reflexes were generally hyperactive.

The initial examination of peripheral blood (after a transfusion of 200 cc. of whole blood) revealed a red cell count of 730,000 cells per cubic millimeter; the hemoglobin content was 2.7 Gm. per hundred cubic centimeters of blood; the reticulocyte count was 1.7 per cent; the white cell count was 5,800; the differential count was myelocytes 1 per cent, metamyelocytes 1 per cent, band forms 36 per cent, polymorphonuclear cells 44 per cent, lymphocytes 19 per cent and occasional monocytes. The platelets numbered 16,000. The mean cell diameter was 7.95 microns; the mean corpuscular volume was 122 cubic microns; the mean corpuscular hemoglobin was 34 micrograms; the mean corpuscular hemoglobin concentration was 31 per cent. The initial examination of marrow revealed megaloblastic erythropoiesis.

Chemical examination of the blood showed the urea to be 68 mg. per hundred cubic centimeters. The serum albumin was 2.7 Gm. and the serum globulin 4.0 Gm. per hundred cubic centimeters. Serologic tests were negative. The urine was normal. Gastric analysis showed achlorhydria after injection of histamine. The stool showed no occult blood. Roentgenograms of the upper gastrointestinal tract revealed no abnormality.

A diagnosis of addisonian pernicious anemia in relapse was made.

Because of his critical condition the patient was given a transfusion of 200 cc. of whole blood. Two days after admission he had a chill followed by fever. Signs of bronchopneumonia were elicited clinically and confirmed by roentgenogram of the chest. He was given penicillin by intramuscular injection, and after nine days his pulmonary signs cleared and he became afebrile.

Two days after his admission a course of daily intramuscular injections of synthetic folic acid was started. After four days the dose was decreased to 20 mg. The dosage was revised after nine days, 20 mg. being injected intramuscularly three times a week, and this dosage was maintained until the patient was discharged from the hospital, at which time his dose was changed to 10 mg., taken by mouth daily. An increase of the reticulocyte count was noted on the fourth day of folic acid therapy. A maximum reticulocyte response of 45.1 per cent was observed on the seventh day. Within two weeks after therapy was instituted the patient was mentally alert, rational and able to be up and around the ward. At this time neurologic *examination revealed that vibratory sense was not present in the* knees and the left ankle but present, although diminished, in the right ankle.

The sense of motion and that of position were intact. The reflexes were not as active as initially. At the time of his discharge the red cell count was 3,540,000; the hemoglobin content was 8.26 Gm.; the white cell count was 4,100. The mean corpuscular volume was 88 cubic microns, and the mean cell diameter was 7.5 microns.

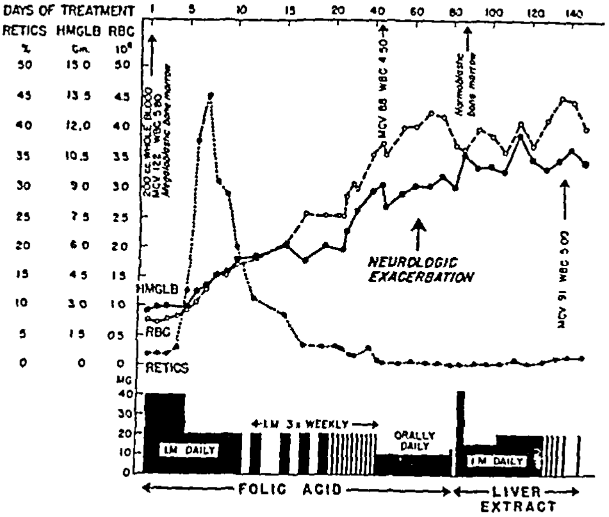

Chart 2 (case 2).—Hematologic curves observed in relation to the course of treatment of H. P., a white man aged 62, suffering from pernicious anemia. (See chart 1 for an explanation of the abbreviations.)

The patient was discharged to the outpatient clinic, taking 10 mg. of folic acid daily by mouth. He remained symptomatically well, and his red cell count remained close to 4,000,000 per cubic millimeter for approximately two weeks. At this time he again noted increasing difficulty in walking, progressing to a point where he required considerable support. He became unable to button his clothes, and there was a recurrence of numbness and tingling of the fingers and the toes. These symptoms became so severe that he required hospitalization five weeks after having been discharged.

On readmission the patient was found to be well oriented. There were fine rales at the base of the right lung. The patellar reflexes were hyperactive. The ankle reflexes were absent. The reflexes of the upper extremities were slightly hyperactive. Vibratory sensation was absent in the lower extremities. There was ataxia of both arms and legs. Despite the exacerbation of neurologic findings, the peripheral blood showed no hematologic relapse. The red cell count was 3,630,000; the hemoglobin content was 10.7 Gm.; the reticulocyte count was 0.2 per cent; the white cell count was 3,800. The mean corpuscular volume was 89 cubic microns, and the mean cell diameter was 7.3 microns. Examination of the marrow at this time revealed a hyperplastic marrow, with the previously megaloblastic erythropoiesis reverting to normoblastic erythropoiesis. However, the presence of pathologic neutrophils pointed to an incomplete hematologic remission.

Because of the severity of the neurologic signs and symptoms, liver therapy was started immediately. Fifteen U.S.P. units of potent liver extract was given by intramuscular injection daily for three weeks. The dosage was then changed to 20 units three times per week until discharge. Two weeks after this therapy was begun muscle coordination began to improve so that he was able to walk, although with difficulty. He also noticed greater agility of his fingers, and he was again able to button his clothes. The numbness and tingling began to decrease. His appetite increased impressively, and he gained 11 pounds (5 Kg.) in weight. At the time of his second discharge neurologic examination revealed that the patellar reflex and the reflexes of the upper extremities were slightly hyperactive. The ankle reflexes were diminished. There was no Babinski response. Vibratory sense was present but diminished at both wrists. Motion sense and position sense were present but uncertain. At discharge his red cell count was 4,400,000; the hemoglobin content was 10.4 Gm.; the white cell count was 5,000, and the platelets numbered 230,000. The mean corpuscular volume was 91 cubic microns, and the mean cell diameter was 7.3 microns.

COMMENT

In both cases an initial satisfactory hematologic response to folic acid occurred in that both patients exhibited maximum reticulocytosis as compared with the standards for maximum reticulocyte response to adequate liver therapy. In addition the hemoglobin concentration and the red cell count rose progressively in both patients, and the bone marrow reverted to a normal pattern. However, after four months of therapy in case 1 and after two months of therapy in case 2 the peripheral blood values had still not reached their optimal levels in spite of the fact that the doses used were well above those required to produce the maximal reticulocytosis.[4]

In both cases there was an initial clinical improvement, manifested by increase of appetite, general strength and mental alertness, and the numbness and tingling of the fingers and the toes disappeared. However, after four months of therapy in case 1, and while the hematologic picture was still improving in case 2, there was a reappearance of numbness and tingling and mental confusion, and in case 2, a marked increase of difficulty in locomotion.

Several possibilities must be considered to explain the exacerbation of the neurologic symptoms. The factor of nutritional deficiency, particularly deficiency of the vitamin B complex, does not appear to be important here, because both patients had good appetites while the clinical relapses were developing, and as far as can be determined by questioning, both ate an adequate amount of foods containing the components of the vitamin B complex. This factor is further minimized by the observation that there is a lack of demonstrable therapeutic response on the part of all of the neurologic symptoms of pernicious anemia after the administration of the common components of the vitamin B complex.[5]

There is a question also as to whether these patients were treated with adequate doses of folic acid. In our experience a reticulocyte crisis and an increase of the number of red cells and of the hemoglobin concentration can be produced by a daily oral dose of 5 mg. in cases of pernicious anemia.[3] Doan, Wilson and Wright[1c] accomplished the same results with 1 mg. daily. In our cases the doses administered were in excess of those required to initiate a clinical and hematologic remission. Even if we assume that an adequate dose of folic acid can produce a complete hematologic remission in pernicious anemia, and this point is by no means certain, it does not follow that the same dose will ward off neurologic relapse. Certainly, in the 2 cases reported, 10 mg. daily was not able to prevent such a relapse. It may be that, as with liver extract, folic acid must be administered in amounts in excess of that which is necessary to produce hematologic remission to insure neurologic remission as well.

Unfortunately, the clinical deterioration of our patients was such as to preclude further trial of folic acid. It will be important to see whether large doses of folic acid given each for many months will be more effective in preventing neurologic relapse.

SUMMARY

Two cases in which addisonian pernicious anemia was treated with synthetic folic acid are presented.

Although an initial satisfactory clinical response was obtained during treatment, neurologic exacerbations developed.

Daily doses of 10 to 50 mg. of synthetic folic acid were not adequate for maintaining hematologic improvement after the patients' blood had reached a level of over 4,000,000 red cells per cubic millimeter, nor was this dose adequate for the prevention of neurologic exacerbations.

It is suggested that a daily dose of 50 mg. or more of synthetic folic acid be given a thorough clinical trial for both treatment and maintenance of patients with pernicious anemia in order that the question whether folic acid is useful in the prevention of neurologic exacerbations may be answered.

Blunder in Pelvic Mensuration.—Although the principles of clinical measurement of the pelvis were established by William Smellie in 1754, the subsequent introduction by other practitioners of certain fallacious assumptions postponed any correct acquaintance with that discipline for a hundred years and, even after that, many of the more deeply rooted errors continued to persist. The evidence seems clear, indeed, that there is no phase of obstetrics which has been so fraught with blunder, oversight and floundering as has pelvic mensuration; and in view of the present status of the subject—diverse notions as to what constitutes disproportion, conflicting opinions about the value of x-ray mensuration, and so forth—it would appear that this old legacy of error is still with us.—Eastman, Nicholson J., *Obstetrical and Gynecological Survey,* June 1948.

RADICAL ORCHIECTOMY FOR TUMORS OF THE TESTIS

LLOYD G. LEWIS, M. D.
Washington, D. C.

The varied cellular structure of testicular tumors suggests that no single method of treatment is universally applicable. Simple orchiectomy can cure in but a small percentage of cases because of the frequency of early metastasis. The combined therapy of simple orchiectomy and radiation therapy, which is employed by the members of the profession throughout the country, using the standard 250,000 volt roentgen equipment, has proved adequate only for seminoma. Radical orchiectomy, as described by Chevassu,[1] was abandoned by Young, and limited to teratomas by Hinman[2] because of the relative frequency with which inoperable metastasis was found in their patients. I shall try to show that a clinical-pathologic classification of testicular tumors indicates that surgical treatment should be extended and radiation therapy rationalized.

DIAGNOSIS

The cure of testis tumors depends on control of the retroperitoneal metastatic areas, and the operability depends primarily on early diagnosis. The differential diagnosis of a testicular tumor by means of bimanual palpation, a measure which my associates and I must insist on, is not difficult. Varicocele, hydrocele of the cord, spermatocele and epididymitis can be ruled out readily. Thus, the only difficulty encountered is in differentiating a tumor from thickened walled or calcified hydrocele, gumma and hematocele, About 25 per cent of our patients had been treated for epididymitis or traumatic orchitis. Tapping of the hydrocele is permissible to facilitate palpation. When the diagnosis is in doubt, exploration of the scrotum is indicated. Biopsy of the testis is in our opinion contraindicated. Roentgen examination of the scrotum sometimes affords differentiation of peripheral calcification from the central or scattered calcification of tumor growth.

As soon as the diagnosis of testicular tumor is made, simple orchiectomy should be done without delay. In our opinion inguinal orchiectomy has no advantage over scrotal orchiectomy. Further definitive therapy then depends on the pathologic diagnosis.

Hormone bio-assays are in our opinion only confirmatory evidence of tumor. Since both the chorionic gonadotropins and the follicle-stimulating hormones are reported together, the test has little value. If differentiation is to be made, complicated laboratory tests must be carried out on hypophysectomized animals, and such investigation is not now practicable. Thirty-five per cent of our patients with seminoma had positive reactions to Friedman tests. This incidence is identical to that in the control series for the presence of combined hormones. All the reactions were strongly positive in patients with chorionic tumors. Nevertheless, hormone bio-assays should be done to confirm the pathologic picture.

ROENTGEN THERAPY

Prophylactic as well as definitive roentgen therapy consists of delivering the full lethal tumor dose to the frequently involved metastatic areas. Dr. Milton Friedman[3] of New York carried out tests to determine the radiosensitivity of intact testicular tumors at Walter Reed General Hospital. Although such studies on inoperable and late metastases would not be informative, this study was of value because the results showed that seminoma can be completely destroyed by roentgen rays in a dosage of 600 to 800 roentgens delivered in six to seven days. Thus one sees that the adequate prophylactic dose for the retroperitoneal area is about 1,000 roentgens in divided dosage. This dose can be delivered with the 250,000 volt machine and requires about six weeks of treatment, whereas the same dose, delivered with the 1,000,000 volt machine, requires two weeks. In carcinoma, undifferentiated, the lethal tumor dose is about 2,000 roentgens, while in some adenocarcinomas the dose is about 3,000 roentgens. Chorioepitheliomas and tumors of trophoblastic tissue require a dose of 5,000 to 6,000 roentgens. Since tumors composed of adult teratomatous structures cannot be affected by ''safe'' dosage, it is obvious that roentgen therapy with the standard 250,000 volt machine is inadequate for both the prophylactic and the definitive treatment of any tumors except seminomas.

The dosage by 250,000 volt therapy is limited by cutaneous reactions. The skin offers no protection from overdosage to the patient when the 1,000,000 volt machine is used. When required, we have used the 5,000 roentgen dose. The patients withstood the impact of this high dosage without serious damage to the skin but the incidence of late gastrointestinal complications confines the use of such high dosage to those cases with known inoperable metastases. Fourteen of our patients treated by dosage in excess of 5,000 roentgens had perforations of the stomach or bowl which occurred from one and one-half to two years following therapy. Six of these patients recovered after difficult and immediate surgical intervention but the remaining 8 died and at autopsy no viable tumor was found. In 3 additional patients paralysis of the lower extremities

recently developed as a result of such high dosage.

CLASSIFICATION OF TUMORS

A great deal of difficulty has arisen because no generally accepted pathologic classification of tumors of the testis exists. Tumors of the supporting tissues of the testis, sarcomas and hemangiomas, are rare and were not seen in our series of patients of military age. Two benign interstitial cell tumors found in well masculinized persons were treated. Tumors of germ cell origin —and I think that seminoma can be included in this group—comprise 99.5 per cent of our cases. Although Ewings'[4] theory of the development of these tumors from a totipotent cell deserves serious consideration, it does not indicate that all tumors should be treated alike. Embryonal carcinoma, according to the classification of the Army Institute of Pathology,[5] includes embryonal carcinomas undifferentiated, adenocarcinoma and papillary adenocarcinoma, choriocarcinoma, and chorioepithelioma in a subgroup. The radiosensitivity studies, as shown, indicated that chorionic tumors must be differentiated because of the wide variation in the response to roentgen rays. The term teratocarcinoma does not specify the particular type of maligant cell involved and, therefore, I suggest the following clinical-pathologic classification:

Tumors of Germ Cell Origin

	Number	Percentage
Seminoma	110	44.0
Undifferentiated or adenocarcinoma	28	11.2
Trophocarcinoma from cytotrophoblast	17	6.8
Chorioepithelioma from syncytotrophoblast	12	4.8
Teratoma with undifferentiated or adenocarcinoma	35	14.0
Teratoma with trophocarcinoma	28	11.2
Teratoma with chorioepithelioma	12	4.8
Teratoma	8	3.2
	250	100

Seminoma is a relatively slowly growing, rounded or lobulated tumor, occurring in any part of the testis and found in the older age group in particular. It is the common tumor of cryptorchids and those patients with atrophic testes. This tumor metastasizes rather late, by way of the lymph channels. It is highly radiosensitive and the prognosis is good. Although seminoma cells are found in association with trophocarcinoma and teratoid tumors, the seminoma may be regarded as a unicellular tumor in most instances. The cells are rather uniform with clear cytoplasm and darkly staining nuclei and grow in sheets or strands, occasionally suggesting an acinar pattern. The remaining testis tubules are compressed rather than invaded. There is a remarkable tendency to spontaneous necrosis, and since these necrotic areas are unaffected by roentgen rays, we were able to make a diagnosis in 6 cases in which the viable tumor was destroyed by radiation. The metastases from seminoma may involve solitary lymph nodes, but this tumor tends to lay down a sheet of metastatic tumor cells over the iliac vessels and the vena cava with the result that resection of the retroperitoneal metastases is frequently impossible. Radical orchiectomy is not definitely indicated in seminoma because of the high radiosensitivity of the tumor and the frequent inoperability of metastases.

Classification of those tumors of definite embryonic cells, undifferentiated or in acinar or papillary pattern without chorionic elements seems necessary. These tumors grow rapidly, metastasize early and invade testis tubules. Undifferentiated carcinoma requires a roentgen dose of 2,000 to 3,000 roentgens. The metastases usually involved one or more lymph nodes in the retroperitoneal area, a situation which makes for operability. We believe that all tumors in need of a roentgen dose of more than 1,000 roentgens, lethal tumor dose, should be treated by surgical resection of the retroperitoneal nodes whenever the preoperative roentgenographic studies have ruled out pulmonary or inoperable metastases.

The Army Institute of Pathology recognizes the frequency of occurrence of chorionic tissues in what they have termed "embryonal carcinoma." Definitely cytotrophoblastic cells, the precursor of the syncytotrophoblastic cells of choriophithelioma, are readily recognized. They appear in an acinar pattern and in a papillary form as in choriopapillary adenocarcinoma. These tumors grow rapidly and metastasize early. They are, along with chorioepitheliomas, the hemorrhagic tumors of the testes. Any rapidly growing tumor of the testis which suddenly decreases in size is suggestive of choriocarcinoma. These tumors invade blood vessels and metastasize by way of the blood stream as well as by way of the lymphatic system.

Chorioepithelioma is a well recognized tumor which is composed of Langhans cells and syncytium. This tumor is characterized by early metastasis, and many patients present themselves for treatment because of metastatic symptoms. In 4 of our patients there was no palpable testicular tumor, and serial sections were necessary to locate the microscopic primary lesion. This tumor also metastasiz by way of the blood stream and lymphatics. It is radioresistant and most frequently inoperable.

[5] Friedman, N.B.: Atlas of Genitourinary Pathology, Army Institute of Pathology, United States War Department, Surgeon General's Office, 1946.

Teratocarcinoma implies the presence of adult or embryonic structures derived from more than one primitive germ layer, in addition to the carcinomatous element. These tumors are the cystic tumors which may be easily recognized on gross examination. Lethal tumor cells in teratocarcinoma may take the form of seminoma, embryonal carcinoma, choriocarcinoma, chorioepithelioma, or the differentiated tissue itself may become malignant. In view of this variety of possibilities, the type of the malignant cell occurring with teratoid elements should be described in the diagnosis so that definitive treatment can be undertaken. At first we thought that the teratomas should be differentiated into immature and mature types, but since there is so little difference in the end results and since these immature and mature structures are so frequently mixed, there is no point in differentiating them.

In a few instances one finds tumors composed of various adult teratomatous structures without evidence of malignant change. These tumors are relatively slowly growing and are late to metastasize. Radical orchiectomy alone is indicated because of their high radioresistance and delayed but definite tendency to metastasize.

Although tumors of the interstitial cells of Leydig are usually benign, malignancy is noted in a small percentage of cases. The radiosensitivity of these tumors has not been studied. In both of our cases, radical orchiectomy was done because, on gross section, these reddish brown tumors, occupying the entire testis in each case, appeared to be malignant. Frozen section is of no value in differentiating this tumor, and therefore it is wise to wait for the report on permanent sections before radical resection of the retroperitoneal nodes is attempted.

RESECTION

Radical resection of the retroperitoneal nodes and spermatic cord is best done with the patient under spinal anesthesia, using an incision which extends from the tip of the eleventh rib to the external inguinal ring. It is not necessary to continue the incision to the costovertebral angle. When large nodes must be removed around the renal pedicles, extension of the incision medially, in the form of a figure 7, facilitates their removal. After incision of the skin and subcutaneous tissues, the external oblique fascia and muscle are split. The internal oblique and transversalis muscles are sharply divided in order to expose the retroperitoneal space. The internal spermatic vessels are exposed in their sheath between the transversalis fascia and the peritoneum, triply clamped, divided and doubly ligated at their origins on the aorta and the vena cava or renal pedicle. The dissection is carried downward to the point where the vas leaves the vessels. Downward dissection avoids accidental opening of the peritoneum, but if the dissection is carried upward from the scrotum, the peritoneum frequently is opened accidentally at the point where the vas turns to pass down over the posterior surface of the bladder. Occasionally lymph nodes are removed along the spermatic cord. The external inguinal nodes are never involved in a testicular tumor unless the scrotal wall has been invaded. The first involved node is situated at the internal inguinal ring on the anterior surface of the external iliac artery. The lymph vessels then pass along the surface of that vessel to a node lying medial to it, just below the bifurcation of the hypogastric artery. The lymphatics then cross the common iliac artery to an elongated node lying between the common iliac artery and genitofemoral nerve. On the right side the lymphatics pass to nodes on the anterior surface of the vena cava and to nodes which lie between the vena cava and the aorta. The most frequently involved node is located below the entrance of the internal spermatic vein into the vena cava. On the left side the nodes lie laterally to the aorta, and here the most frequently involved node is situated just below the point where the internal spermatic vein drains into the renal vein. Crossed retroperitoneal metastases may occur, but we observed them in selected cases only in instances of extensive metastatic involvement above the renal pedicle. These cases are inoperable. We sacrificed the left kidney in order to remove metastases around the renal pedicle in 2 patients with extremely radioresistant tumors.

One hundred and sixty-nine out of 250 patients were selected for radical retroperitoneal resection. There was no operative mortality and the morbidity was unexpectedly low. Complications occurred in 4 patients. In one patient atelectasis developed which was cleared by bronchoscopic suction, and in another pulmonary embolism developed following accidental opening and suture of the vena cava. We would not hesitate to ligate the vena cava if such an accident should occur again. The third patient had a superficial wound abscess, and in the fourth patient a large, sterile retroperitoneal abscess developed six months after radiation therapy.

Although we have done retroperitoneal resection on a number of patients with seminoma in order to establish the frequency, mode of metastatic involvement and operability of these tumors, we do not recommend this procedure for seminoma. This study enabled us to limit the fields for radiation therapy, thus permitting the delivery of adequate dosage with minimum radiation of the bowel. Radical resection seems indicated for all tumors which require more than 1,000 roentgens lethal tumor dose, and radical resection, as advised by

Hinman, should be carried out on all adult tumors.

COMBINED THERAPY

Prophylactic radiation therapy is definitely indicated in seminoma and undifferentiated carcinoma. The dose for seminoma is about 1,000 roentgens and for undifferentiated carcinoma and adenocarcinoma about 3,000 roentgens. Prophylactic irradiation is contraindicated for those tumors requiring between 5,000 and 6,000 roentgens because of the late, serious complications which follow this large dosage. We would, therefore, reserve radiation therapy of large dosage for those patients who are known to have inoperable metastatic involvement.

It would be unfair to compare our results from radical surgical treatment in the 169 selected cases with those in the remaining series, *many of which were inoperable. The* results of combined therapy are presented in the accompanying table. Sixty-six per cent of our patients had no retroperitoneal metastatic involvement. In 24 per cent metastatic nodes were removed and in the remaining 10 per cent the metastic nodes were inoperable.

Results of Combined Therapy

	Number	Demonstrated Metas. %	Living 1½ to 5 Yr. %	Died %	Not Followed %
Interstitial cell tumors	2	0	100	0	0
Seminoma	109	23	74	10	16
Undifferentiated and adenocarcinoma	28	60	36	50	14
Trophocarcinoma, Carcinoma Cytotrophoblast	17	70	30	65	5
Chorioepithelioma from syncytotrophoblast	12	92	0	100	0
Teratoma with undifferentiated adenocarcinoma	34	38	67	24	9
Teratoma with trophocarcinoma	28	75	36	53	11
Teratoma with chorioepithelioma	12	7!	8.3	82.6	0
Teratoma	8	0	100	0	0
	250	43	55	32	13

CONCLUSIONS

1. Simple orchiectomy, either through a scrotal incision or an inguinal incision, with ligation of the cord at the internal inguinal ring, is not sufficient treatment for the cure of testis tumors.

2. Orchiectomy followed by 250,000 volt roentgen therapy is inadequate treatment for any tumor except seminoma.

3. Early diagnosis by means of bimanual palpation or scrotal exploration will increase the rate of cure.

4. Accurate clinical-pathologic diagnosis, after simple orchiectomy, will make possible the proper selection of definitive treatment, irradiation, extended surgical treatment or combined therapy.

5. Simple orchiectomy alone is required for benign tumors.

6. Radical orchiectomy is indicated in apparently benign teratomas because of their high radioresistance and the incidence of late metastases.

7. Simple orchiectomy followed by prophylactic or definitive radiation therapy appears to be sufficient for seminoma. The fact that only 5 of the 25 patients with known metastases have died of the tumor demonstrates the efficacy of roentgen therapy in this particular tumor.

8. Radical resection of the retroperitoneal nodes is definitely indicated for all malignant testicular tumors which require more than 1,000 roentgens lethal tumor dose; i.e., for all malignant tumors except seminomas.

ABSTRACT OF DISCUSSION

DR. HAROLD P. McDONALD, Atlanta, Ga.: The unusual opportunity afforded Dr. Lewis of seeing and treating so large a number of tumors of the testicle at the Walter Reed Hospital during the recent war should be of great value to urology. His experience has caused him to reclassify tumors of the testis on the basis of sensitivity of the tumor to roentgen radiation. This would put seminomas in one group and embryonal carcinomas, choriocarcinomas, chorioepitheliomas and some teratomas in another group. This latter group is made up of cells resistant to roentgen radiation and is hopeless unless radical resection of all metastatic retroperitoneal lymph nodes can be done. The seminoma group, responding to roentgen therapy, is treated by radiation and simple orchiectomy For roentgen therapy to be effective the inguinal, abdominal and lower thoracic regions must each receive adequate dosage of roentgen rays. This must be given during the first series of treatments, as it has been shown that when later nodes appear the roentgen therapy is not as effective as formerly. Since the seminoma group comprises almost half the testicular tumors this is of great importance. We have not subjected any patients to the radical resection of lymph nodes Our patients with embryonal carcinoma or choriocarcinoma or epithelioma have all died within two to three years. Simple orchiectomy and roentgen therapy have been combined. Patients who have lived beyond a five year period have been those with teratoma or seminoma. This experience bears out the findings expressed here today. The report of Lowry, Beard, Hewitt and Barner of 100 cases of testicular tumors seen in an army general hospital indicated better results from simple orchiectomy and roentgen therapy than those obtained by Lewis or ourselves. The last word has not yet been said about therapy of testicular tumors. Although it is a formidable procedure, it would seem rational to remove all retroperitoneal nodes along with the tumor in selected cases, and whenever possible. The 8 or 10 per cent increase possible in five year cures justifies this radical procedure. More careful pathologic diagnosis as well as classification of testicular tumors must be done in order properly to differentiate between those who should have the radical procedure done and those in whom roentgen therapy can be utilized with hope of cure.

DR. JOHN ORMOND, Detroit: I would like to find out whether I should adopt the radical operation. I should have to be thoroughly convinced that the results would be better than those which my associates and I have been obtaining. In our 40 cases which I have reviewed recently, every patient in whom there were no demonstrable metastases who was treated by simple orchiectomy followed by roentgen radiation is alive today. It is too early to tell about some of these patients; the time since operation is too short. Our series includes 3 patients with so-called chorioepithelioma, 2 of whom are living, 1 for about three years. The important thing to know is whether this operation is of use when there are demonstrable metastases. As to metastases, we took occasion to divide our patients arbitrarily into two groups, two age groups, taking age 30 as our arbitrary division point. Four fifths of those under 30 are dead, and the majority of those over 30 are still living. The interval between the onset or at least the apparent onset of the disease and the time that they consulted a physician was just half as long for the younger patients as it was for the older patients; yet the incidence of metastases in the younger patients was far greater than in the older patients. The profession and the laity have to be educated to the fact that any enlargement of the testis should be seen by a skilled man just as soon as it is discovered, and every case of hydrocele in the adult scrutinized carefully. The importance of this is evidenced by the following case: Two years ago, I removed a hydrocele on a man and, unfortunately, some bleeding occurred in the hematoma formation. We were following it rather closely. He came back this year and his testicular mass did not seem any larger than it was before, but as we lifted it up, it seemed just a little heavier. So with a good deal of trouble we persuaded the man to allow us to explore, and we found a malignant tumor and excised it, and I am sure we saved his life.

DR. LLOYD G. LEWIS, Washington, D.C.: Our statistics show that the results of radical orchiectomy for seminoma are little better than those of simple orchiectomy. We have not been able to cure any cases of chorioepithelioma. There are, however, in this series, 12 patients who had chorionic tumor of the cytotrophoblastic cells who had retroperitoneal glands removed, and these patients are living two years following surgical treatment. These are radioresistant tumors. I am glad that Dr. Ormond brought up the question of disproportionate weight of testicular tumors. That is an important sign. In the diagnosis of testicular tumor, we must insist on gentle bimanual palpation. The advantages of a million volt roentgen therapy machine lie in the fact that one can deliver the lethal tumor dose more rapidly than with the lower voltage machine. The lethal tumor dose for seminoma (1,000 roentgens) can be delivered to the retroperitoneal area in two weeks with the million volt machine, whereas it takes six weeks with the 250,000 volt machine. When radiation has to be prolonged, estimation of depth dosage cannot be accurately determined.

TOOTH DECAY IN RELATION TO DIET AND GENERAL HEALTH

NILS P. LARSEN, M.D.
Honolulu, Hawaii

Hawaii with its groups of people of many different racial backgrounds and varied food habits, its unusually mild, even climate and the abnormally high percentage of tooth decay in some groups and the freedom from decay in others presents an opportunity for dental observation that is rather unusual. The good health organization on the sugar plantations and the conditioning of the children over many years to medical examinations are a great aid to any human study.

Tooth decay is the most prevalent disease in the world. It is present at all ages, in all races and has been present throughout history. The Iron Age skulls show immunity to tooth decay; the Bronze Age skulls show 37 per cent with decay and 11 per cent of all the teeth decayed or missing; the ancient Egyptians' skulls showed 51 per cent with decay, and 5 per cent of the teeth decayed or missing, and the skulls of the Roman colonists show 85 per cent with decay and 29 per cent of the teeth decayed or missing.[1] At the present time Polynesians in Samoa show 4 per cent with tooth decay,[2] people in Tripolitania 49.89 per cent[1] and one group in Hawaii 99.9 per cent.[3]

In a study of 74 infants[4] on a rice diet almost 100 per cent showed tooth decay and almost 50 per cent of all erupted teeth were decayed. Of another group of 42 infants whose rice (acid residue starch) had been *replaced by taro and potatoes (alkaline residue starch)* only 7 per cent showed decay, and 4 per cent of the erupted teeth were decayed. Another observation[3] indicated that 22 Polynesian children eating their traditional poi and fish diet had almost perfect teeth (95.41 per cent free from decay), whereas 55 Polynesian children eating rice as their main food showed 98.2

Read before the Section on General Practice of Medicine at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 11, 1947

Evelyn Schoen organized the many clinics; Doris Larsen did the typing and checking, and nurses and teachers cheerfully helped with the work. The Medical Group Research Fund helped finance the project, which was under the jurisdiction of the Hawaiian Sugar Planters' Association Health Committee.

per cent with decay. It was also reported[5] at that time from the Island of Tristan da Cunha that among 156 miscegenetic persons eating largely potatoes and fish, 89 per cent had teeth free from decay. In another study on children with rampant decay in Hawaii the daily addition of carotene definitely reduced decay activity.[6] In a group of 779 Japanese children examined in Hawaii in 1930 only 2 had noncarious teeth.[3] In a group of 109 white children examined at the same time, 55.6 per cent were free of decay. They were of comparable ages. The white children ate much more of fruit and vegetables and less of the cereal starches. The water was the same for both groups.

These observations seemed to leave little doubt that diet was the cause of tooth decay, and it seemed logical, since a change from a high acid residue starch diet to a high alkaline starch diet almost completely corrected tooth decay, that the alkaline and acid factor of diet were important. This opinion seemed verified by certain experiments on dogs in which tooth decay became pronounced with the mere addition of acid radicals to the diet.[7] It was concluded in 1930:

> The evidence indicated that dental decay is primarily a systematic disorder, an imbalance perhaps in the tissue fluids and oral secretions, in the direction of a decrease of basic ions, either relative or absolute. . . . It is believed that any type of diet, any factor or combination of factors which tend to decrease the relative or absolute amount of base in the tissue fluids will proportionately increase the liability of the teeth to decay.

MATERIAL

The present study is based on the findings in 866 children between the ages 6 months to 18 years living on sugar plantations and examined in 1946, 180 children studied in 1947 in three selected kindergartens and 104 children recently arrived from the war-torn Philippines. Table 1 presents the number in each racial group. Although on the plantations the Japanese are the most numerous, present vital statistics show that Caucasians lead among the population groups in Hawaii, with 173,533 as compared with 168,463 Japanese.[8] There are only 10,000 surviving Hawaiians.

TABLE 1.—*Tooth Decay by Nationalities*

Nationality	No of Children	No of DMF*	Decay-Free Teeth	Percentage DMF* All Teeth	Percentage of Children with Decay-Free Teeth
Japanese	556	6,565	6,525	50	1.0
Filipino	226	2,147	4,111	34	5.6
Miscegenetic	102	905	1,441	38—	8.8
Chinese	44	430	552	43	6.3
Caucasian	44	286	641	31	11.3
Porto Rican	15	254	100	71	6.6
Korean	5	61	55	52	0.0
Hawaiian	4	68	28	70	25.0
New Filipinos	104	239	1,926	11	49.0
Totals	1,140	10,955	15,479	40	7.9

* Teeth decayed, missing or filled.

The Dental Research Committee[9] of the Honolulu Dental Association with the use of tongue blades, explorers, mouth mirrors and natural light made the dental examinations. Each had a secretary recording on a dental chart the type, location and degree of decay activity. Most of the children were given a general physical examination by the late Dr. H. Best and by me. A number had roentgen examination of the chest and other laboratory tests. Dietary histories were taken by trained personnel with the use of dietary forms.

The children were from three plantation groups and all except the new Filipinos were in a condition of vivacious health. Plantation group 1 was resident on a large sugar plantation. Group 2 was on a similar plantation, 8 miles (12.9 kilometers) away, but on which there had been a daily teaching diet clinic involving over 250 children since 1930. Group 3 was a selected plantation group in an English-speaking school located near group 1. Group 4 were newly arrived Filipinos who were undernourished, anemic and heavily infested with intestinal parasites.

RESULTS OF PHYSICAL EXAMINATION

The pertinent findings of the physical examination are given in table 2. The height and weight figures of the poorly nourished Filipino children actually show 10 per cent fewer in the underweight group for height than were found in the healthy children. However, when the figures are corrected for age, 75 per cent of the Filipinos are undersized compared with 34 and 44 per cent of the others.[10] The Filipinos have a high percentage of distended abdomens; more are rated thin; fewer have firm muscles, and most of them have large cervical glands. Yet the majority have normal-appearing tonsils, and 89 per cent of their teeth are free from decay. The local, and by comparison, healthy children's teeth are extremely poor. This suggests that general poor or good health is not related to tooth health, also that large cervical glands are possibly an indication of general poor health.

TABLE 2.—*General Physical Examination*

Condition	Percentages Plantation I	Plantation II	New Filipinos
Underweight by height	44	30	34
Underweight by height and age	34	44	75
Pathologic changes of skin	5	13	31
Rated thin	8	18	27
Firm muscles	62	66	9
Decayed teeth	99.2	95.9	51
Tonsils 1+ to 4+	43	73	37
Large cervical glands	2	17	66
Heart murmurs: total, 3.5			
Belly circumference larger than chest	0.8	7	23
Hemoglobin under 75	0	22	50
Preventive Inoculations (more than five)	50	90	0

Other findings of interest were 2 cases of mild rickets and 68 cases of Harrison's groove. The latter is frequently considered a sign of rickets, but in Hawaii, where children can be exposed to seven and one-half hours of sunshine daily, rickets is rare. It does occur in some young infants when racial fears and superstition keep them indoors. Harrison's groove is probably not an indication of rickets, but more likely an accompaniment of nasal obstruction or other breathing difficulty in the early years.

RESULTS OF DENTAL EXAMINATIONS

The dental examination indicated that of 20,492 teeth of plantation children 8,473, or 41 per cent, were decayed, missing or filled. The 180 kindergarten children had 3,677 teeth, of which 2,042, or 55 per cent were decayed, missing or filled. Among the 104 immigrant Filipinos only 11 per cent of the teeth were decayed, missing or filled (table 3). The percentage of decay in the permanent teeth in relation to age is given in table 4. This table also compares the Hawaii figures with those presented in the studies of Knutson,[11] as well as in a study from Panama.[12] The Hawaiian children have more tooth decay than any of the other groups.

Tooth Decay by Race.—Tooth decay by race is shown in table 1. Thirty-seven per cent of the teeth in 278 Filipino children reared in Hawaii were decayed against 11 per cent of the teeth in the newly arrived. Of the latter 48 per cent of the children were free of decay, whereas of the local Filipinos only 4.7 per cent had no decay. This observation changed an opinion which had been expressed in a previous paper [4]; namely: "A condition of excessive dental decay can be used as an indicator of a dietary fault. This fault is associated with a high infant mortality and morbidity." The Japanese with 50 per cent of all erupted teeth decayed and only 1 per cent with decay-free teeth are in sharp contrast to the Caucasians with 31 per cent decayed teeth and 11.3 per cent of whom have decay-free mouths. Both groups used the same water and both came from a temperate climate to a subtropical climate.

Location of Decay in the Mouth.—Regarding the location of decay in the mouth (fig. 1) it is evident that the upper incisor and canine teeth were more frequently decayed than the lower (upper incisors 82 per cent with decay to 17 per cent of the lower; upper canine teeth 64.5 per cent to 35.5 per cent of the lower). In the molars 5.4 per cent more lower teeth were decayed than upper. Although this latter seems a small difference, the chi square value indicates that the finding has a definite significance. The cleansing action of the tongue rubbing constantly against the lower incisors, less against the canine teeth and not at all on the molar, may be a factor to account for the differences. This may also account for the more frequent decay of the buccal surface than the labial.

GENERAL HEALTH

The health of the Hawaiian children, as shown by such criteria as infant and maternal mortality, general morbidity rate, deaths from beriberi and general appearance of well-being, had improved a great deal since 1930,[13] but their teeth were still poor. The forms for the mass diet survey were analyzed in toto by two physicians. However, the information as to how much each child drank of milk or ate of protein, fruit, vegetable, sweet and cereal came from the people in terms of times a day consumed or in cupfuls. Figure 2 contains a tabulation of the food eaten by 44 children with excellent teeth (0.7 decayed, missing or filled per mouth) and 60 children with poor teeth (17.3 decayed, missing or filled per mouth). As has been indicated, it is a comparison of times per day eaten rather than the measured amount consumed. The sweets and cereals are the only two food groups showing a striking difference. Considerably more of these were eaten by the group with poor teeth than by the other group. One surprising finding was the occasional inclusion of one to three bottles of "coca-cola" per day. Recent studies on rats, dogs and monkeys have shown cola drinks with a pH of 2.6 readily etching enamel, possibly the initial lesion of tooth decay. The addition of sugar to an acid greatly increases the damaging effect of the acid on enamel.[14] McCay and associates concluded, "Acid foods and beverages may be an important factor in the little understood phenomenon of human tooth erosion." A small amount of fluorine reduced this activity.

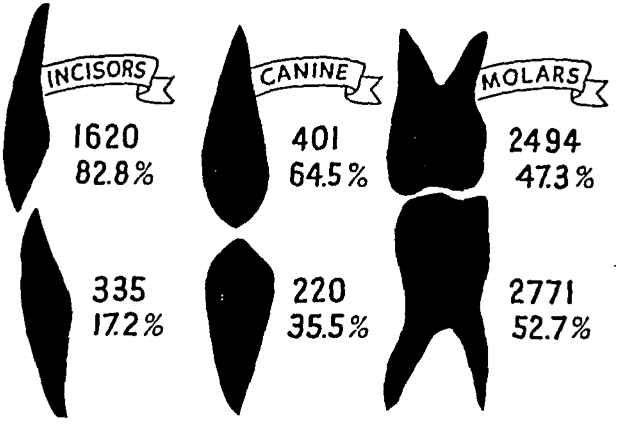

Fig. 1—Percentage of decay in upper and lower teeth, plantations 1 and 2.

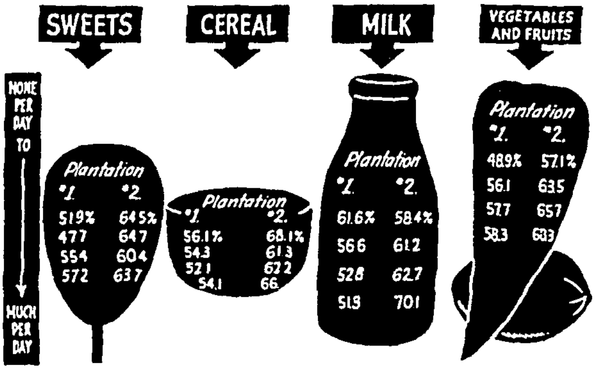

Fig. 2—Percentages of decay-free teeth on varying quantities of food

Figure 3 contains a tabulation of a careful one year diet study of ten Japanese plantation families on a low intake of protective food and ten families on a higher intake of protective food. Both groups (83 children) had poor dental health. However, when a measles epidemic struck, the children on the higher protective foods had half as many days of illness in bed and no serious complications. The other group had 3 deaths.[15] This may also suggest that immunity to decay is not related to ordinary resistance to disease. These diets are compared with a proposed minimum adequate diet as suggested by authorities in nutrition. The local Oriental diets are shown to be low in vegetables, legumes, fruits, milk and even sweets. They are high in cereals and proteins. Even those children whose diet in their early years was prepared by the Health Center (poi, milk and vegetable soup) soon reverted to their high rice diet. An examination was made of 239 children who were over 6 years of age and who had been fed in the first year or two at the Health Center. They had 5,824 teeth of which 2,377 were decayed, 40.81 per cent. There was only 1 perfect set. Four hundred and five children on the nonclinic plantations over 6 years old with 10,283 teeth showed 4,283 with decay, 41.65 per cent, a mathematically *insignificant* difference. Although these children get fruits and vegetables, they also get an abundance of bread and rice. An alkaline residue diet with daily excess in the ash equal to 80 to 100 cc. of normal solution (our previous recommendation for sound teeth) cannot be accomplished on rice three times a day. Although the daily Health Center feeding, along with a general increased intake of fruit and vegetables in the plantation diets and a decrease in rice,[16] helped the general well-being, the effect on tooth decay was negligible. The diet of the early years which produced a lowering of decay in the teeth did not produce a decay-resistant enamel. The "diet" plantation produced 66 per cent with perfect sets of teeth in the group 6 years of age and younger; 87 per cent of all the teeth were free from decay. In the same age group on the "nondiet" plantation 9 per cent of 127 children had perfect sets and 41 per cent of the teeth were free of decay.

---

[13] Filipino infant mortality was 220.3 in 1929, 29.5 in 1945; maternal mortality 6.87 in 1930 and 0.8 in 1945. Total death rate from beriberi was 18.8 in 1930, and 0.8 in 1945.[5]

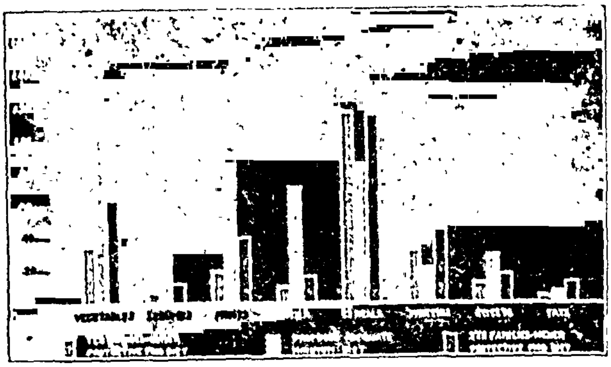

Fig. 3.—Comparison of diets; pounds of food as purchased per adult male unit per day.

POLYNESIAN AND ORIENTAL DIETS.

In a previous study the extreme dietary differences between the Polynesian and the Oriental was compared.[3] Here the difference seemed largely in the type of starch, rice being acid residue and taro being alkaline residue. In these groups there was a striking difference in tooth decay. The children on Polynesian diets had almost no decay, whereas the Polynesians on an Oriental or high rice diet showed 98.2 per cent with decay. Between these two extremes there was a mixture of these diet factors and also a rather mixed condition of tooth decay. The diets that fell between these two extremes were associated with a combination of good and bad teeth in varying percentages. This was shown in another study[6] in which the food eaten was carefully tabulated. Increasing amounts of taro, fruits and vegetables were called good, and increasing amounts of rice or bread were called bad. The children on "good" diets had 19 per cent of their teeth decayed, whereas those on "bad" diets had 47 per cent. Although there is a certain amount of variability in human beings there does come a point in dietary intake which in spite of other conditions (climate, sunshine, heredity, tooth structure, tooth cleanliness, water, etc.) is associated with excellent teeth and another level of dietary intake which is associated with almost 100 per cent tooth decay. Either of these diets is compatible with general good health.

FLUORINE AND OXALATES

Recent studies in Hawaii have shown that the water of the Territory is low in fluorine, 0.02 to 0.2 parts per million. According to Nekomoto,[17] "More serious development of caries by men enlisted at Scofield (Hawaii) than any other army post is consistent with low fluorine intake there—0.16." It has been shown that sea foods[18] are high in fluorine. It has also been shown that the oxalates present in taro and absent in rice give a form of surface protection (in rats) that apparently provides as much decay resistance as fluorine.[19] The possible importance of these two factors were unknown when the earlier observations were made. Perhaps their value in the role of prevention of tooth decay is as important as the previously mentioned acid-base factor.

66% of these 2958 TEETH were DECAY FREE

Fig. 4.—Saliva study on 321 children; aciduric bacteria in relation to diet.

ACIDURIC BACILLI

A bacteriologic study was conducted on 321 of these children by Dr. Floyd Hartmann of the University of Hawaii.[20] The studies were based on two or more samples of saliva. The child chewed paraffin for three minutes before spitting into a clean glass container. This was taken to the laboratory where 0.2 cc. was cultured in 5 cc. of bromocresol green dextrose agar. The cultures were read on each of the following four days. Specimens of sputum were cultured for types of bacteria, and the color test was checked with actual counts of the number of aciduric micro-organisms. The results verified the concept[21] that the simple color test is a good indicator of the number of aciduric bacilli present. Enright reported [22] :"The only micro-organism commonly found in food debris that can tolerate and produce additional acid in an environment below pH 5 . . . is a lactobacillus . . . its final pH . . . ranges from 3.6 to 4.8." Such acidity readily dissolves enamel. The color test was not found to be an index of production of acid by yeasts. When the color reading was low (0 to 2), indicating a low percentage of aciduric bacteria, 88 per cent of the teeth were free from decay. When the reading was high (3 to 4) 66 per cent of the teeth were free from decay (fig. 4).

Correlations were attempted relative to diet and the salivary study. Forty-seven per cent of the children had high salivary counts, and the majority were high cereal eaters. Sixty per cent of 143 children on a high cereal diet had high aciduric counts. The numbers in the other groups were too low to be significant, although the 11 high sugar eaters did have the highest aciduric percentages, 72. Fulton [23] stated that less than 1,000 lactobacilli per cubic centimeter indicates immunity to tooth decay; counts up to 15,000 moderate susceptibility, the higher the count the greater the susceptibility. This has been repeatedly verified but always with exceptions. Twelve per cent of the teeth in the present study associated wth low counts showed decay, and 66 per cent of the teeth with high counts showed no decay. Many observers have reported that lowering the intake of carbohydrate lowers the count and decreases decay. The Hawaiians with 50 to 80 per cent of their calories in the form of a soft, sticky carbohydrate showed a pronounced immunity to decay. Francis reported from Tripoli: "Although the natives in Tripoli have a higher carbohydrate diet than the whites, they have less caries." [1] Perhaps the acid-base values of the carbohydrates are important in relation to tooth decay. This evidence suggests that the term "carbohydrate" has been too loosely used in dental literature. From diet studies it was evident that the immigrant Filipinos had eaten freely of raw sugar with their food. They also ate rice as often as three times a day. It was a home threshed rice. Nevertheless the diet associated with such a low percentage of decay was high in carbohydrate and did contain considerable sugar. Did it contain sufficient protective elements?

COMMENTS

Collins and his associates [24] indicated that caries-immune students averaged an intake of 10.5 teaspoonfuls of sugar a day. (That would allow each per day one Hershey bar, three sticks of chewing gum, one marshmallow, one "life saver" and a tablespoonful of maple syrup). Caries-susceptible students averaged 18.2 teaspoonfuls. He reported that some of the high sugar eaters were immune to caries and some of the low sugar eaters had active caries. This would suggest that it was not the sugar, per se, but the excess of sugar when protective factors were absent. Excess intake of sugar tends to lessen the intake of other food, probably including protective substances. Further evidence is added by Percy Howe's 8 monkeys which were fed adhesive sugar balls twice daily for eight months with no caries developing.[22] Were protective factors, inhibitors of aciduric bacteria (oxalates, fluorine, acid neutralizers or vitamin K) present in sufficient amounts in these caries-immune mouths?

The reported observations in Hawaii suggest that other factors than the acid-base balance or vitamin A may account for the striking difference in decay in various groups of children observed. Heredity does not seem to play an important role in this condition. Hawaiians on the Polynesian diet for eight hundred years had excellent teeth, while first generation Hawaiians on the Oriental diet had poor teeth. Filipino children in Hawaii had much tooth decay, while Filipino children in the Philippines had little.[25] It did not seem to be a climate or "tropical" factor, since Hawaiians had excellent and poor teeth, Orientals extremely bad teeth and Caucasians fair teeth. It was not a roughage food factor, since Hawaiian poi is a soft, sticky, starch paste, more so even than rice. It also suggests that carbohydrates per se were not the causative factor. Sugar per se did not seem to be the factor, since many with severe decay were low sugar consumers, and vice versa. It was not a vitamin D deficiency since the Oriental as well as the Polynesian was exposed to seven and one-half hours of sunshine daily. Vitamin C did not seem to be a factor in the control of tooth decay. Scurvy is rare in Hawaii, where fruits are plentiful. Vitamin A seemed to have some influence but was not the whole factor. It is still recommended in pregnant women to affect favorably the development of the enamel organs.[26]

Fluorine may be a factor, since, although the water is the same for all races, the Hawaiians on their ancient diets consumed much sea food which is high in fluorine. They probably also swallowed more ocean water, which is high in fluorine. A Hawaiian brakish well showed 2.22 parts per million of sodium fluoride. They also ate much taro and poi, which is high in oxalate, a possible preventive of tooth decay, as might be vitamin K, present in raw sugar cane.[16] Perhaps the excellence of Eskimo teeth also came from the high fluorine content of their sea food. Sognnaes has added proof to that possibility in a recent report from Tristan da Cunha. The water of Tristan is low in fluorine, 0.2 parts per million; yet in 1938 when a potato shortage forced the people to eat a greater amount of fish, 15.8 per cent of the young people had white spots on their teeth (mild fluorosis), and teeth analyzed from Tristan were high in fluorine. A previous study [6] had shown no white spots. Coast natives of New Guinea eating more fish had less decay than inland natives, said Kilpatrick.[22] It indicates that sufficient and even excessive fluorine can at times be obtained from seat foods in sections where fluorine in the water is extremely low.

One hundred and fifty children with rampant decay are at present being studied with the ingestion of tablets [27] containing 2 mg. of calcium fluoride plus vitamins C and D.[28] At the end of four months there was little or no change in the aciduric color test, and the dentist's report was not convincing. More study is necessary.

Is it possible that high alkaline residue diets fill the enamel canals with alkaline dental lymph? With the addition of oxalate and fluorine to inhibit the growth of aciduric bacteria and prevent the resultant acid from etching the enamel, the tooth gets further protection. A rice diet producing dental lymph with a pH of 5 could enhance the growth of aciduric bacteria. The addition of oxalate and fluorine alone may be able to inhibit deleterious acid action, although in studies in cities[29] with water high in fluorine (caries experience rate 240) as against cities with water low in fluorine (caries experience rate 740), it would seem that something more than fluorine is needed to attain the perfection of the Hawaiian and Filipino teeth, and something besides the lack of fluorine seems necessary to account for the extremely decayed teeth of the Japanese. Recently the members of the dental profession have recommended painting each child's teeth twice a year with 2 per cent sodium fluoride solution. This, it is said, will reduce decay 40 per cent.[30] However, Ast cautioned, "Let us be patient to await conclusive evidence before we make up our minds on the merits of fluorine therapy."[31]

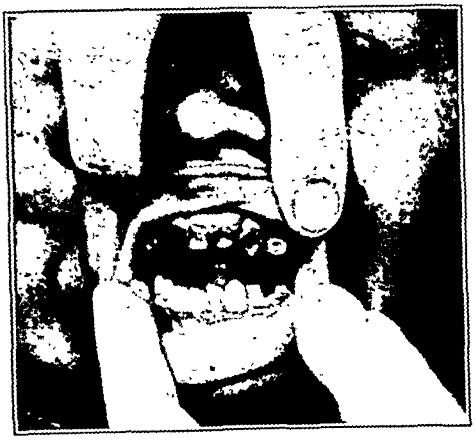

Fig. 5.—Odontoclasia, rampant enamel decay common in Hawaii.

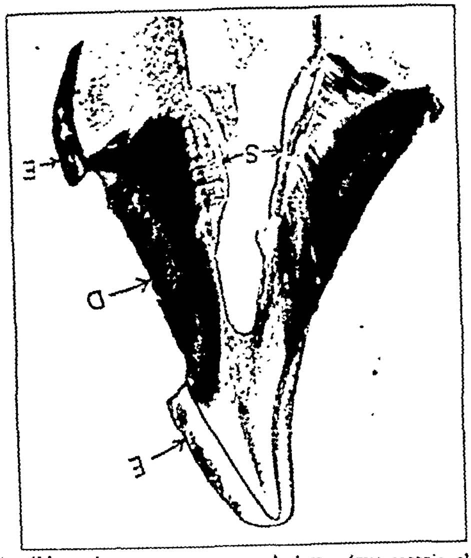

Fig. 6.—Odontoclasia, rampant enamel decay (microscopic slide prepared by Dr. C. Boedecker).

Factors which allow the uninhibited growth of aciduric bacteria and allow their products to etch enamel could be a starting point for decay. The deciduous teeth with larger canals in dentin and enamel and more protein substance in these canals allow a more rapid destruction of teeth, odontoclasia. This form of rampant enamel decay is frequently seen in Hawaii (figs. 5 and 6)

In the diet studies it sometimes took two months on a changed diet before the excretary fluids became alkaline. With some children the change occurred more rapidly; with others, more slowly.

To correct tooth decay by diet, the correction must be quantitative as in a change from large amounts of rice to large quantities of taro, or else there must be present the optimum of a protective factor. This protective factor must inhibit aciduric bacteria or the enzymes or neutralize the acid produced. Although the diet was greatly improved in the clinic children, rice was not eliminated, foods containing sufficient protective substance were not eaten, and no protection was obtained from the water with its low fluorine content. In spite of the improvement in the general health, there still remained a high percentage of tooth decay. The cause of tooth decay is not yet solved, but the quest is narrowing to fewer variables.

SUMMARY

Conditions producing good general health were found to be associated with severe tooth decay, and conversely, poor health was associated with excellent teeth. Harrison's groove is probably not caused by rickets, and height and weight values must be related to specific age levels to be of most value.

Heavy carbohydrate eaters (Polynesians on taro) had excellent teeth, and heavy carbohydrate eaters (Orientals on rice) had extremely poor teeth.

Hawaiian waters are low in fluorine; sea foods are high in fluorine and can affect teeth. Hence, people in areas with water low in fluorine may have good teeth with high fluorine content.

Oxalates high in taro and low in rice may be one of the factors favoring immunity from decay.

The observations in Hawaii tend to verify the role of aciduric bacteria as an index of decay immunity and that oxalates and fluorides, as well as the alkaline residue food values in the Hawaiian diet, might account for decay resistance in certain groups in Hawaii. These factors are more important in preventing decay than climate, heredity, cleanliness of the teeth or specific food factors including sugar.

APPENDIX

Diet of 2 Postwar Filipinos.—Two postwar Filipinos aged 3 years and 7 months and 4 years and 7 months, respectively, each had twenty perfect deciduous teeth. They ate rice (three times a day), had a sweet cake of rice flour and molasses rolled in banana leaves (twice a week), taro (three times a week), fruit and vegetables (four times a day), meat (twice a week) and candy (once a day); they chewed sugar cane frequently They drank no milk.

ABSTRACT OF DISCUSSION

Dr. William Wolf, New York: I should like to ask the essayist whether in the treatment of these children with the fluoride tablets it is not the menstruum which prevented the good results which he could have gotten perhaps by using it in different form. Dr. Samuel Charles Miller in New York has done considerable study in this line, and I was wondering what the essayist's experience has been in using fluorine in a different form, such as in solution without sugar content. It seems, according to Dr. Miller, that the sugar content of the tablets nullifies much of the good effects of the fluorine.

Dr. Sixto Y. Orosa, Manila, Philippine Islands: Allow me to extend to you the greetings of over 5,000 Filipino physicians in active practice. Now coming to the paper, may I say that the pictures shown of 2 Filipino children are hardly typical of the ordinary Filipino children. It is true that during the Japanese occupation and even now after we have been liberated by America, we still have undernutrition and the effects of undernutrition, such as tuberculosis. During the occupation the Japanese got every particle of food and other things that they could get hold of from us, and I really do not know how we have managed to live up to now. It is easy to understand why malnutrition was common during the Japanese occupation and, as I said, following malnutrition were diseases such as beriberi, tuberculosis and heart disease.

[29] Dean, H T.; McKay, F. S.; Armstrong, W. D.; Bibby, B. G. and Ast, D., in Symposium on Fluorine in Dental Public Health, New York, Institute of Oral Pathology, 1944, p. 25.
[30] Treatment to Check Decay, Science New Letter **51**: 180, 1947.
[31] Ast, D B., New York J. Dentistry **15**: 8, 1946.

Dr. Nils P. Larsen, Honolulu, Hawaii: As to the question of some other form of fluorine, I think that might be preferable. The fact that some dentists have been able to paint a 2 per cent solution of sodium fluoride on one half of the teeth and not on the others, and produce a 40 per cent decrease of decay on the treated side only, would indicate that if one had a fluorine product that would absorb well into the enamel perhaps one could better the results. However, perhaps my associates and I should have waited longer, but we did not have time. If we go by the literature—of course, we must be careful after Dr. Alvarez' paper in depending too much on these scientific and laboratory reports. Nevertheless, if one has not been able to influence in four months the aciduric bacteria of the mouth, one has no right to assume that the calcium fluoride tablets will succeed later in reducing tooth decay. As to the gentleman from the Philippines, we appreciate with deep feeling the terrific suffering which the Filipinos have experienced. Over 12,000 Filipinos had to be checked to get 6,000 able to work on our plantations. We picked two of the children who illustrated the distended abdomens and soft muscles which we found in the majority of those examined. However, in spite of the fact that these children were in such poor condition, due to the horrors of the war and the starvation they had to go through, of the total number of teeth in these 104 Filipino children, only 11 per cent showed decay and 48 per cent of the children had perfect mouths. The point there is that the right food for teeth is not necessarily the right food for good general health.

EFFICIENCY OF GASTROINTESTINAL TRACT AFTER RESECTION OF HEAD OF PANCREAS

ERIC E. WOLLAEGER, M.D.,
MANDRED W. COMFORT, M.D.,
O. THERON CLAGETT, M.D.,
and
ARNOLD E. OSTERBERG, Ph.D.,
Rochester, Minn.

When resection of the head of the pancreas is carried out, partial gastrectomy, total duodenectomy and some sort of anastomosis between the biliary tract and the stomach or small intestine are integral parts of the operative procedure. Such extensive surgical operations cannot be done without interfering to some degree with the normal functioning of the gastrointestional tract. It was the purpose of this study to assess the degree of impairment of the digestive and absorptive functions of the gastrointestinal tract brought about by this operation and to evaluate ways by which such impairment of function could be reduced. This was done by means of intake-excretion studies with standard test diets. Similar studies of normal persons had previously been carried out with two of the same test diets for control purposes.

SUBJECTS STUDIED

Ten patients who had undergone resection of the head of the pancreas consented to be studied. Two of them (cases 4 and 5) had been operated on for severe chronic pancreatitis. The other 8 had been operated on for carcinoma, which was situated at the ampulla of Vater in 4 cases (cases 1, 2, 3 and 8), in the duodenum in 1 case (case 7) and in the head of the pancreas in 3 cases (cases 6, 9 and 10). Figures 1 and 2 illustrate diagrammatically the surgical procedure which had been carried out in each case. In 3 cases (cases 1, 2 and 3) the pancreatic ducts had been ligated, thus preventing the flow of pancreatic juice into the gastrointestinal tract. In 1 case (case 4), the remaining portion of the pancreas was anastomosed to the stomach and in 6 cases (cases 5, 6, 7, 8, 9 and 10) it was anastomosed to the jejunum. Further pertinent clinical data concerning the 10 patients are summarized as follows:

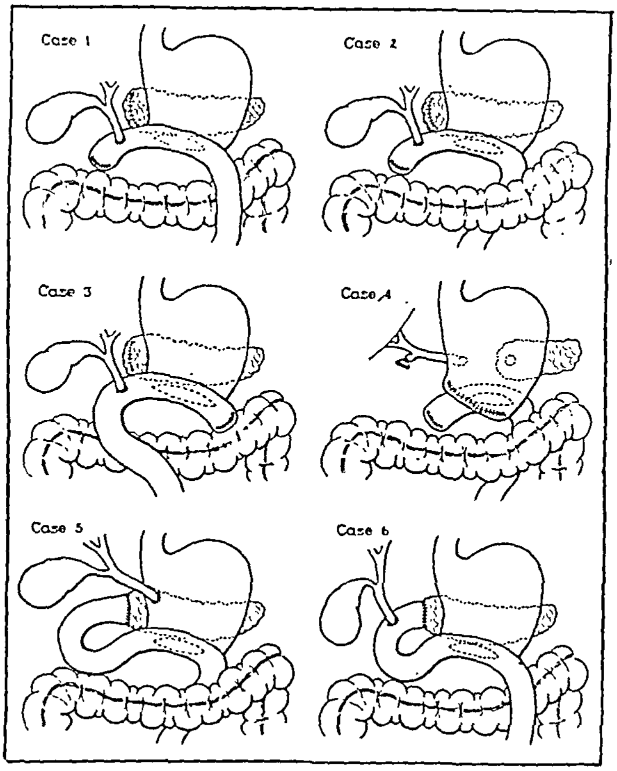

Fig. 1—Diagrammatic representations of the upper part of the gastrointestinal tract after the surgical procedures carried out in cases 1 through 6.

Case 1.—The patient, a man aged 30 years, complained that he had had easy fatigability for one year and jaundice for two months. He stated that cholecystoduodenostomy had been performed six weeks prior to his examination at the Mayo Clinic. Resection of the head of the pancreas, the distal 8 cm. of the stomach and 15 cm. of the duodenum was performed on April 18, 1944. The pathologic diagnosis was multicentric mucous adenocarcinoma, grade 1 (Broders' method), involving the ampulla of Vater, common bile duct and pancreatic duct. Intake-excretion studies were begun one month after operation. The patient was having two or three bowel movements per day and made no complaints con-

---

Dr. Osterberg is now at Abbott Laboratories, North Chicago, Ill.

Read in a Symposium on the Pancreas before the Section on Gastro-Enterology and Proctology at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J. June 11, 1947.

cerning his abdomen. His weight was 121 pounds (54.9 Kg.) as compared to a customary weight of 170 pounds (77.1 Kg.) before the onset of his illness. A letter from the patient in March 1946 stated that he was feeling well and weighed 145 pounds (65.8 Kg.). He was taking fifteen pancreatin tablets (5 grains [0.3 Gm.] each) per day. A letter in January 1947 stated that he was becoming jaundiced.

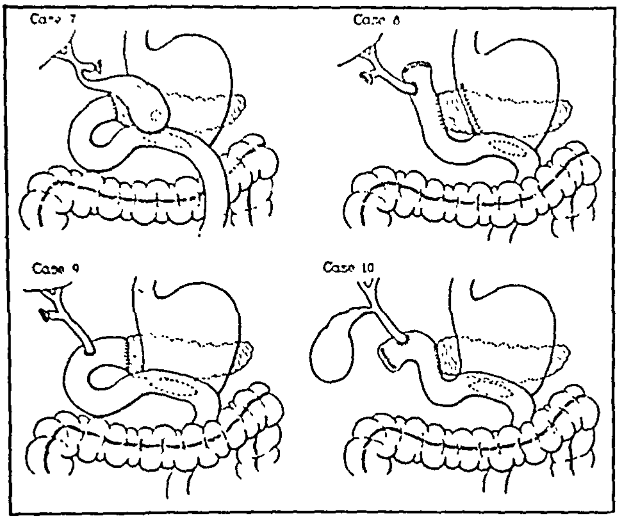

Fig. 2--Diagrammatic representation of the upper part of the gastrointestinal tract after the surgical procedures carried out in cases 7 through 10.

CASE 2.--The patient, a woman aged 54 years, complained that she had had epigastric distress, occasional vomiting and constipation for one year. She had lost 25 pounds (11.3 Kg.). Two years previously she had undergone cholecystogastrostomy at the Mayo Clinic because of jaundice of two weeks' duration. A tumor of the head of the pancreas had been found at that time. Resection of the head of the pancreas along with the distal 15 cm. of the stomach and 36 cm. of duodenum and jejunum was carried out on Jan. 13, 1945. The pathologic diagnosis was adenocarcinoma, grade 1 (5 by 3 by 1 cm.), of the ampulla of Vater, with extension into the head of the pancreas. Intake-excretion studies were carried out six months later. The patient had gained 7 pounds (3.2 Kg.) since operation. She took fifteen enteric-coated tablets of pancreatin with each meal. She made no complaints concerning her abdomen and passed one or two stools per day. Her weight was 97 pounds (44.0 Kg.). Her customary weight before her illness had been 130 pounds (59.0 Kg.). When last heard from, in January 1947, the patient stated that she was feeling well. She was taking fifteen pancreatin tablets (5 grains [0.3 Gm.] each) with each meal. Her weight was 112 pounds (50.8 Kg.).

CASE 3.--The patient, a woman aged 67 years, complained that she had had abdominal pain and a loss of 30 pounds (13.6 Kg.) during the previous year. Resection of the head and a portion of the body of the pancreas along with the distal 6 cm. of the stomach and 11 cm. of the duodenum was carried out on March 9, 1944. The pathologic diagnosis was adenocarcinoma, grade 1 (7 by 5 by 3 cm.), of the ampulla of Vater. Intake-excretion studies were carried out one year later. At this time she complained of diarrhea with passage of six to eight large stools a day since her operation. There had been a 15 pound (6.8 Kg.) loss of body weight. Diabetes mellitus had been discovered seven months after operation and had been controlled with 6 units of protamine zinc insulin and 12 units of regular insulin per day. The patient's average weight before her illness had been 155 pounds (70.3 Kg.). Her weight at the time of study was 113 pounds (51.3 Kg.). When last heard from, in December 1946, the patient stated that she was feeling well, was having normal elimination and weighed 130 pounds (59.0 Kg.). She was taking five pancreatin tablets (5 grains [0.3 Gm.] each) with each meal.

CASE 4.--The patient, a man aged 40, complained that he had had recurring attacks of severe abdominal pain for nine years. He stated that for this pain he had undergone cholecystostomy in 1935, cholecystogastrostomy in 1936 and gastroenterostomy in 1940. Resection of the head of the pancreas, the distal 3 cm. of the stomach and 14 cm. of the duodenum and removal of the gallbladder were performed on Dec. 7, 1944. The pathologic diagnosis was pancreatitis, grade 4 (on the basis of 1 to 4, in which 1 designates the mildest and 4 the most severe condition). At the time of operation the entire pancreas was found to be decidedly fibrosed and its ducts were dilated. Biopsy of the body of the pancreas showed chronic pancreatitis, grade 4. Two months after operation analysis of gastric contents after stimulation by an Ewald test meal revealed no free hydrochloric acid. After stimulation with histamine there was no free hydrochloric acid in the first four specimens of gastric contents withdrawn at ten minute intervals but in the fifth, sixth and seventh there were 10, 20 and 26 units of free hydrochloric acid respectively. A secretin test with the tube in the stomach revealed the pH of the gastric contents to vary between 6.4 and 6.6 before administration of secretin and from 6.4 to 7.2 after its administration. There was some diastase and tryptic activity after stimulation but the amounts were subnormal. Intake-excretion studies were carried out two months after operation. The patient had gained about 10 pounds (4.5 Kg.) since operation and was having two bowel movements per day. His weight was 132 pounds (59.9 Kg.). His customary weight before the onset of his illness had been 138 pounds (62.6 Kg.). The patient returned to the clinic for examination in May 1945 and January 1946. Both times his main complaint was of persistent edema of the ankles. He had experienced no recurrences of abdominal pain. His bowels moved five or six times a day even when he took fifteen tablets (5 grains [0.3 Gm.] each) of pancreatin with each meal. There was evidence of chronic renal disease, which was thought to be the main cause of his edema. Insufficiency of external pancreatic secretion with malnutrition was considered to be a contributing cause. There had been no loss of weight (weighed when edema free).

CASE 5.--The patient, a man aged 37 years, complained that he had had recurring attacks of severe pain in the upper part of the abdomen for fifteen years. Resection of the head of the pancreas, the distal 5 cm. of the stomach and 15 cm. of duodenum was performed on Jan. 19, 1945. The pathologic diagnosis was pancreatitis, grade 4, with pancreatolithiasis. Intake-excretion studies were carried out six months after operation. The patient had experienced two attacks of pain in the upper part of the abdomen since operation. He weighed 125 pounds (56.7 Kg.), a loss of 10 pounds (4.5 Kg.) from his usual preoperative weight of 135 pounds (61.2 Kg.). He complained of diarrhea with four to six large stools a day.

In February 1947, the patient returned to the Mayo Clinic because of recurring attacks of severe pain in the upper part of the abdomen without jaundice for eight months. At surgical exploration he was found to have an inflamed gallbladder containing one stone. This organ had been found to be normal at the time of his previous operation. Cholecystectomy was performed. The previously made choledochogastric stoma was disconnected and the common bile duct was *anastomosed to the jejunum*. The remaining portion of the pancreas appeared normal.

CASE 6.—The patient, a man aged 41 years, complained that he had lost 30 pounds (13.6 Kg.) in ten months and had had diarrhea for three months and jaundice for one month. Resection of the head of the pancreas, the distal 5 cm. of the stomach and 20 cm. of the duodenum and jejunum was performed on May 22, 1945. The pathologic diagnosis was adenocarcinoma, grade 2 (5 by 4 by 3 cm.), of the head of the pancreas. Intake-excretion studies were carried out one month after operation. He was having two or three bowel movements a day. He made no complaints concerning his abdomen. His weight at the time of the study was 134 pounds (60.8 Kg.), whereas his usual weight prior to his illness had been 170 pounds (77.1 Kg.). After this study, the patient gained weight to 170 pounds (77.1 Kg.), taking two pancreatin tablets (5 grains [0.3 Gm.] each) before meals. In February 1947, a letter from him stated that he was in fairly good health, weighed 160 pounds (72.6 Kg.) and passed loose light-colored stools. He was able to do sedentary work. He had continued to take pancreatin.

CASE 7.—The patient, a man aged 48 years, complained that he had had recurring episodes of anemia for one year. The anemia responded readily to administration of iron. Resection of the head of the pancreas, the distal 5 cm. of the stomach and 15 cm. of the duodenum was performed on May 29, 1945. The pathologic diagnosis was adenocarcinoma, grade 1 (8 by 5 by 2 cm.), of the duodenum. Intake-excretion studies were carried out (tables 1 and 2, patient 7, period 1), two months after operation. The patient made no complaints referable to the abdomen. He was having one bowel movement per day. His weight was 146 pounds (66.2 Kg.) as compared to his usual weight of 175 pounds (79.4 Kg.) before his illness.

After this study the patient's weight increased to 153 pounds (69.4 Kg.) without pancreatin. He returned to the clinic in June 1946, complaining of recurring attacks of epigastric pain, fever, chills and jaundice. Abdominal exploration was carried out on June 26, 1946. The cholecystogastric stoma was not functioning because the cystic duct was obstructed by an extrinsic inflammatory mass. A fistula had formed between the lower end of the common duct and the duodenum. The cholecystogastric stoma was disconnected, the gallbladder was removed and the common bile duct was anastomosed to the jejunum. A diagram of the upper part of the gastrointestinal tract after this operation is essentially the same as that represented in figure 2 for patient 9. Intake-excretion studies were carried out four weeks after this operation (tables 1 and 2, patient 7, period 2). The patient weighed 143 pounds (64.9 Kg.). He was having no abdominal symptoms. His bowels moved once each day. When last heard from, in March 1947, he was in good health.

CASE 8.—The patient, a woman aged 51 years, complained that she had had epigastric pain, anorexia and loss of weight for six months. Resection of the head of the pancreas, the distal 10 cm. of the stomach and 15 cm. of the duodenum was carried out on Sept. 7, 1945. The pathologic diagnosis was adenocarcinoma, grade 2 (3 by 2 by 1 cm.), of the ampulla of Vater. Intake-excretion studies were carried out three weeks after operation. The patient was having three to five bowel movements a day, but she had no other complaints. Her weight was 119 pounds (54.0 Kg.), as compared with a usual weight of 145 pounds (65.8 Kg.) before her illness. The patient did well for five months after study

and then began to have pain in the right upper part of the abdomen. She died from abdominal carcinomatosis in December 1946.

CASE 9.—The patient, a man aged 64 years, complained that he had had diarrhea for four months, epigastric pain for six weeks and loss of weight for five months. He stated that two months before he came to the clinic choledochostomy with T tube drainage had been carried out because of jaundice of three weeks' duration. Resection of the head of the pancreas, the distal 9 cm. of the stomach and 15 cm. of the duodenum was performed on Aug. 29, 1945. The pathologic diagnosis was mucous adenocarcinoma, grade 1 (3 by 3 by 3 cm.), of the head of the pancreas. Intake-excretion studies were carried out three weeks after operation. He was having two to four bowel movements each day, but he had no other complaints referable to his abdomen. His weight was 106 pounds (48.1 Kg.) as compared to a usual weight of 145 pounds (65.8 Kg.) before the onset of his illness.

After this study the patient did well for four months, gaining weight to 135 pounds (61.2 Kg.). In January 1946, he began to have abdominal pain, and in March 1946 he died of a recurring malignant lesion.

* All subjects were taking a test diet containing 101.6 Gm. fat and 117.5 Gm. protein (18.9 Gm. nitrogen) per day.

† Intakes of nitrogen of more than 18.9 Gm. per day were due to nitrogen contained in pancreatin.

‡ Fifteen grams pancreatin in enteric-coated tablets was administered daily except in period 3, patient 4, in which 15 Gm. powdered pancreatin in tomato juice was administered daily.

§ Period 3 of patient 4, period 2 of patient 7 and period 2 of patient 10 are not included in the averages.

CASE 10.—The patient, a man aged 58 years, complained that he had had abdominal pain for ten months and jaundice for four months. His body weight had decreased from 206 pounds (93.4 Kg.) to 134 pounds (60.8 Kg.) in this time. Preliminary cholecystogastrostomy was performed on Dec. 16, 1944. Resection of the head of the pancreas, 8 cm. of the distal portion of the stomach and 16 cm. of the duodenum and jejunum was performed on Feb. 2, 1945. The pathologic diagnosis was adenocarcinoma, grade 1, of the head of the pancreas. Intake-excretion studies were carried out three weeks after the second operation (tables 1 and 2, patient 10, period 1). The patient made no complaints. He was having two formed stools a day. His weight was 143 pounds (64.9 Kg.).

After this study the patient did well, his weight increasing to 152 pounds (68.9 Kg.) six months after operation. In February 1946, he returned complaining of loss of 20 pounds (9.1 Kg.) and pain in the upper part of the abdomen for one month. He was having two normal stools a day. Intake-excretion studies were carried out (tables 1 and 2, patient 10, period 2). Shortly thereafter, abdominal exploration revealed recurring carcinoma. The patient died in January 1947.

DIETS

Four different test diets were employed in this study, the compositions of which have been summarized in table 3. They consisted of bland, easily digestible foods, low in bulk, which were served in three meals supplemented by several smaller between meal feedings each day. All food was weighed. The fat and protein (nitrogen x 6.25) content of diets 1 and 4 were determined by three separate analyses of these diets. Except for these analyzed values the content of carbohydrate, fat and protein of the four diets was calculated from standard tables. A detailed description of diets 2 and 3 has been presented elsewhere.[1] Diets 1, 2 and 3 differed from each other mainly in their fat and carbohydrate content, since the amount of protein and the number of calories in them were not greatly different. They represented a diet of low fat content, a diet of moderate fat content and a diet of high fat content respectively. Diets 2 and 4 differed from each other mainly in their protein and carbohydrate content, since the amount of fat and the number of calories in them were practically the same. They represented a diet of high protein content and a diet of low protein content respectively.

TABLE 3.—*Approximate Composition of Test Diets Per Day*

Diet	Fat, Gm.	Protein, Gm.	Carbohydrate, Gm.	Calories
1	44	123	379	2,405
2	102	118	270	2,463
3	208	98	141	2,823
4	106	61	325	2,497

In order to reduce the tedium of diets when given over long periods of study, three daily menus were arranged for diets 1, 2 and 4 and were fed in a constant order of rotation. Diet 3 was fed over a three day period of study to only 1 patient. The menu of this diet did not vary from one day to the next. In all studies, it was required that all food be eaten.

Miss Lida Burrill, Chief Dietitian, Nutrition Laboratory, St. Marys Hospital, planned and supervised the diets used in this study.

PROCEDURE AND LABORATORY METHODS

The procedures and laboratory methods were the same as those previously employed, which have been described in detail.[1b] All studies were carried out in the Metabolic Study Unit at St. Marys Hospital. With few exceptions the periods of study were six days in length. Collections of stools were made with the help of carmine markers. The subjects ate the test diet during the two days prior to the administration of the first marker and remained on the diet until the second marker appeared in the stool. Feces were analyzed for total solids, fat (total lipid) and nitrogen. All urine passed during the periods of study was collected and analyzed for nitrogen.

The following intake-excretion studies were carried out:

1. Each patient in the entire group of 10 patients was studied with the moderately high fat test diet (diet 2), which had previously been used for the study of 11 normal subjects. A direct measure was thereby obtained of the degree of functional impairment of the gastrointestinal tract after resection of the head of the pancreas. Furthermore, this study made possible a comparison between cases in which the external secretion of the pancreas was prevented from entering the gastrointestinal tract (cases 1, 2 and 3) and those in which an attempt was made to establish a flow of pancreatic juice into the gastrointestinal tract by anastomosing the remaining portion of the pancreas to the stomach (case 4) or to the jejunum (cases 5, 6, 7, 8, 9 and 10).

2. With the same test diet, 4 patients with pronounced impairment of gastrointestinal function (cases 1, 2, 3 and 4) were studied while they were taking pancreatin in doses of fifteen enteric-coated tablets with each of three meals per day.[2] A direct comparison of results with and without pancreatin while the patients were taking the identical diet was therefore possible. One patient (case 4) was also studied while taking 5 Gm. of powdered pancreatin in tomato juice with each of three meals a day. This patient was found to have no free hydrochloric acid in the gastric contents after an Ewald test meal.

3. Five patients (cases 1, 2, 5, 6 and 9) were studied on a low fat diet (diet 1) and one patient (case 6) was in addition studied on a high fat diet (diet 3). With the results obtained from studies on the moderately high fat diet (diet 2), it was thereby possible to compare fecal total solids, fat and nitrogen at three levels of fat intake.

Four patients (cases 1, 6, 8 and 9) were studied on a low protein diet (diet 4). With the results obtained from studies on a high protein diet (diet 2), it was thereby possible to compare fecal losses of total solids, fat and nitrogen at two levels of protein intake.

No control studies of normal subjects have have been carried out with the low fat or low protein diets (diets 1 and 4), but control studies with the high fat test diet (diet 3) and the moderately high fat test diet (diet 2) have previously been published.[1]

RESULTS

In tables 1 and 2 are summarized the results of all studies in which the moderately high fat diet (diet 2) was employed with and without pancreatin. Table 1 is concerned with fecal total solids and fat, while table 2 is concerned with fecal and urinary nitrogen and the nitrogen balance. For the sake of comparision, the average fecal values obtained from the study of a series of normal persons on the same test diet were included at the bottom of these tables.

The degree of impairment of gastrointestinal function was considerable. The average amount of total fecal solids among all 10 patients when not taking pancreatin was 100.4 Gm. per day as compared to an average of 27.6 Gm. per day among the 11 control subjects. The 10 patients lost on an average of 48.4 Gm. of fat per day, or 47.6 per cent of the fat ingested. The control subjects, on the other hand, lost an average of only 4.1 Gm. of fat per day, or 4.0 per cent of the fat ingested. Fat constituted a higher percentage of the total fecal solids among the 10 patients than it did among the controls—an average of 48.2 per cent as compared to an average of 14.8 per cent. Fecal nitrogen averaged 6.8 Gm. per day among the patients and constituted 36.2 per cent of the nitrogen intake. Among the control subjects fecal nitrogen averaged 1.7 Gm. per day and constituted 8.8 per cent of the ingested nitrogen.

A Study of Normal Persons Taking a Test Diet Containing a Moderate Amount of Fat; Comparison with Results Obtained with Normal Persons Taking a Test Diet Containing a Large Amount of Fat, Gastroenterology 9: 272-283 (Sept.) 1947. (b) Wollaeger, E. E.; Comfort, M. W.; Weir, J. F., and Osterberg, A. E.: The Total Solids, Fat and Nitrogen in the Feces: I. A. Study of Normal Persons and of Patients with Duodenal Ulcer and a Test Diet Containing Large Amounts of Fat, ibid., 6:83-92 (Feb.) 1946.

[2] Wilson Laboratories, Chicago. Each tablet contained 5 grains (0.3 Gm.) pancreatin.

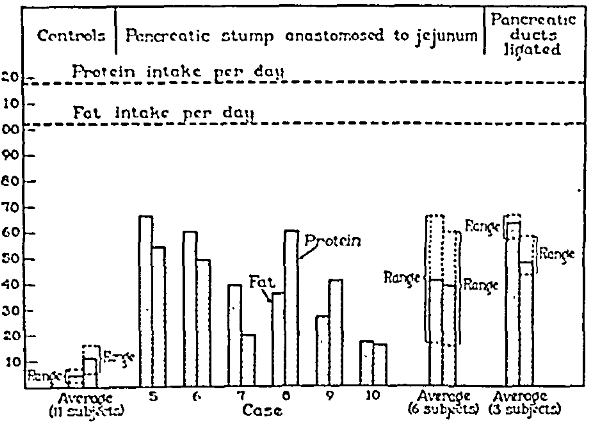

Fig. 3—Fecal losses of fat and protein (nitrogen times 6.25) after resection of the head of the pancreas. Effect of anastomosing the stump of the pancreas to the jejunum. All subjects were taking a test diet containing 101.6 Gm. of fat and 117.5 Gm. of protein per day.

Figure 3 compares the fecal losses of fat and protein among 3 patients whose pancreatic ducts had been ligated (cases 1, 2 and 3) with fecal losses of fat and protein among 6 patients (cases 5, 6, 7, 8, 9 and 10) in whom the the remaining pancreas had been anastomosed to the jejunum. For convenience fecal nitrogen values have been multiplied by 6.25 and expressed as protein. The three patients whose ducts had been ligated lost in the feces on an average 63 of the 102 Gm. of fat and 48 of the 118 Gm. of protein ingested per day. The range of loss of both fat and protein was not wide. Among the 6 subjects in whom the remaining portion of the pancreas had been anastomosed to the jejunum, on the other hand, the fecal losses of fat and protein varied a good deal. They ranged from values equal to those of the patients whose pancreatic ducts had been ligated to values only slightly above normal.

The effect of the oral administration of pancreatin on the fecal fat and protein (nitrogen x 6.25) of 4 patients is shown in figure 4. In every instance fecal losses of fat and protein were definitely and substantially reduced by administration of pancreatin. In the case of fat the average reduction was 44.6 per cent and in the case of protein it was 53.4 per cent. Without pancreatin the average loss of fat was 59.9 Gm. per day; with pancreatin it was 32.5 Gm. Without pancreatin the average loss of protein was 47.5 Gm. per day; with pancreatin it was 21.9 Gm. The ranges of loss of fat and protein when pancreatin was administered did not overlap the ranges of loss when none was given.

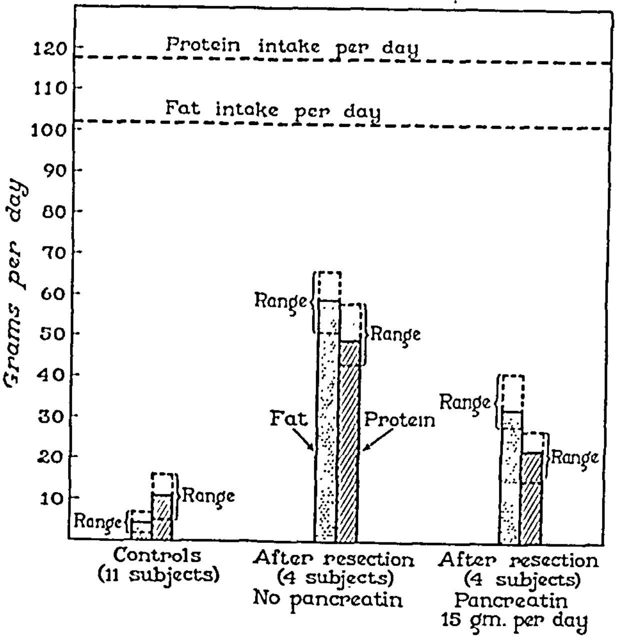

Fig. 4—Fecal losses of fat and protein (nitrogen times 6.25) after resection of the head of the pancreas. Effect of pancreatin. All subjects were taking a test diet containing 102 Gm. of fat and 118 Gm. of protein per day.

An examination of table 1 reveals that pancreatin effected an average reduction in total fecal solids from 119.7 Gm. per day to 78.8 Gm. per day. This constituted a reduction of 32.6 per cent. The percentage of the total fecal solids which was fat was reduced only 16.8 per cent by pancreatin. This indicates an almost parallel reduction of the fatty and nonfatty solid constituents of the feces. In terms of percentage of ingested fat lost in the feces, pancreatin reduced fecal fat losses from 59.0 per cent to 32.0 per cent.

A further evidence of the value of pancreatin in improving the function of the gastrointestinal tract was obtained from studying the values for urinary nitrogen (table 2). Without pancreatin the average urinary excretion of nitrogen was 7.9 Gm. per day. With pancreatin it was 12.0 Gm. per day. Although the nitrogen content of pancreatin (1.6 Gm. in the daily dose) increased the nitrogen intake during the periods in which pancreatin was being administered, this did not explain the entire increase of urinary excretion of nitrogen during these periods. Some of this increase was no doubt due to improved assimilation of nitrogen from the gastrointestinal tract.

The effect of three different levels of fat intake on the fecal total solids, fat and nitrogen is shown in table 4 and in figure 5. (In figure 5 fecal nitrogen values have been multiplied by 6.25 and expressed as fecal protein.) When the fat content of the diet was increased there was a pronounced rise in the fat content of the feces, which was accompanied by a corresponding rise in the total fecal solids. With diet 1, the average loss of fat was 21.9 Gm. per day. With diet 2, the average loss was 57 Gm. With diet 3, the loss was 146 Gm. in the 1 patient studied on this diet. This was in contrast to the results with normal subjects, in whom a loss of fat of 4.1 Gm. per day on the moderately high fat test diet (diet 2) was increased to only 8.7 Gm. per day when the high fat test diet (diet 3) was given.[1a]

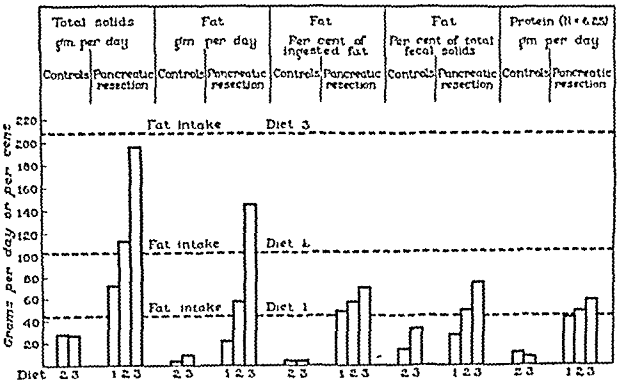

Fig. 5—The effect of various levels of fat intake on total solids, fat and protein in the feces after resection of the head of the pancreas. The control values are averages for 11 subjects who took diet 2 and for 13 subjects who took diet 3. The values for pancreatic resection are averages for 5 subjects who took both diets 1 and 2 and the values for 1 subject who took diet 3.

Among patients who had undergone resection of the head of the pancreas, an increase in the dietary intake of fat was accompanied by a slightly more than corresponding increase in the amount of fecal fat. Consequently the percentage of ingested fat lost in the feces was only slightly increased (48.7 per cent with diet 1, 56.1 per cent with diet 2 and 70.2 per cent with diet 3). On the other hand the percentage of fat in the total fecal solids was substantially increased (29.9 per cent with diet 1, 49.2 per cent with diet 2 and 74.5 per cent with diet 3).

Somewhat similar results were observed in the control studies with diets 2 and 3. Among these normal subjects doubling the fat intake per day resulted in a doubling of the fecal fat loss, so that there was no difference in the percentage of ingested fat lost in the feces with the two diets. The percentage of fat in the total fecal solids, on the other hand, was considerably greater with the high fat diet than with the moderately high fat diet.[1a]

Although fecal losses of fat among patients who had undergone pancreatic resection were greatly increased by increasing the dietary content of fat, fecal losses of protein were not greatly augmented by the large fat losses (fig. 5). They averaged 41.9 Gm. per day on diet 1, 48.8 Gm. per day on diet 2 and 57.5 Gm. per day on diet 3.

In table 5 is shown the effect of two different levels of protein intake on the fecal total solids, fat and nitrogen of patients who have undergone resection of the head of the pancreas. The losses of fat were essentially the same with the two diets. The fecal total solids were slightly greater with diet 2 (high protein) than with diet 4 (low protein). However, the major difference in the results from the two diets was found in the nitrogen content of the stools. With the high protein diet the fecal nitrogen averaged 7.6 Gm. per day and with the low protein diet it averaged 4.7 Gm. per day. In other words, a high level of protein intake resulted in a greater loss of protein in the feces than did a low level of intake. Figure 6 demonstrates that an increase in the amount of fat or protein in the diet resulted in an increase in the quantities of fat or protein absorbed in spite of a great wastage in the feces. With diets 1, 2 and 3, 22.8, 44.6 and 62.0 Gm. of fat per day were absorbed respectively. With diets 4 and 2, 31.6 and 70 Gm. of protein were absorbed respectively.

In table 2 are presented the nitrogen balances of all 10 patients while taking diet 2 both with and without pancreatin. In every case the balances were positive, even when fecal losses of nitrogen were large. With pancreatin the average retention of nitrogen was greater than without it, though there were individual instances in which this was not the case. Table 6 presents the nitrogen balances of patients who were studied at more than one level of fat or protein intake. With the exception of 1 patient (case 1) who was taking the low protein diet (diet 4), all nitrogen balances were positive. *In general nitrogen retention* was less on the low protein diet (diet 4) than on the other three diets, in which the protein content was relatively high. Our results with regard to nitrogen balances are in agreement with those of Nasset, Pierce and Murlin,[3] who showed that depancreatized dogs may have increased nitrogen retention or normal balances even when large amounts of nitrogen are lost in the feces.

COMMENT.

Among the 10 patients who were studied, there was considerable variation in the degree of impairment of the digestive and absorptive functions of the gastrointestinal tract. Similar variation can be found in the results of previously published intake-excretion studies of patients who have undergone resection of the head of the pancreas.[4] The cause of such variation is not entirely clear, but a good part of it probably represents differences in the amount and quality of the external pancreatic secretion which reaches the gastrointestinal tract. All 3 of our patients in whom the pancreatic ducts were ligated lost large amounts of fat and nitrogen in the feces. There was little difference in the degree of such loss among them. In patients whose pancreas had been anastomosed to the jejunum, on the other hand, the losses ranged from values equal to those of patients whose pancreatic ducts had been ligated to values only slightly above normal. It seems likely that, in some patients, damage to pancreatic tissue had been so extensive as a result of previous obstruction of the pancreatic duct or pancreatitis that little functioning acinar tissue remained. Anastomosis of such a pancreas to the jejunum would not improve digestion or absorption.

Aside from differences in pancreatic secretion, there are other poorly understood factors which influence the absorption of food from the gastrointestinal tract after resection of the head of the pancreas. Partial gastrectomy alone (when the stomach has been anastomosed to the jejunum) was followed by excessive loss of fat and sometimes of nitrogen in the feces.[5] The degree of these losses

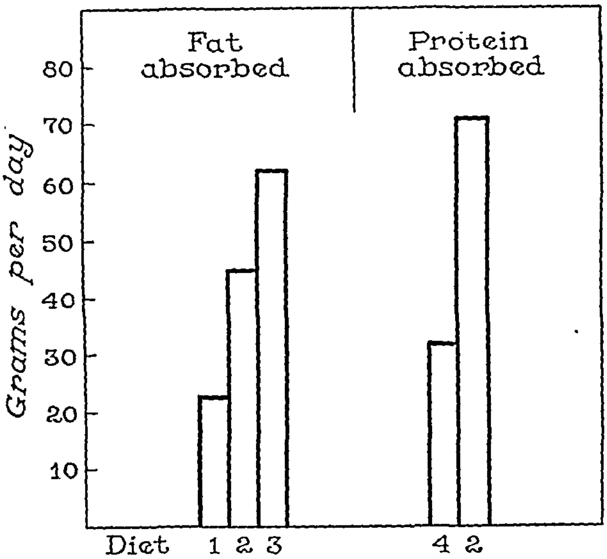

Fig. 6—The effect of various levels of fat and protein intake on the quantity of fat and protein (nitrogen times 6.25) absorbed after resection of the head of the pancreas. The values for fat absorbed are averages for 5 subjects who took both diets 1 and 2 and the value for 1 subject who took diet 3. The values for protein absorbed are averages for 4 subjects who took both diets 2 and 4.

varied from patient to patient but was not of the same order of magnitude as that found when resection of the head of the pancreas and the duodenum had also been done. There was no reason to believe that the pancreas was abnormal in the patients who had undergone partial gastrectomy alone. It seemed unlikely, therefore, that difference in pancreatic secretion was responsible for the variations in fecal fat and nitrogen found. Since partial gastrectomy with gastrojejunostomy was carried out in all patients who underwent resection of the head of the pancreas, this part of the operation alone must have been responsible for some of the excess fecal loss of fat and nitrogen sustained by these patients. By the same token, it could also have been responsible for some of the variation in the losses among them.

Handelsman, Golden and Pratt[6] studied absorption of food by 3 dogs in which special precautions had been taken to exclude pancreatic secretion from the gastrointestinal tract. They found large differences in the amount of food absorbed by different dogs taking the same diet. These differences obviously could not be explained on the basis of variations in pancreatic secretion and were attributed to unknown factors influencing gastrointestinal function. Similar variations were found in the results of Whipple and Bauman,[4a] who studied 4 patients, and Brunschwig and Allen,[4b] who studied 3 patients after resection of the head of the pancreas with occlusion of the pancreatic ducts. Two patients in the first group and 1 in the second group were found to have approximately normal fecal losses of fat and nitrogen. The other patients in the two groups sustained relatively large losses.

In contrast to these findings, all 3 of our patients in whom the pancreatic ducts had been ligated lost large amounts of fat and nitrogen in the feces when they ingested the same test diet. There was little difference in the degree of loss among them. This discrepancy between our results on the one hand and those of Handelsman, Golden and Pratt,[6] Whipple and Bauman,[4a] and Brunschwig and Allen[4b] on the other is not easily explained. Perhaps if we had carried out a greater number of studies with patients whose pancreatic ducts had been ligated, a much greater variation in results would have been found. On the other hand, consideration must be given to the fact that fistulous connections between the pancreas and the gastrointestinal tract of dogs have frequently occurred even after ligation of the pancreatic ducts.[7] Apparently, no such fistulous connections were demonstrated in the animals of Handelsman, Golden and Pratt at the time of necropsy. However, the possibility of formation of fistula was not entirely ruled out in the 2 patients of Whipple and Bauman and the 1 patient of Brunschwig and Allen who were shown to have relatively normal fecal losses of fat and nitrogen. The results of Coffey, Mann and Bollman[8] with dogs indicate that the secretions from only a small amount of pancreatic tissue may be adequate to maintain practically normal digestion and absorption. It is possible that pancreatoenteric fistulas formed in some of our patients whose pancreatic ducts had been ligated. However, the degree of fecal loss of fat and protein in these patients, which was similar to that of patients who had undergone total pancreatectomy,[9] makes it seem improbable that pancreatic juice was entering the gastrointestinal tract.

The study of fecal losses of fat at various levels of fat intake revealed that (1) fecal losses of fat increased as the fat content of the diet increased; (2) in spite of great wastage in the feces the actual amount of fat absorbed was in-

creased by increasing the fat content of the diet, and (3) the efficiency of the gastrointestinal tract decreased as the fat content of the diet was raised. Thus, despite the fact that the actual amount of fat absorbed was larger with the higher fat diets, the average percentage of ingested fat absorbed dropped from 51 per cent with diet 1 to 44 per cent with diet 2 and 30 per cent with diet 3. Similar results were reported by Handelsman, Golden and Pratt with dogs. When patients who have undergone resection of the head of the pancreas are fed diets of high fat content, they often have more frequent and copious bowel movements and experience a greater degree of abdominal discomfort than when their diet is low in fat. Because they have such a poor tolerance for fat and assimilate it so inefficiently, we have usually advised these patients to limit the fat content of their diets to between 50 and 75 Gm. per day.

10	206	143	152	½	0

The results of the study of fecal protein losses at two levels of protein intake revealed that: (1) fecal losses of protein increased as the protein content of the diet increased; (2) in spite of great wastage in the feces, the actual amount of protein absorbed was increased by increasing the protein content of the diet. The results with protein differed from the results with fat in that gastrointestinal efficiency did not diminish as protein intake was increased but on the contrary was somewhat better with the high protein intake than it was with the low. With diet 2 (high protein) an average of approximately 60 per cent of ingested protein was absorbed, while with diet 4 (low protein) approximately 51 per cent of ingested protein was absorbed. Furthermore, the nitrogen balance studies revealed a greater retention of nitrogen with the high protein diet than with the low protein diet. Since large amounts of dietary protein are well tolerated by patients who have undergone resection of the head of the pancreas, we have prescribed for them diets containing from 120 to 140 Gm. of protein per day. Large amounts of carbohydrates are also well tolerated by these patients and can be taken in sufficient quantities to bring the total calories in the diet to 3,000 or more per day.

The beneficial effects of pancreatin on the absorption of fat and protein in human subjects who are suffering from an insufficiency of the external pancreatic secretion seem well established.[10] They are well demonstrated by the fact that fecal losses of fat and protein were reduced by approximately 50 per cent in the four subjects whom we studied.

From a nutritional point of view our 10 patients did surprisingly well, considering the large caloric losses in the feces which some of them sustained. By taking bland diets high in calories, protein and carbohydrate and low in fat, and by taking pancreatin if impairment of gastrointestinal function was great, they were able to gain weight or maintain a satisfactory weight level in almost every instance. In table 7 is presented the customary weight of each patient before illness, the weight at the time of our study and the weight at some later time indicated in the table. Diarrhea was a handicap in only 2 cases (cases 4 and 5). At the present time, two to three years after operation, 7 of the 10 patients are living and 4 of them (cases 2,3,6 and 7) are in good health.

We had the opportunity of repeating intake-excretion studies after the lapse of an interval of time with only 2 of our patients. Patients 7 and 10 were each reexamined with diet 2 a year after their initial studies had been carried out (tables 1 and 2, patient 7, periods 1 and 2 and patient 10, periods 1 and 2). In the case of patient 7 the results in the two periods of study were not entirely comparable, since he had undergone a secondary operation because of obstruction in the biliary tract a month before the second period of study. However, it is of interest to note that fecal losses of total solids and fats were considerably lower at the second examination than they had been a year previously. Fecal loss of nitrogen was not much changed. The results from the two studies of patient 10 showed no great differences.

SUMMARY

By means of intake-excretion studies using standard test diets we have assessed the degree of impairment of the digestive and absorptive functions of the gastrointestinal tract brought about by the surgical procedure necessary for resection of the head of the pancreas. When the pancreatic ducts were ligated at the time of operation, thus preventing the flow of pancreatic juice into the gastrointestinal tract, impairment of gastrointestinal function was invariably great. It was reduced in some patients by anastomosing the remaining portion of the pancreas to the small intestine. It was also reduced when pancreatin was administered.

Although an increase in the dietary fat and protein of these patients resulted in an increased wastage of fat and protein in the feces, it also resulted in an increase in the amount of these foods which was assimilated.

By taking diets high in calories, protein and carbohydrate and low in fat, and by taking pancreatin if impairment of gastrointestinal function was great, most patients who had undergone resection of the head of the pancreas were able to maintain a satisfactory nutritional status.

ABSTRACT OF DISCUSSION

DR. ALLEN O. WHIPPLE, New York: In regard to the contribution by Dr. Wollaeger and associates, I think that this is a great contribution. It settles one thing, the advantage wherever possible of uniting or reuniting the pancreatic flow by anastomosing the pancreatic duct to a portion of the jejunum. That has been a matter of controversy for years, but I think the work done at the Mayo Foundation has settled it, and I am extremely glad to have this paper appear.

DR. ROBERT ELMAN, St. Louis: Because radical resection of the head of the pancreas is not only feasible but successful, the early diagnosis has become more important. May I suggest one method of early diagnosis? Obstruction of the pancreatic duct experimentally produces an elevation in the serum amylase which returns to normal usually in a week or two. One might expect, therefore, that to detect an elevation of the serum amylase after obstruction of the pancreatic duct following carcinoma one should examine the blood rather early in the disease. Otherwise a normal value will be found. I looked up a number of our records of proved carcinoma of the pancreas in which serum amylase was measured and found some correlation in certain cases between elevation of amylase and the duration of symptoms. A patient whose blood was examined the soonest after the onset of symptoms—i.e., four weeks—had the highest value. One case in which the blood was examined at seven weeks had a value of 210. More interesting is the third case, in which, six weeks after the onset of symptoms, the value was 150; this dropped a week later to 100. Without the first determination, the elevation would, of course, have been missed. The fourth case at eight weeks had a value of 150 but three days later had dropped to 210. Doubtless, if the examination had been a week later, the value would have returned to normal. It seems that examinations of the blood early in the course of jaundice would reveal elevations in the blood amylase indicative of obstruction in the pancreatic duct. Another diagnostic procedure which should be mentioned is the exploratory incision. More and more associates and I are subjecting these patients with obscure jaundice to a diagnostic exploration which we feel is just as safe as blind biopsy of the liver and gives much more information than can be observed with the peritoneoscope. Moreover, the information desired may be extended as indicated. First of all, when the ascitic fluid is observed, we are obviously dealing with extensive peritoneal metastasis or a hepatogenous type of jaundice. Second, the liver may be visualized and biopsied. Third, the gallbladder is observed and palpated. If it is greatly dilated, one can be sure of extrahepatic obstruction. This demands examination of the duodenum in order to mobilize it and explore the head of the pancreas. A biopsy for frozen section may then be indicated. The surgeon must be prepared for a negative exploration which may be disappointing from the standpoint of therapy but will be gratefully received by the patient, who may then be sure that he does not have carcinoma

DR. EDWARD BERK, Philadelphia: Current methods of studying the pancreas and its function do not permit the diagnosis of carcinoma to the exclusion of all other lesions. Data in the literature pertaining to clinical manifestations of carcinoma of the pancreas are based largely on persons in whom the cancer was well advanced. These observations have tended to fix in our minds the late manifestations. Furthermore, in many of the reported cases, diagnosis was established solely by the findings at operation. The shortcomings of such unconfirmed surgical observations are obvious, especially when they are used to differentiate the clinical manifestations of cancer confined to the head from those in the body or tail of the pancreas. We must realize that pain and loss of weight, altered carbohydrate metabolism and distributed pancreatic function are important clues. We must appreciate the value of roentgen evidence of changes produced in neighboring viscera. Painless jaundice, palpable enlargement of the gallbladder and bulky, fatty stools, while classical and diagnostically significant, are encountered together in only a minority of the cases of pancreatic cancer

---

An Unsolved Yellow Fever Problem.—The mode of passage of jungle yellow fever over open country between forests remains one of the unsolved problems in the study of this disease. It is known that monkeys and certain other vertebrates may contract yellow fever by the bite of infected sylvan mosquitoes and harbor the virus for a period of days. Thus the virus may survive and spread in any given forest patch until the susceptible animal population is immunized, or until the insect vectors decrease to such small numbers, due to unfavorable conditions, that they can no longer maintain the cycle. The local migration of monkeys and mosquitoes within their normal habitat logically accounts for infiltration within the forest, but the method by which the virus traverses the open country between isolated forest patches, such as exist in the path of epidemic yellow fever in central and southern Brazil, has not been satisfactorily explained.—Causey, O. R., and Kumm, Henry W., *The American Journal of Tropical Medicine*, May 1948.

ROENTGENOLOGIC TREATMENT OF LYMPH NODES AND SPLEEN IN BRILL-SYMMERS DISEASE

SIDNEY RUBENFELD, M. D.
New York

There is a comparatively newly described disease which is known as giant follicular lymphadenopathy or Brill-Symmers disease.[1] It has been widely recognized by pathologists but is only beginning to attract the attention of clinicians, among whom it is almost always mistaken for Hodgkin's disease. Both are primarily diseases of the lymphoid system and both are characterized, clinically, by generalized, occasionally by localized, enlargement of the superficial lymph nodes and not uncommonly by splenomegaly. Histologically, the changes in the lymph nodes and the spleen are so divergent that confusion between the two diseases is scarcely possible. It is imperative for the radiologist, to whom falls the duty of treating these patients, to know the underlying morphology and the responses to radiation.

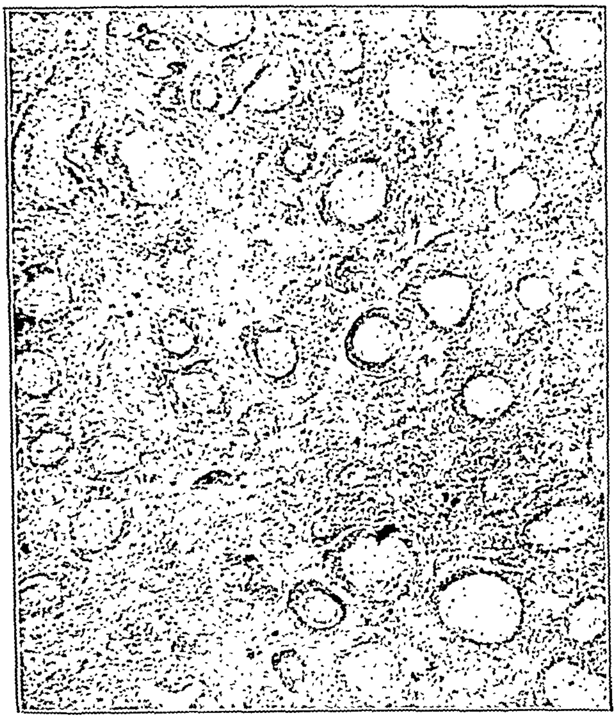

Fig. 1.—Low power photomicrograph showing numerical and dimensional hyperplasia of the lymph follicles in giant follicular lymphadenopathy.

PATHOLOGY

Giant follicular lymphadenopathy is characterized by numerical and dimensional hyperplasia of the lymph follicles (fig. 1). The follicles may consist exclusively of small lymphocytes (fig. 2). More commonly three types of cells are distinguishable in them: large cells with hypochromatic nuclei whose borders are sharply defined and indented; slightly smaller cells with richly chromatic nuclei but with similarly indented limiting membranes; and cells with still smaller, deeply staining nuclei with poorly defined limit-

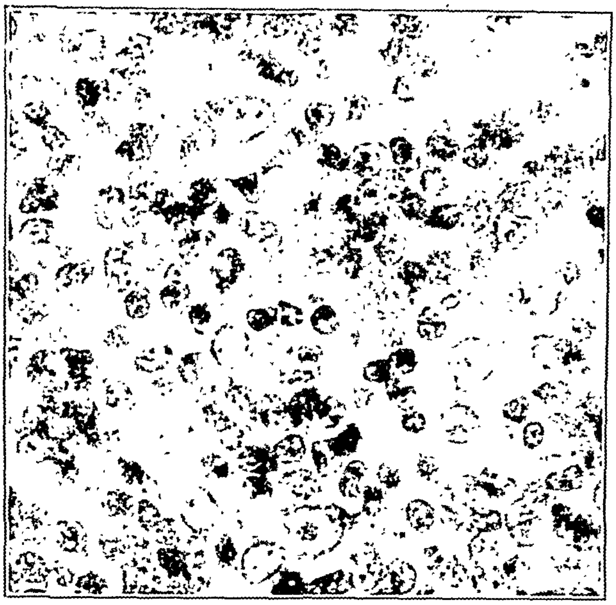

Fig. 2.—A high power photomicrograph depicting three distinguishable types of cells: the large cells with hypochromatic nuclei whose borders are sharply defined and indented (shadow cell); slightly smaller cells, deeper staining and with similarly indented nuclei, and, thirdly, smaller richly chromatic cells which are in the order of large lymphocytes.

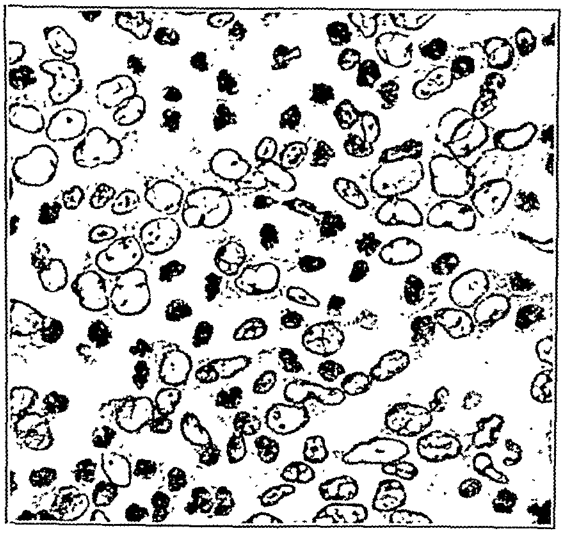

Fig. 3.—Drawing to illustrate the cells photographed in figure 2.

Read before the Section on Radiology at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 13, 1947.

From the Department of Radiation Therapy, Bellevue Hospital, New York, Dr. Ira I. Kaplan, Director. Dr. Rubenfeld is visiting radiation therapist, Bellevue Hospital; and associate clinical professor of radiology, New York University College of Medicine.

[1] Brill, N. E.; Baehr, G., and Rosenthal, N.: Generelized Giant Lymph Follicle Hyperplasia of Lymph Nodes and Spleen, J. A. M. A. 84: 668 (Feb. 28) 1925. Symmers, D.: Giant Follicular Lymphadenopathy With or Without Splenomegaly, Arch. Path, 26:1092 (Sept.) 1938; Clinical Significance of the Pathologic Changes in Giant Folicular Lymphadenopathy, ibid. 34: 385 (Aug.) 1942; Clinical Significance of the Deeper Anatomic Changes in Lymphoid Diseases, Arch. ing membranes that are of the type of large lymphocytes (figs. 3 and 4). The hyperplastic lymph follicles may remain intact throughout the course of the disease or they may rupture and permit the escape of their cell components into the substance of the nodes (figs. 5, 6 and 7). In the latter event the disease giant follicular lymphadenopathy becomes transformed into polymorphous cell sarcoma. Symmers described this transformation in 1938. According to Cohen and Bergstrom,[2] "The ability of this disease to alter its morphology appears to be fundamental. Giant follicular lymphadenopathy is to be understood as a pattern of hyperplasia with potentialities for multiple differentiation, the end phase being unrecognizable in the original morphology." On the other hand, it may remain unchanged throughout life (Symmers; Cohen and Bergstrom); it may undergo transformation into lymphosarcoma (Baehr, Klemperer and Rosenthal[3]), or it may terminate in lymphoid leukemia or become associated with the histologic changes of Hodgkin's disease (Symmers). It may give rise to a reticulum cell sarcoma (Cohen and Bergstrom), or, finally, it may undergo transformation into the polymorphous cell sarcoma of Symmers. These paths of development are represented in the following manner:

Giant Follicular Lymphadenopathy

– Associated with features
of Hodgkin's disease

Lymphatic leukemia Lymphosarcoma Reticulum cell sarcoma Polymorphous cell sarcoma

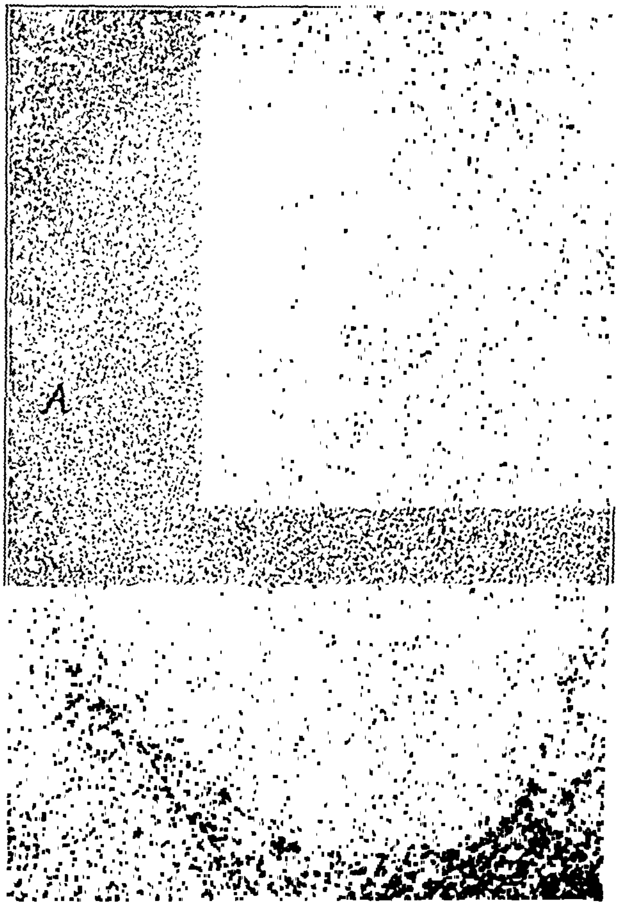

Fig. 4.—A large ballooned lymph follicle composed of cells indentified in figures 2 and 3. At point A the rim of lymphocytes shows thinning and initial rupture as a precursor of polymorphous cell sarcoma.

CLINICAL FEATURES

Nineteen patients with giant follicular lymphadenopathy or with polymorphous cell sarcoma have been studied. The oldest patient was 59, the youngest 12. The ages in decades were as follows: 1 to 10 years, no cases; 11 to 20 years, 2 cases; 21 to 30 years, 3 cases; 31 to 40 years, 4 cases; 41 to 50 years, 8 cases, and 51 to 60 years, 2 cases. There were 5 females and 14 males.

Enlarged lymph nodes constituted the outstanding clinical feature. Clinically, the nodes appeared as localized enlargements of peripheral groups. In order of frequency, the enlarged lymph nodes were as follows: axillary lymph nodes, 13 patients; cervical lymph nodes, 13 patients; inguinal lymph nodes, 11 patients; occipital lymph nodes, 3 patients; epitrochlear lymph nodes, 2 patients; femoral lymph nodes, 1 patient, and auricular lymph nodes, 1 patient.

The size of the nodes varied from 1 to 3 cm. Neither in size, consistency nor attachments did the nodes present identifying characteristics, a feature which should be emphasized, since clinically they are indistinguishable from those of other lymphomas, notably Hodgkin's disease.

In addition to the presence of enlarged lymph nodes other features were noted as follows: weakness, 5 patients; cutaneous lesions, 4 patients (exfoliative dermatitis); loss of weight, 4 patients; cough, 3 patients; abdominal pains, 2 patients; edema of legs, 1 patient; pallor, 1 patient; burning of feet, 1 patient, and dyspnea, 1 patient. Enlargement of the spleen was present in 3 patients, and 1 had an enlarged liver.

Of interest was the appearance of persistent leukopenia in 4 patients. One patient who has been observed for fourteen years showed a white cell count of 2,000 for over two years.

TREATMENT

Nine patients with giant follicular lymphadenopathy and 10 with polymorphous cell sarcoma have been treated.

The lymph nodes and spleen were treated with roentgen rays of a half value layer of 1 to 2 mm. of copper at a distance of 50 cm. in unit doses that varied between 100 and 200 r (in air). The size of the portal was adapted to cover the area of involvement and varied between 50 and 225 sq. cm. A total air dose of 600 to 1,000 r caused recession of the enlarged lymph nodes and spleen in giant follicular lymphadenopathy. Lymph nodes that had undergone transformation into polymorphous cell sarcoma usually required higher doses, to the extent of 2,000 to 3,000 r. In addition to the difference in the degree of response there were variations in the rapidity of recession. Whereas the lymph nodes of giant follicular lymphadenopathy showed rapid decrease or even disappeared, those of polymorphous cell sarcoma were slow to regress and even showed a latent period of two to six months before disappearing. In 1 patient the lymph nodes showed histologic evidence of giant follicular lymphadenopathy, but other nodes in the same patient required 3,000 r before improvement was noted, and it is assumed that some form of mutation had occurred. These variations in response to radiation therapy support the view that giant follicular lymphadenopathy is a relatively benign disease and that polymorphous cell sarcoma is a resistant or malignant phase.

REPORT OF CASES

Giant Follicular Lymphadenopathy.—J. H., aged 49, was first seen in October 1933 because of loss of weight and a burning sensation in both feet. The spleen was enlarged to a point 15 cm. below the left costal margin. Enlarged lymph nodes were palpated in the axillary, inguinal and epitrochlear regions. The nodes were firm, nontender and freely movable and varied in size from 1 to 2 cm. The liver was palpated 2 cm. below the margin of the ribs. The white cells numbered 4,200, of which 55 per cent were lymphocytes. Histologic examination of several lymph nodes removed from the left axilla showed numerical and dimensional hyperplasia of the follicles. Treatment was given according to the technic just outlined. The spleen was treated anteriorly and posteriorly every third day alternately until a dose of 300 r was delivered to each side. Two months after completion of treatment the spleen and liver had receded and the lymph nodes were no longer palpable. Further improvement was indicated by the disappearance of the burning sensation in the feet, by return of the normal blood count and by a gain of 25 pounds (11.3 Kg.) in weight. In 1946 the patient was still well and was following his occupation as a tile setter. Blood chemistry studies, sternal marrow examinations and roentgenograms of the long bones were all within the limits of normal. The blood count showed 1,400 leukocytes, of which 65 per cent were lymphocytes. The spleen was palpated 4 cm. below the left costal margin. The blood count has since been repeated on numerous occasions and showed persistent leukopenia. In this case the presence of a relatively high lymphocyte count suggests the possibility of transformation of giant follicular lymphadenopathy into lymphoid leukemia.

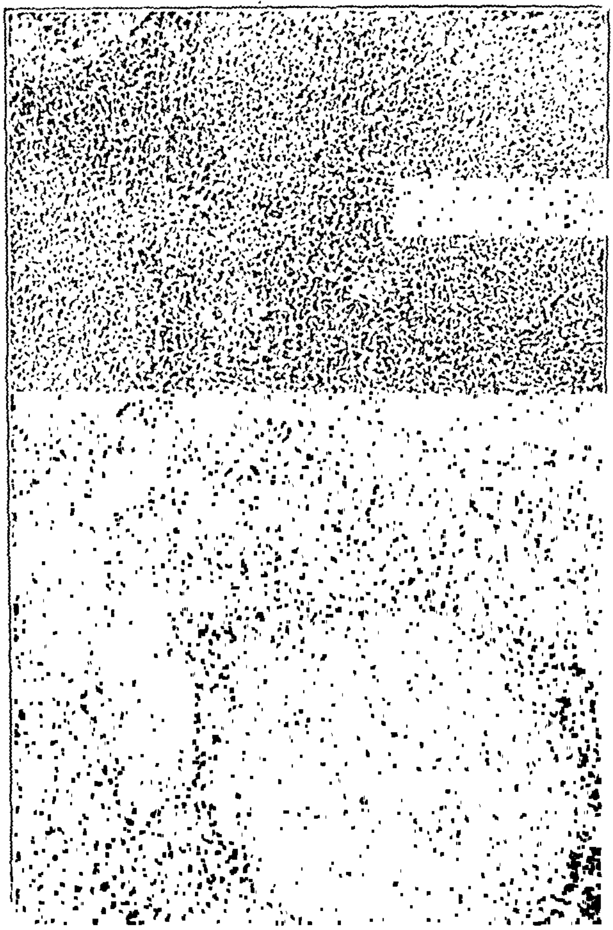

Fig. 6.—Showing varying-sized lymph follicles some of which have grown to large size. Some have ruptured, pouring their contents into the stroma of the node, and others have coalesced with neighboring follicles.

Polymorphous Cell Sarcoma.—F. L., aged 12, presented enlarged lymph nodes in the cervical, axillary, inguinal and epitrochlear regions. The spleen was not palpable. The blood count was normal. Histologic examination of an excised cervical node revealed the changes of polymorphous cell sarcoma. In July and August of 1938 each lymph node region was irradiated until a dose of 700 r (air) was delivered. There was no detectable recession. Treatment was continued until November so that, over a period of four months, each area received 2,200 r (air). At the end of that time no enlarged lymph nodes were apparent. At the present moment, or eight years after the commencement of radiation therapy, the patient is well.

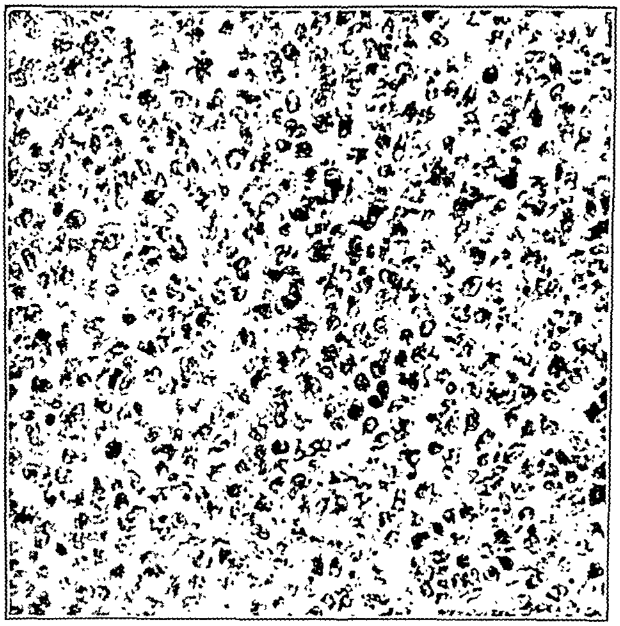

Fig. 7.—High power photomicrograph from a ruptured follicle showing infiltration of the body of the node by large hypochromatic or shadow cells and smaller hyperchromatic cells of the large lymphocyte type.

RESULTS OF TREATMENT

Survival data of this group of patients are summarized in tables 1 and 2.

TABLE 1.—*Patients with Giant Follicular Lymphadenopathy*

Patient	Years of Survival	Notes
J.H.	14	Still under observation
D.W.	10	
W.W.	7	
C.R.	4	Not followed
B.W.	3	Still under observation
D.K.	5	Died in acute toxemia
C.D.	No follow-up	
J.J.	No follow-up	
I.R.	No follow-up	

Four of 7 patients (66 per cent) with giant follicular lymphadenopathy and 6 of 10 (60 per cent) with polymorphous cell sarcoma are known to have survived five or more years. These figures stand in sharp distinction to the relatively less favorable survival rates of lymphosarcoma, 25 per cent; Hodgkin's disease, 20 per cent, and lymphatic leukemia, 15 per cent. The immediate and often dramatic recession of the enlarged lymph nodes in giant follicular lymphadenopathy may be used as an index to distinguish these nodes from those of polymorphous cell sarcoma, the behavior of which is commonly characterized by a slower rate of recession after larger total doses of radiation.

SUMMARY AND CONCLUSIONS

The lymph nodes in giant follicular lymphadenopathy are characterized, histologically, by increase in the number and size of the lymph follicles. When the follicles rupture and their cells escape into the substance of the node, the disease assumes the malignant qualities of polymorphous cell sarcoma. Giant follicular lymphadenopathy may undergo transformation into polymorphous cell sarcoma, into lymphosarcoma, into Hodgkin's disease or into lymphoid leukemia.

The character of the nodes or the symptoms were not different from what appears in other diseases of the lymph nodes. The single noteworthy exception was the persistent leukopenia.

Roentgen therapy of 200 kilovolt potential was used to treat the lymph nodes and spleen. Two noteworthy variations in response were noted: The nodes in giant follicular lymphadenopathy receded or disappeared under doses of 800 to 1,000 r, while the nodes in polymorphous cell sarcoma regressed only after doses of 2,000 to 3,000 r. The nodes in polymorphous cell sarcoma frequently showed a latent period of reaction in contrast to the rapid disappearance of the nodes in giant follicular lymphadenopathy. These variations may be used as a therapeutic test.

Sixty-six per cent of patients with giant follicular lymphadenopathy and 60 per cent of those with polymorphous cell sarcoma are apparently well five or more years after the institution of treatment.

ABSTRACT OF DISCUSSION

DR. SAMUEL E. COHEN, Elmira, N. Y.: It is encouraging to learn that of Dr. Rubenfeld's patients treated for giant follicle lymphadenopathy and for polymorphous cell sarcoma 66 and 60 per cent respectively are well five or more years after start of radiotherapy. Heretofore, five year survival rates were quoted at 47 to 50 per cent. A second important point which Dr. Rubenfeld makes is the difference in the response between giant follicle lymphadenopathy and the polymorphous cell sarcoma derivative. His follicular lymphomas receded quickly and required moderate radiation, while the sarcomatous variety of Symmers regressed only after intense treatment and showed a lag period before response. These dual features, the general radiosensitivity of the disease and the differences in response of the two allied conditions, have a common pathoanatomic background. I wish to direct your attention to this component. Brill-Symmers disease is a composite entity consisting of various phases and multiple morphologic manifestations. The anatomic forms which this disease can assume are now seven in number. The disease has all the potentialities of a malignant condition, but the degree of malignancy, both pathologic and clinical, varies in the different subdivisions. Giant follicle lymphadenopathy has a relatively better prognosis than other forms in the category. This disease develops and progresses slowly, its response to irradiation is gratifying. This comparatively favorable course of giant follicle lymphadenopathy is determined by its morphology. In its earliest form the disease begins as a lymph node hyperplasia histologically resembling the inflammatory-toxic type. Basically the disease is characterized by a morphologic pattern that is a differentiated form of structural arrangement. It is this degree of differentiation that determines the development, the radiosensitivity and the outcome. In its early phases the disease is reversible or curable. When it has become transformed into a dedifferentiated structural modification the course is irreversible and the outcome is fatal. The development and prognoses of giant follicle lymphadenopathy are attributes of its morphologic differentiation. The prognosis deteriorates as the pattern of differentiation originally inherent in the disease disintegrates. Radiosensitivity does not always indicate curability. While the disease responds in the beginning, it progressively becomes radioresistant. Of those patients surviving five years, about one half to two thirds will not reach the ten year mark, and the impression exists that even ten years is not a sufficient length of time to be sure that a malignant lymphoma may not reappear. Although usually highly responsive to radiotherapy, the disease most frequently slowly progresses, takes the full course of a malignant neoplasm and in the experience of many is invariably fatal under those present methods of treatment as are routinely available. But life can be maintained and in ever increasing survival rates as conclusively illustrated in the cases presented by Dr. Rubenfeld.

Eosinophilic Granuloma of Bone.—During the past seven years eosinophilic granuloma of bone has rapidly assumed increasing importance as a specific clinical entity. This particular destructive lesion mimics a variety of neoplastic processes as well as inflammatory conditions, and should be considered in any differential diagnosis in which single or multiple lesions of bone are encountered. Solitary eosinophilic granulomata may stimulate bone cyst, giant cell tumor, Ewing's tumor, solitary myeloma, osteogenic sarcoma, and osteomyelitis. Multiple lesions may present the same clinical signs and roentgenographic findings as multiple myeloma, metastatic tumor, osteitis fibrosa cystica, Letterer-Siwe disease, and Hand-Schuller-Christian disease.—Maurer, Elmer, M.D., and DeStefano, M.D., *The Journal of Thoracic Surgery*, June 1948.

THE UNITED STATES ARMY AND THE HISTÒRY OF MEDICINE

HAROLD WELLINGTON JONES, M.D.
Washington, D. C.

Just where should one begin? Obviously at the very beginning of the United States Army. For practical purposes, one should start with the year 1775, for it was then that the history of the Medical Department, or as it was once called, the Hospital Department, first came into being. The Army was at Cambridge following the battle of Lexington, and, from that day to the present, many of its medical officers have made history over a period of one hundred and seventy-two years.

It is by no means easy to make even a fair evaluation of the work of the many persons contributing to the results achieved in nearly a century and three quarters. In our examination, we physicians are confronted with the problems of the dim past and the recent past, with the living and with the dead, with the meager accounts of difficult and laborious tasks of long ago and with the well publicized and skilfully presented stories of the present day. Comparisons are often useless and we should not attempt them. The work of those long dead we can often best appreciate because it has been weighed carefully, and, after a lapse of many years, sober judgment can be rendered.

As a basic principle, we should take it for granted that in the compilation of any history an unbiased writer will not lean toward inclusion of those whose contributions are ephemeral and without lasting influence on the progress of medicine. Also we should remember that the work and influence of a person temporarily on duty with the Army Medical Department should not be credited wholly to the Army organization, but only that part which is inherent to and dependent on Army service, facilities and opportunities.

It is not easy to appraise justly the great medical figures in this recent war, and no one can predict with certainty who will be remembered in the annals of its medical history. It is difficult to achieve immortality even with the best of intentions. Some will have greatness thrust on them, while others will achieve it, not alone, but by a generous willingness to welcome the inclusion of many who held humble office but who well deserve to share the glory.

THE AMERICAN REVOLUTION

The American Revolution was a sterile one as far as medical literature is concerned, and of the some 1,400 physicians who took part in it, but 3 or 4 wrote anything of importance. James

---

Read before the Section on Miscellaneous Topics at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J. June 11, 1947.

Thacher[1] kept a journal of the period from 1775 to 1783, and our knowledge of the day to day happenings of the Medical Department is largely due to him.

It is my belief that John Morgan of Pennsylvania, born in 1735 and a noted pupil of John Hunter, was the greatest medical leader of the Revolutionary War. To him we owe our first hospital regulations, and one cannot read them or his correspondence with Washington unaware of his commanding stature. Possessing an admirable character, he was persevering, unselfish and indefatigable. Despite the controversial phase of his administration his achievements should live in the history of American medicine.

THE PERIOD IMMEDIATELY FOLLOWING THE REVOLUTION

In the period immediately following the revolution there is practically nothing to record concerning medicomilitary operations or discoveries on the part of our medical officers, and there is little to interest the historian. Not until 1818, with the appointment of Joseph Lovell as Surgeon General, did the Medical Department have anything to be proud of. Young Dr. Lovell was a friend of Andrew Jackson; his home, the famour Blair House, was close to the White House. Lovell is responsible for the best set of sanitary regulations the Army had ever had up to this time. He also founded the Army Medical Library.

The same era produced William Beaumont, who was born in 1785, entering the Army in 1812. His early record shows thar he possessed an inflexible and uncompromising character. In 1822 came his great opportunity, when he was called to care for Alexis St. Martin, who had been severely injured by a charge of duck shot which carried away the anterior half of the sixth rib, lacerated the lung and diaphragm and perforated the stomach, leaving a permanent gastric fistula. Beaumont's place in history is secure as a result of his unparalleled opportunities for observation. Following the publication of his "Physiology of Digestion or Experiments on the Gastric Juice,"[2] his name became known in the far corners of the earth. Beaumont's contributions to our knowlege of digestion are acknowledged generally as the greatest in this field up to the time of Pavlov, late in the nineteenth century. While his military superiors were not unaware of the fame accruing to the Medical Department of the Army as a result of Beaumont's studies, there seems to have been a lack of official enthusiasm for his continuance in research, and he resigned from the Army in 1839.

THE CIVIL WAR

In the War between the States shone two brilliant luminaries, William A. Hammond and Jonathan Letterman. Hammond, in his thirties, was appointed Surgeon General in 1861 over the heads of so many of his superiors that it is useless to count them. Almost at once he secured authority to place all the general hospitals under the command of The Surgeon General, and they have remained there ever since. He collected a host of medical statistics of the war, and this procedure has never ceased. He is responsible also for the remarkable collection of pathologic specimens of the Civil War. These were ordered placed in Washington, and that was the beginning of the Army Medical Museum. He inaugurated the Army monthly sanitary reports, an important feature in the history of preventive medicine. Almost everything Hammond began he saw to a conclusion, and most of his important work continues in effect. Strange to say, his reward for these meritorious reforms and innovations was dismissal from the Army by sentence of a General Court Martial. Long after the war, the Congress corrected this monstrous injustice and restored him to his place of honor. By that time, all Hammond cared for was his good name. He wanted no more of military life. His success as a neurologist in his later years has no connection with the Army, but is cited merely to emphasize his extraordinary versatility.

In a position contemporaneous with Hammond is Jonathan Letterman, once the forgotten man of the United States Army Medical Department. Surgeon Letterman revolutionized the transportation of the wounded from the battlefield, for not since the time of Larrey, Napoleon's chief medical officer, had any great advance been made. Letterman's ambulance service during the latter half of the Civil War has made history, and his example in the present century has never been lost sight of. Our present system of evacuating the wounded, now reaching a stage of perfection once undreamed of, dates back to Letterman's conception and solution of a problem which had ever been the despair of Army medical officers.

The War of the Rebellion produced other great names, some of them of men who, through their surgical experience, rose to dizzy heights in the profession and influenced greatly the history of medicine, but they are not to be claimed by the Army. "The Medical and Surgical History of the War,"[3] compiled by Otis, Smart, Woodward and Huntington, was a mighty and enduring contribution. Since that day, our Medical Department has never failed to record for posterity the medical history of our armed conflicts.

THE CLOSE OF THE NINETEENTH CENTURY

With the end of the Civil War came still another period of sterility, and I am able to include, up to the closing years of the century, but two instances in which the Medical

[2] Beaumont, W.: The Physiology of Digestion with Experiments on the Gastric Juice, Burlington, C. Goodrich, 1847.

[3] Otis, G. A.; Smart, C.; Woodward, J. J., and Huntington, D. L.: The Medical and Surgical History of the War of the Rebellion, United States War Department, Surgeon-General's Office, 1870-1879.

Department of the Army secured any preeminence in professional fields, to influence in any considerable degree the march of medical science. In the domain of bacteriology, George M. Sternberg was gospel for a time. He had the distinction, independently of Pasteur, of discovering the Pneumococcus. Sternberg is not well remembered today, but his claim to a place in the company of the elect seems to rest on a sound basis. The other name, that of John S. Billings, has a unique significance. Billings was the immortal originator of the Index Catalogue, and never did bibliographer become so famous over night. Billings has other claims to distinction in that he was the founder of the greatness of the Army Medical Library, the planner of the Johns Hopkins Hospital and the lever that helped to raise the United States Public Health Service to its present proud position. Add to this the fact that he consolidated three great New York libraries into one public library system before he died, and you cannot resist him even if you do not remember him. Seldom has a man labored so diligently and left so much to live after him.

In a day long past, the Medical Department of the army produced a number of excellent naturalists and ornithologists. Albert J. Myer, for whom Fort Myer was named, began his Army service as a medical officer, and later became Chief Signal Officer. He founded the meteorologic service of the United States. Frederick C. Ainsworth also began as a medical officer, but becoming impatient of delay incident to obtaining data necessary for pension applications, founded the Record and Pension Office, the forerunner of the Veterans Administration of today. Leonard Wood made history as a combat officer, rising to be Chief of Staff and later Governor General of the Philippines. He exercised a not inconsiderable influence in stamping out mosquito-borne diseases in Cuba. In later years, his administration in the Philippines aided greatly the development of the modern humane treatment of leprosy.

To sum up, one may say, if I may be excused for the repetition, that in strictly medical endeavors in the closing years of the last century, one calls to mind only Billings and Sternberg as deserving of a large place in medical history. This is not to deny credit to the many who made worth while endeavors connected with opening a new land west of the Mississippi. In general, one can say, therefore, that the United States Army made little important medical history up to the beginning of the twentieth century, and its main achievements in this field were almost entirely those of men who worked alone, often with little or no recognition or Government encouragement.

Just before the beginning of the present century, Walter Reed, fired no doubt by Sternberg's work, entered the field of preventive medicine with his epoch-making discovery of the mode of transmission of yellow fever. Major Reed was assisted by James Carroll and Jesse Lazear, whose names are linked with his to the glory of the United States Army. It would be difficult to estimate the saving in human life and treasure which has resulted from the work of the Yellow Fever Board.

THE TWENTIETH CENTURY

We should recall that the work on yellow fever was one of the first pieces of scientific research for a definite and announced purpose in which the War Department was actively interested. Within a few years, William Crawford Gorgas likewise had made his name immortal by his sanitary work in the Panama Canal Zone. This followed directly on Reed's discovery, and the organized sanitary campaign waged by General Gorgas, often with insufficient financial support, was one of the greatest in history. It was responsible for much of the success in zone sanitation and mosquito-borne disease prevention achieved by the Army in succeeding years.

Some years before the outbreak of the First World War, Frederick F. Russell began his great task on the elimination of typhoid from the Army by the use of prophylactic vaccine, following the lines suggested by Sir A.E. Wright. The result of Russell's work has been astounding, and typhoid has long ceased to exist in our Army. These results led to many other prophylactic measures, notably the compulsory protection of American forces from tetanus.

Bailey K. Ashford's labors in the elimination in great part of ancylostomiasis, or hookworm disease, in Puerto Rico should be referred to. It has not been given the wide attention it deserves, and Ashford should be regarded as one of the great benefactors of the Western World.

In the field of pulmonary tuberculosis, beginning with the establishment of Fort Bayard as a tuberculosis hospital, the Army contributed much of value in the last third of a century. For this, George E. Bushnell was in great measure responsible. Despite his comparative anonymity, I look on Bushnell as a far-sighted genius, well worthy of grateful remembrance.

The fact that drinking water can be quickly and cheaply sterilized in the field by means of sodium hypochlorite was demonstrated by an unassuming medical officer who never wrote for publicity. Carl R. Darnall is to be credited with this epochal discovery, which lighted the way to the modern treatment of municipal water supplies by chlorine. William J. Lyster, by his invention of the field sterlizing bag, aided the practical application of Darnall's discovery to army field service.

In the early years of the twentieth century, research in tropical medicine in the Army went on apace. Charles F. Craig in parasitology, Edward B. Vedder in beriberi, Henry J. Nichols in yaws and Raymond Kelser in the control of rinderpest in the Philippines made important contributions not to be lost sight of. I mention Fielding H. Garrison and would like to claim him for the Army for his great contributions to the history of medicine. However, he was a civil service employee of the War Department until late in life. Only when his work was done did he receive a commission in the Army, and his services subsequently were not outstanding. As a historian on the strictly military side one should not forget Louis C. Duncan, whose analysis of the battles of the Civil War are of a high order.

During the First World War, the work of individuals was subordinated largely to team work for the greater benefit of the whole Army. Harvey Cushing's brilliance in head surgery, as a notable exception, can be credited, in part, to the Medical Department with which he was then connected. Most of our medical officers did their work as sanitarians, administrators and executives, receiving little in the way of personal prestige, for that was reserved for the great captains and kings. General Merritte W. Ireland's splendid organizing ability, however, was such that it brought him appreciation and distinction that will be long remembered. His influence has made itself felt for more than a generation.

SUMMARY

To summarize the scientific and practical work of the Medical Department of the Army in the century and a half since the Revolution and ending in the period some years after the close of the First World War, I think one can say that the elimination of yellow fever and typhoid and the sanitary clean-up in the Canal Zone are certainly among the great medical accomplishments of all time. The discovery of the means of sterilizing water supplies by chlorine, the elimination of ancylostomiasis in a great portion of Puerto Rico and the successes in the institutional treatment of tuberculosis are certainly notable achievements. It cannot be claimed for the Army that many important medical or surgical discoveries have been made in the strictly clinical fields, but I should like to mention the surgical contributions of William L. Keller in handling fracture in the field and in the surgery of empyema. Our late Surgeon General, Norman T. Kirk, has made many valued contributions to the study of amputations, on which no man is better qualified to speak.

It may be remarked that it is not the particular work of individuals that has reduced the noneffective and mortality rates in the Army, but rather the systematic use of preventive measures of demonstrated soundness in their application to large masses of men living under the same conditions and also under complete and orderly control, that has brought about satisfactory end results. Even here one cannot lose sight of the individual, for the history of medicine is concerned largely with personalities. Therefore, in closing, I take the liberty of listing chronologically the twelve greatest medical names of the Army, accompanied by their triumphs, who I feel deserve a place in medical history during the century and a half following the American Revolution.

1. The researches of William Beaumont in human digestion

2. The vision of William A. Hammond and his contributions to the study of pathology

3. The organizational scheme of evacuating wounded from the battlefield, perfected by Jonathan Letterman

4. The bibliographic research and the founding of of the Index-Catalogue of medicine, by John S. Billings

5. The discovery of the mode of transmission of yellow fever, by Walter Reed

6. The contributions to the study of bacteriology, by George M. Sternberg

7. The practical sanitary measures instituted by William C. Gorgas, resulting in the elimination of mosquito-borne disease in the Panama Canal Zone

8. The United States Army's record in the care and treatment of pulmonary tuberculosis, which received its impetus from the early work and enthusiasm of George E. Bushnell

9. The introduction of vaccination against typhoid in the United States Army, by Frederick F. Russell, leading the way to important later work in immunology

10. The discovery of a means for the practical sterilization of water by means of chlorine, by Carl R. Darnall

11. The elimination of ancylostomiasis, or hookworm, from large areas at Puerto Rico, by Bailey K. Ashford

12. The coordination of medical elements in the European Theater of Operations in World War I, by Merritte W. Ireland

Here I close this brief summary of accomplishment by the United States Army Medical Department, hoping that I have made a just appraisal of the results, which I am confident will live in the annals of historical medicine, leaving the important work of the war which has just ended to those who will one day follow me.

Clinical Notes, Suggestions and New Instruments

LYMPHOCYTIC CHORIOMENINGITIS

Report of a Case Occurring in a Granary Harboring Infected Mice

W. PAUL HAVENS JR., M. D.
Philadelphia

The occurrence of lymphocytic choriomeningitis in persons from homes where mice have been proved to be carriers of the virus is well known[1] A few cases have occurred in closely circumscribed areas Farmer and Janeway[2] recorded 4 cases in persons living within an area of two blocks in Boston Dalldorf and associates[3] reported 3 cases, occurring over a period of two years, in persons living in or adjacent to one apartment building where infected mice were found It has been suggested that small, persistent foci of infection exist, on the basis of the known natural history of the disease in mice and the circumscribed range of activity of mice The percentage of infected house mice varies apparently in different communities, and it has been recorded as 21 5 per cent in Washington, D C,[4] and 4 per cent in Boston[5] and New York[6]

The diagnosis of lymphocytic choriomeningitis is usually not suspected unless attention is directed to signs and symptoms suggestive of meningoencephalitis, although it has been shown that generalized systemic infection may occur without any evidence of involvement of the central nervous system[7] It is not known how often the disease manifests itself in this form, nor is it known how often apparently asymptomatic infection occurs. The demonstration of neutralizing antibodies in the blood of as many as 10 per cent of the adult population, chosen at random, suggests that they may occur more frequently than is suspected[8] However, in spite of the diagnostic methods now available, less than 100 proved cases of this disease have been recorded up to the present time Many of these represent infections acquired during experimental work with the virus, so that the number of proved naturally occurring cases is still small

It is the purpose of this paper to report the isolation of lymphocytic choriomeningitis virus from a patient with the disease and from mice trapped in a granary where he worked The results of a survey to determine the possibility of infection in 6 other persons who worked in the same granary are also recorded

REPORT OF CASE

J. H., aged 15, was admitted to the Pennsylvania Hospital on Dec. 27, 1946, complaining of headache and stiff neck Three days before admission, he had frontal headache, chilliness and sore throat. He was nauseated and vomited once During the next two days he was aware of stiffness of the neck and photophobia Physical examination revealed a well developed and nourished white boy who appeared acutely sick and lethargic The rectal temperature was 102.8 F. (39.3 C), the pulse rate 80 and the respiration rate 22 The face was flushed, the upper eyelids were edematous and the conjunctivas were congested Photophobia was present, and there was tenderness to pressure and pain on motion of the eyeballs Flattening of the right nasolabial fold was present The ocular fundi were normal except for slight blurring of the margins of the optic disks There was tenderness over the posterior muscles of the neck, and mild nuchal rigidity was present Moderately enlarged and tender anterior and posterior cervical lymph nodes were palpable, and the pharyngeal mucosa was congested The heart and lungs were normal and the liver and spleen were not palpable The deep tendon reflexes were equal but hypoactive The Kernig sign was present bilaterally The Babinski sign was not present

Laboratory Data—On the day of admission, the hemoglobin measured 15 Gm per hundred cubic centimeters and the erythrocytes numbered 5,400,000 and the leukocytes numbered 7,000 cells per cubic millimeter, with 44 per cent polymorphonuclear leukocytes, 48 per cent lymphocytes and 8 per cent monocytes The urine was clear, yellow, acid, with a specific gravity of 1 028. There was no albumin or sugar, and the stained urinary sediment was normal Boerner-Lukens and Eagle flocculation tests of the blood gave negative results Culture of the blood was sterile Lumbar puncture revealed faintly cloudy spinal fluid with an initial pressure of 350 mm of water, containing 800 cells per cubic millimeter, of which 70 per cent were lymphocytes Stained smear of the centrifuged sediment revealed no bacteria, and culture was sterile

Course of Disease.—During the ensuing five days, the temperature declined slowly by lysis, reaching normal on the seventh day of disease Headache, lethargy, photophobia and lymphadenopathy continued unabated for the first two days of hospitalization and thereafter diminished so that by the eighth day of disease the patient was asymptomatic Convalescence was uneventful and recovery was complete.

On the fifth day of disease, the leukocytes numbered 10,000 cells per cubic millimeter, with 87 per cent large lymphocytes. Both relative and absolute lymphocytosis persisted for the ensuing week Heterophile antibody agglutination tests on the patient's serum gave negative results on the sixth and the twenty-fourth day of disease.

Isolation of Virus—Lymphocytic choriomeningitis virus was isolated in white mice and guinea pigs from both spinal fluid and blood obtained from the patient on the fourth day of disease This strain of virus was serologically indistinguishable from the W E[9] strain of lymphocytic choriomeningitis virus.[10]

Two weeks after the onset of illness, 3 gray mice were trapped in the granary where the patient had worked A strain of virus, indistinguishable immunologically from the strain of virus obtained from the patient and from the W E strain of virus, was isolated from the pooled brains of these mice.

Identification of the strains of virus isolated from the patient and the gray mice as lymphocytic choriomeningitis was performed, in each instance, by demonstrating the specific soluble antigen[11] of choriomeningitis in extracts of the spleens of guinea pigs inoculated with the original material as well as certain subsequent passage material This was corroborated by the neutralization of both strains of virus with known hyperimmune lymphocytic choriomeningitis (W E.) guinea pig serum[9] In addition, guinea pigs immune to the W E strain of virus were not susceptible when inoculated intracerebrally with the recently isolated strains of virus and, conversely, guinea pigs immune to the newly isolated strains of virus were not susceptible when inoculated intracerebrally with the W.E strain of lymphocytic choriomeningitis virus.

In order to substantiate further the concept that the newly isolated strains actually were derived from the patient and the

gray mice trapped in the granary, the original materials which had been stored at dry ice box temperature were again inoculated into healthy mice and guinea pigs. Lymphocytic choriomeningitis virus was again identified in each original inoculum. Finally, in the patient a rising titer developed of both complement-fixing and neutralizing antibodies in the blood to his own strain of virus as well as to the virus isolated from the brains of the gray mice trapped in the granary.

Serologic Study.—The diagnosis of lymphocytic choriomeningitis in the patient was corroborated by the appearance of a rising titer of complement-fixing and neutralizing antibodies in the blood to the W. E. strain of lymphocytic choriomeningitis virus.[12] Because of the isolation of virus from the brains of gray mice trapped in the granary where the patient worked, an attempt was made to determine the serologic response of 6 other boys who had worked in the same room. Serum was obtained from all 6 boys two and one-half months after the onset of disease in the patient. These boys had been at work in the granary for periods ranging between three and fourteen months. None of them had been sick during this time, and none of them had demonstrable complement fixing or neutralizing antibodies to the strains of lymphocytic choriomeningitis virus isolated from the patient or the infected mice, or to the W. E. strain of virus.

COMMENT

The patient had been working in the granary for tem months before he became sick. During this time, he had frequently removed dead mice from traps, the last time being two to three weeks before the onset of disease. The other 6 boys who had worked in the same room for periods ranging from three to fourteen months did not recall handling mice at any time, suggesting that they may not have had sufficient exposure to virus to become infected. The possibility exists, of course, that 3 of them who had been there from seven to fourteen months might have been infected, with a subsequent disappearance of antibodies, although this is not likely in view of the apparent persistence of neutralizing antibodies in the blood of infected persons.

Of particular interest, then, is the fact that of 7 boys working in a room known to harbor mice infected with lymphocytic choriomeningitis virus, the only one to contract the disease was a boy who frequently removed mice from traps. Although the manner of spread of this disease to man is not known exactly, the evidence presented in this paper suggests that even in an infected focus the opportunity for man to acquire the disease may, at times, depend on such close contact with infected mice as occurs in handling them or materials contaminated with their excreta. Because of this, it would seem practicable to recommend the use of forceps or a paper towel to remove house mice from traps, with careful washing of the hands after such an operation.

SUMMARY

Lymphocytic choriomeningitis virus was isolated from the spinal fluid and blood of a patient with the disease, and also from the brains of gray mice trapped in the granary where he worked. Six other boys who had worked in the same granary for periods ranging from three to fourteen months had no demonstrable complement-fixing or neutralizing antibodies to this virus.

To Test the Scope of the Experimental Method.—In 1901 Rockefeller Institute for Medical Research was founded. Though the idea was one man's, though it was made real through the beneficence of another, though its form was determined by physicians who were scientists as well, it must be deemed a folk expression. For it was what Americans wanted; since pioneer days the homely "try and see" had been their habit, and of late they had begun to have exciting thoughts on what experiment might bring to pass for the betterment of life, if carried out in a large way. Research institutions had already been set going in Europe, but The Rockefeller Institute had a larger aim: it was to test the scope of the experimental method as such.—Peyton Rous, Simon Flexner and Medical Discovery, Science, June 11, 1948.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

SUPPLEMENTAL REPORT ON ORGANOMERCURIAL COMPOUNDS

The Council authorizes the publication of the following papers by John H. Brewer, Ph. D., of the Biological Research Laboratory, Hynson, Westcott & Dunning, Inc., Baltimore, Md., and H. M. Powell, Sc. D., of the research laboratories of Eli Lilly and Company, Indianapolis, in reply to the Report of the Council (J. A. M. A. 136:37-41 [Jan. 3] 1948), "The Bacteriostatic and Bactericidal Actions of Some Mercurial Compounds on Hemolytic Streptococci," by H. E. Morton, L. L. North and F. B. Engley Jr. The authors (Morton and his coworkers) of the original report have commented on the papers by Drs. Brewer and Powell. The Council believes that these comments should be published as part of the supplementary report on organomercurial compounds.

REDUCTION OF INFECTIVITY OF CERTAIN PATHOGENIC BACTERIA BY "MERCUROCHROME"

JOHN H. BREWER, Ph.D.
Baltimore

In a recent report the Council on Pharmacy and Chemistry of the American Medical Association, commenting on the article, "Bacteriostatic and Bactericidal Actions of Some Mercurial Compounds on Hemolytic Streptococci" by Morton, North and Engley,[1] expresses deep concern as to the value and usefulness of certain mercurial antiseptics, including "mercurochrome" (merbromin N.F.). As a matter of fact, a challenge was made to the manufacturers of mercurial antiseptics in the statement that this "is a field in which wishful thinking is dangerous," and experimental verification of the usefulness of the products was requested. It seems that the Council is mainly impressed by these observations which presume to show that the infectivity of hemolytic streptococci has not been impaired by treatment with mercurial antiseptics. In reply my associates and I submit laboratory data which answer this question and others raised by the Council.

Although the technic described in this report does not simulate conditions of clinical use, in order to avoid argument this technic has been utilized in our laboratory study. The laboratory evidence which has been obtained from this study of well over 2,000 mice infected with the same strain of hemolytic streptococcus C 203 as used by Morton and also

[1] Morton, H. E.; North, L. L., and Engley, F. B., Jr.: The Bacteriostatic and Bactericidal Actions of Some Mercurial Compounds on Hemolytic Streptococci, J. A. M. A. 136: 37-41 (January 3) 1948.

with other pathogenic bacteria enables us to state that the infectivity of bacteria treated with solutions of “mercurochrome” is not only definitely impaired but in many instances is completely nullified.

In accordance with the Council's suggestion, furthermore, observations have not been limited to one organism or to one species of animal; it is therefore believed that the results completely answer the challenge as made.

For example, it has not been possible to substantiate the statement made by Morton and associates in their summary, namely: “Hemolytic streptococci, an example of non-spore forming pathogenic organisms, while in a state of bacteriostasis produced by a mercurial compound, are still infectious for the animal body. Bactericidal rather than bacteriostatic action of the compounds is necessary to prevent a generalized infection.” On the basis of laboratory experiments using a far greater number of animals and different species of infecting organisms, it has been determined that bacteria in a state of bacteriostasis cannot be reactivated by the animal body to produce infection except when massive doses are used--and even then the great majority of animals survive. These results therefore show that bacteriostasis practically eliminates the chance of infection.

TABLE 1.—*Results of Intraperitoneal Injections into Mice of Various Dilutions of Streptococcus C 203 Culture Which Has Been Exposed to 1 per cent “Mercurochrome” Ten Minutes*

Ten Mice Received Each Dilution

Number of Mice Dead at End of 7 Days

Dilution of Culture	1:10	1:100	1:1,000	1:10,000	1:100,000
C 203 culture control (no drug)	10	10	9	7	3
C 203 culture treated with 1% “mercurochrome”	2	0	0	0	0
Drug control 1% “mercurochrome” (no culture)	0				

It should be noted that all animals received injections of 0.1 cc. of the culture rather than 1 cc., and for this reason the minimum lethal dose may appear to be less than that obtained in the usual C 203 titration.

TABLE 2.—*Results of Intraperitoneal Injections into Mice of Various Dilutions of Streptococcus C203 Culture Which Has Been Exposed to “Mercurochrome” for Ten Minutes*

Forty Mice Received Each Dilution

Number of Mice Dead at End of Seven Days

Dilution of Culture	1:10	1:100	1:1,000	1:10,000	1:100,000	1:1,000,000
C203 culture control (no drug)	40	39	37	28	9	4
C203 culture treated with 1% “mercurochrome”	8	9	3	3	0	0
Drug control 1% “mercurochrome” (no culture)	0					

Culture, 0.1 cc. of C203M, injected intraperitoneally with or without 1 per cent “mercurochrome.

Forty mice had injections of 0.1 cc. 1 per cent “mercurochrome” intraperitoneally as a drug control.

The experiments further prove that the initial study was far too limited in scope. If greater numbers and different species of animals had been used, and if the minimum lethal dose or reasonable multiples thereof had been used as an inoculation, an entirely different picture would have been presented--as will be demonstrated by the experimental work.

In tables 1 and 2 is shown the protection afforded mice inoculated with various dilutions of C 203 which had been previously exposed to 1 per cent solution of “mercurochrome” for ten minutes. A study of these tables reveals clearly that the infectivity of the organism was so reduced by treatment with the mercurial that the great majority of mice survived the test—even when the greatest concentration of culture was injected. Table 1 illustrates a single experiment in the series, whereas table 2 is the composite of of all experiments.

In order to prove beyond question the fact that it is the mercurial compound which affords protection by impairing the infectivity of the organism, table 3 presents the results obtained by neutralizing “mercurochrome” in the animal body by injections of BAL. These results as outlined in tables 1, 2 and 3 prove conclusively that the infectivity of the pathogenic organism C 203 is significantly impaired by exposure to “mercurochrome” solution. These facts will be illustrated in more detail in the discussion on experimental work which follows, which also further answers the Council's challenge. The scope of the experiments has been broadened by the use of other pathogenic organisms, other routes of inoculation and larger animals. The observations in these respects cast some doubt on the usefulness of the Morton technic for purposes of determining adequately the clinical usefulness of mercurial antiseptics.

TABLE 3.—*Results of Intraperitoneal Injections into Mice of Various Dilutions of Streptococcus C203 Culture Which Has Been Exposed to “Mercurochrome” for Ten Minutes and Then Injected with BAL*

Ten Mice Received Each Dilution

Number of Mice Dead at End of Seven Days

Dilution of C203M	Infusion Culture Control	C203M 1% “Mercurochrome” Mixture		
		No BAL	BAL - 2 Hr.	BAL - 6 Hr.
1;10	10	2	10	1
1:1,000	10	0	10	0

Numbers represent the deaths among 10 mice receiving injections in each dilution.

BAL control — 10 mice had intramuscular injections of 9.1 cc. 1 per cent BAL — no deaths resulted.

A virulent culture of C203M was diluted 1:10 and 1:1,000 in 1 per cent “mercurochrome.” After ten minutes exposure of the organisms to the mercurial compound, 50 mice received intraperitoneal injections of 0.1cc of the 1:10 dilution and 59 mice, the 1:1,000 dilution.

At intervals of two and six hours, 10 mice with injections of each dilution received 0.1 cc. 1 per cent BAL in oil intramuscularly.

EXPERIMENTAL WORK

Using the same technic for determining the virulence of the culture, it was possible to prove that the culture used in the current study was of equivalent virulence. Although a large percentage of the data of Morton, North and Engley is given over to determining the minimum lethal dosage of their culture, only a 1:10 final dilution of culture was used in testing the mercurial compounds. This dilution of culture represents many thousands of organisms, and since these workers stated that four organisms produce death in control animals, it was of interest to determine the protective value of the mercurial compounds in terms of multiples of lethal doses. It should be noted at this point that it was not possible to study the effect of 2 per cent "mercurochrome" solution used in the report to the Council. According to observations in the present experimental work, 2 per cent solution of "mercurochrome" cannot be used because the 0.1 cc. quantity is greater than LD/50 for mice.

Utilizing a culture of streptococcus C 203 M obtained from Dr. Morton and also a strain of C 203 which was obtained from Drs. Long and Bliss, Johns Hopkins School of Hygiene and Public Health, the experiments were repeated many times, using over 100 mice in each experiment. In addition to the 1:10 dilution of the culture in the antiseptic mixture used by these workers, 1:100, 1:1,000, 1:10,000 and 1:100,000 dilutions of the culture in antiseptic were also made. Protection afforded by the mercurial compound can readily be seen from data in tables 1 and 2 which were referred to previously.

Even though thousands of lethal doses of organisms are present in the 1:10 dilution, it was possible to get better than 80 per cent protection at this dilution. In all other dilutions of the culture an even higher percentage of protection was obtained.

From a consideration of the data in tables 1 and 2, it is rather apparent that bacteriostatic activity has effectively reduced the infectivity of the organism. In order to prove that it is the bacteriostatic effect of the mercurial compound and not the natural defenses of the body or even germicidal activity, the experiments outlined by tables 1 and 2 have been repeated. However, in this series 2,3-dimercaptopropanol (BAL) has been used to neutralize the mercurial agent in vivo. It is well recognized that this is an extremely powerful neutralizing agent for heavy metals. (This dimercaptan readily forms insoluble salts with mercury and many other heavy metals.)

The results of these series of experiments are presented in table 3. It can be seen that if 2,3-dimercaptopropanol is not injected, the results are identical with those reported in tables 1 and 2. If, however, 0.1 cc. of the agent in oil is injected into each animal two hours after the "mercurochrome"-treated bacteria, all the animals die of a streptococcic septicemia. This indicates clearly that 2,3-dimercaptopropanol neutralized the mercurial agent which was in or on the treated bacteria, and those bacteria freed of bacteriostatic restraint were thereby enabled to cause death. From this significant experiment it can be said that by holding an organism bacteriostatically a general infection may be prevented.

Another important fact is outlined in table 3. When 0.1 cc. of the drug in oil is injected into each animal six hours after the treated bacteria, the results are quite similar to those obtained in the series of animals not given injections of the drug. This experiment strongly indicates that the defense mechanisms of the body have taken care of the bacteria which had been held bacteriostatically until such time. This experimental work has been extended to include a study of phagocytosis and actual time of death of various organisms within the animal body and forms the basis of a much longer report to be published shortly.

In answer to the Council's question as to "whether other infectious agents would differ and lose their virulence when exposed to mercury may well be investigated," a pathogenic pneumococcus type I, obtained from Drs. Long and Bliss, has been used. The results of these experiments are shown in tables 4 and 5. It is immediately evident that complete protection is afforded by the exposure of the organisms to 1 per cent "mercurochrome," even in the 1:10 culture dilution.

TABLE 4.—*Results of Intravenous Injections into Mice of Various Dilutions of Pneumococcus Type I Which were Exposed to "Mercurochrome" for Fifteen Minutes*

	Ten Mice Received Each Dilution			
	Number of Mice Dead At End of Seven Days			
Dilution of culture	1:10	1:100	1:1,000	1:10,000
Pn1-culture control (no drug)	10	10	10	9
Pn1 culture treated with 1% "mercurochrome"	0	0	0	0
Drug control 1% "mercurochrome" (no culture)	0			

Another fact demonstrated by this table is that injection is made by the intravenous route rather than by the intraperitoneal route. The same result, that is, complete protection, is obtained by both routes of injection. The reason that "mercurochrome" gave as good protection by the intraperitoneal injections was not because of the phagocytic response or local tissue reaction in the peritoneal cavity. This is proved by the protection which was also afforded when the intravenous route of injection was used. It was not possible to repeat Morton, North and Engley's type of experiment using the intravenous route with C 203, since it took many thousands more organisms to kill the controls by this route and only sporadic deaths occurred with use of the 1:10 dilution. This route of injection is exceedingly important in considering the clinical usefulness of the organic mercurial compounds. Since they are used primarily as local or topical antiseptics, it is evident that one of the most important routes by which bacteria may get into the body from a wound is the intravenous route.

In an effort more closely to approach the clinical use of these mercurial compounds, laceration experiments were made on several hundred mice by various methods. The mice were lightly etherized, and a high speed grinder was used to produce a surface wound. Another method was also used: many razor blades were bolted together with 1/32 inch (0.08 cm.) spacing washers and uniform cuts were made through a fiber guide. The straight virulent cultures were mopped into these wounds, and then at various times the several antiseptics and germicides were applied. Since the controls which received the straight culture and no antiseptic would not be infected in many instances, and never consistently, these results are not tabulated in this present paper.

Table 5.—*Results of Intravenous Injections into Mice of Various Dilutions of Pneumococcus Type 1 Culture Which Had Been Exposed to Mercurochrome for Ten Minutes*

	Fifty Mice Received Each Dilution			
	Number of Mice Dead at End of Seven Days			
Dilution of Culture	1:10	1:100	1:1,000	1:10,000
PnI culture control (no drug)	31	26	5	7
PnI culture treated with 1% "mercurochrome"	0	0	0	0
Drug control 1% "mercurochrome" (no culture)	0			

It is apparent that the pneumococcus in this experiment was less virulent than when the experiment shown in table 4 was performed. However, the mice were all protected in each case.

We were unable to infect guinea pigs or rabbits with straight cultures of these organisms employing the technic used in the report to the Council, even though corrections were made for body weight. Therefore, the effectiveness of "mercurochrome" in larger animals could not be studied by this technic.

For more than ten years we have been well aware that mercurial compounds are not germicides in the strict sense of the word; this has been pointed out at length in two previous articles in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION.[2] In November 1947 the spore suspensions of the various organisms referred to in the 1939 article,[2a] which had been exposed to the market strength of the various organic mercurial preparations, for ten years were opened and planted into thioglycollate medium, and without exception they all grew out within forty-eight hours. A full discussion of this experiment is given in the paper mentioned earlier in this report.

A lengthy discussion of this subject might well be written, but the Council has stated that their interest is in "experimental verification" of the ability of mercurial compounds to impair the infectivity of these organisms and this has been the subject of this study.

Other organic mercurial preparations listed in New and Nonofficial Remedies have been studied in this series, but since the investigations have not been as extensive as with "mercurochrome" solutions tabulations of the results with these compounds are deferred.

SUMMARY

1. The Council on Pharmacy and Chemistry has previously presented as a report the work of Morton, North and Engley[1] challenging the scope of usefulness of mercurial antiseptics. The specific questions raised by that report and the Council have been answered herein by experimental evidence. This has been accomplished by extending their work and by introducing new experimental data.

2. Experimental results obtained in a study of intraperitoneal injection of "mercurochrome" (merbromin)-treated hemolytic streptococci strain C 203 indicate (tables 1 and 2) that more than 80 per cent of the animals survive even massive inoculations of thousands of lethal doses of organisms so treated.

3. Experimental results obtained in a study of another route of infection, namely, intravenous injection of "mercurochrome"-treated pneumococci type 1 indicate (tables 4 and 5) that all animals survive the massive inoculations of thousands of lethal doses of organisms so treated.

4. Experimental results obtained in scarification experiments, which would more closely simulate clinical use, were inconclusive in that control animals could not be consistently infected.

5. Experimental results obtained in the study of intraperitoneal injection of "mercurochrome"-treated bacteria, followed by the injection of the mercurial neutralizer BAL, indicate (table 3) that it is the bacteriostasis produced by the mercurial compound which prevents the death of the animals.

6. These experimental results therefore prove that bacteriostasis resulting from the treatment of pathogenic bacteria with 1 per cent solution of "mercurochrome" impairs the infectivity of these bacteria to such an extent that the chance of infection is practically eliminated.

ANTIBACTERIAL ACTION OF "MERTHIOLATE" AGAINST HEMOLYTIC STREPTOCOCCI

H. M. POWELL, Sc. D.
Indianapolis

The recent report of Morton and collaborators[1] dealing with the purported lack of germicidal action of organomercurial coumpounds prompts the submission of this brief report. It is neither supportive nor contradictory of the Morton publication; rather, it is intended to point out the manner in which the outcome of experiments of this sort is influenced by some of the conditions on the laboratory bench which are frequently given little consideration by laboratorians and readers alike.

To judge from the results observed during the past several years in experiments in the laboratory with organomercurial agents (and other compounds of the germicide-antiseptic-disinfectant group), sulfonamide drugs and various antibiotics in rather large numbers, three main conditions of testing may affect the outcome of the tests considerably. These are temperature, time and quantity of bacteria. Chick and Martin[2] some forty years ago dealt with such varying conditions, but lately they have not been given much consideration.

To simplify the problem tests similar to those of Morton and his associates have been conducted, using the same technic and the same bacterium; namely, the mouse-virulent hemolytic streptococcus strain C 203 and "merthiolate" (sodium ethylmercurithiosalicylate). No other organomercurial compounds are dealt with in this particular report. Also, the report does not touch on phenol (which the previous workers[1] included) at this time, because a recent publication[3] has indicated that phenol-"killed" bacteria can be "resurrected" by special methods of cultivation which I have not studied.

The culture has been medicated at two temperatures, namely, at room temperature (as used by Morton and collaborators, and which of course is exceedingly indefinite) and also at 37 C. Instead of one dilution, a series of decimal dilutions of test culture have been used and medication of the culture with "merthiolate" has been extended from five minutes up to sixty minutes.

After various periods of medication of bacterial culture with the organomercurial compound, inoculums from such tubes were *(a)* planted into thioglycollate broth and incubated at 37 C. for seven days and *(b)* injected intraperitoneally into white mice, which in turn were observed for seven days (in case survival was this long).

The thioglycollate broth was that specified by the National Institute of Health for sterility tests and was the same variety as employed in the original study.[1] The white mice used here were from a stock used during several years for chemotherapy tests of numerous drugs (mostly sulfonamide drugs and antibiotics) and were fatally vulnerable to intraperitoneal injections of 10^{-7} to 10^{-8} dilutions of hemolytic streptococcus C 203.

The results of these tests under varied conditions are as anticipated; they show that the effectiveness of "merthiolate" in the form of aqueous solution depends on temperature, time and quantity of bacteria. The results, moreover, are about the same as judged either by whether medicated culture shows growth in thioglycollate broth or whether it kills mice. Under the conditions that were used, "merthiolate" although it appears to be ineffective at room temperature, is effective at 37 C.

The upper portion of the accompanying table shows the details of the tests conducted at room temperature. Other than slight action at the longest exposure, the organomercurial agent appears here to be without germicidal action. These results are similar to those obtained under similar conditions when thioglycollate broth first came into use in this way in 1941, and also when medicated virulent bacteria under the same conditions were injected into animals in this laboratory in 1929.[4] Furthermore, these results agree with those of Morton, North and Engley.

The bottom portion of the table shows the details of the tests conducted at 37 C. "Merthiolate" 1:1,000 in 5 cc. quantities appears to be germicidal for 0.1 cc. of a 10^{-2} dilution of culture in fifteen to thirty minutes. It seems from these results that either the thioglycollate broth or the mice may be depended on in most instances to give true answers as to the presence of viable bacteria. In prolonged tests top virulence is apt to drop before the viability of the culture is affected. This is evident in many kinds of chemotherapeutic tests not reported here.

The largest doses of hemolytic streptococci medicated with the mercurial agent in the foregoing tests were less in volume than the single doses used by Morton and others. However, the largest doses, namely, 0.1 cc. of undiluted culture, comprise approximately 1,000,000 MLD (minimum lethal doses) for white mice, and this appears to be a somewhat higher number of MLD than Morton and associates employed. Doses of 0.1 cc. 10^{-5} and 0.1 cc. 10^{-6} dilutions of culture were tried (but the results are not shown here); these gave erratic results for obvious reasons.

[4] Series of records in this laboratory, of dates during March and April, 1929.

In the last twenty years a flood of laboratory publications dealing with antibacterial titers of one kind or another has appeared on germicides, antiseptics, disinfectants and other antibacterial agents, and also, especially during the latter half of this time, many such laboratory papers have appeared on antibiotics. Lately many additional publications have appeared on inhibitory agents which block the biologic action of many types of biologically active agents both synthetic (as for example some of the germicide-antiseptic-disinfectant group) and natural (as, for example, the antibiotics). None of these need to be referred to here.

Use on the laboratory bench of inhibitors such as thioglycollate for organomercurial compounds, para-aminobenzioc acid for sulfonamide drugs, penicillinase for penicillin and so on has advanced knowledge academically about the precise mode of toxic action of a given chemical agent against the bacterial cell. Perhaps on the basis of these tests and injections of medicated cultures into animals, various antibacterial agents of the antiseptic-germicide-disinfectant group might be reclassified; however, this would likely contribute to more artificiality rather than fill a definite need in view of the results herewith reported.

The concept that the toxic action of any given antibacterial drug for a bacterial cell comprises a zone of action rather than a point has been reviewed by Marshall and Hrenoff.[5] These authors indicate that in the antibacterial "spectrum" of a given drug there is a gradual merging of overly strong, nonuseful concentrations of such drug into germicidal concentrations; these in turn merge into bacteriostatic concentrations, and these then even merge in some instances into stimulatory concentrations. All zones except the last one comprise zones of action in which the drug is toxic to bacteria. Failure of laboratory experimenters to keep some such concept in mind along with effects of temperature, time and quantity of bacteria, as has been indicated, leads to "proving" and "disproving," without end, one drug after another. There is added confusion in that the terms germicide, antiseptic and disinfectant have different meanings to different persons, and exact definitions have to be arbitrary.

It is regrettable that there seems to be no single method of assaying the likely efficacy of drugs of the germicide-antiseptic-disinfectant group. These agents are commonly put to such varied jobs that no single assay seems possible. A single assay is as yet impossible for another reason; namely, no one knows with certainty how to measure quantitatively the good accomplished by these drugs when they are used as they have been and will be used.

Tests of Germicidal Action of "Merthiolate" Against Hemolytic Streptococcus C203

[5] Marshall, M. S., and Hrenoff, A. K.: Bacteriostasis, J. Infect. Dis. 61:42-54, 1937.

CONCLUSIONS

1. "Merthiolate" (sodium ethylmercurithiosalicylate) is germicidal at normal temperature against a range of seemingly small doses of virulent hemolytic streptococci, extending from the smallest up to doses of about 0.1 cc. of 10^{-2} dilution of culture in fifteen to thirty minutes.

2. Such doses of virulent culture, however, are of considerable biologic activity and importance, since this maximum dose contains about 100,000 MLD for white mice.

3. The extent of antibacterial action (germicidal, antiseptic or disinfectant) frequently depends, as has been pointed out before, on temperature, time and quantity of bacteria used.

4. Experience with numerous antibacterial tests and study of the literature on this item (which is about as old as bacteriology) indicate that there is no single method of test or assay of the practical usefulness of this type of drug. A series of diversified tests of each drug should give indications of usefulness.

June 3, 1948

Dr. Austin Smith, Secretary
Council on Pharmacy and Chemistry
American Medical Association
535 North Dearborn Street
Chicago 11, Illinois

Dear Dr. Smith:

Thank you for submitting for our inspection and comments the paper entitled "Antibacterial Action of 'Merthiolate' Against Hemolytic Streptococci," by Dr. H. M. Powell of the research laboratories of Eli Lilly and Company, which has been accepted for publication in THE JOURNAL.

We believe that it is a good item to publish in THE JOURNAL and that the results are important especially because they come from the laboratories of the company which produces and manufactures "merthiolate." The work appears to be carefully planned and carried out. The paper is concise and readily understandable as far as it goes. There are one or two points which we think should be verified to make sure that an error has not been made in typing. In table 1, is the amount 0.05 cc. correct for the amount which was injected into the mice, or should it be 0.5? The former amount is rather impractical to inject accurately into mice.

If the amount 0.05 cc. is correct, then we believe that an error has occurred, as 0.1 cc. of undiluted culture would contain 20,000,000 M.L.D., which were exposed to the action of merthiolate. When 0.05 cc. of the culture-"merthiolate" mixture was injected into mice, the mice would be receiving approximately 200,000 M.L.D. as compared with approximately 500,000 M.L.D. employed by us. Dr. Powell states that he used a somewhat higher minimum lethal dose than we did, but our calculations from his data indicate that he used fewer organisms. It does not alter the picture, but should be clarified for the sake of accuracy in his paper.

Our comments on the paper are as follows:

While Powell states in the first paragraph of his paper that his report is neither supportive nor contradictory of the article by us, the results given in table 1 of his paper are supportive of the statements in the first two paragraphs of the summary in our article. It is well to have this additional supportive evidence from the manufacturers of "merthiolate" to add to the other publications that growth in thioglycollate medium of hemolytic streptococci exposed to "merthiolate" parallels fairly well infectivity for mice.

When 0.1 cc. of culture is mixed with 5 cc. of 1:1,000 aqueous "merthiolate" solution, at room temperature, the results are the same as when water is employed (table). At 37 C. the culture-"merthiolate" mixture had to be held thirty minutes or longer before the compound showed more killing action than water. Only when the number of test organisms was greatly reduced and the temperature of medication was raised to 37 C. was there killing action, but the label on the product as purchased on the open market makes no reference to these limitations of the compound.

One questions that "merthiolate," as it may be used in the practice of medicine or surgery, reacts with infectious micro-organisms at a temperature of 37 C. It is used topically, and the temperature of the surface of the body is generally less than 37 C. (usually it is 30 to 33 C.). Tests have been made on the anti-infecting power of "merthiolate" when used topically, and no protective action was evidenced (work of Nungester cited in more detail later), as one would surmise from the results in table 1 of Powell. Dr. Powell states that "room temperature" as employed by us is indefinite and that he used 37 C. in addition to room temperature. We added undiluted culture to "merthiolate" and allowed it to act on the streptococci for a period of ten minutes at room temperature before injecting into mice. In the results given by Powell in his table 1, with undiluted culture acted on by "merthiolate" it can be seen that no killing action and no protective action was afforded by the "merthiolate" in an exposure of ten minutes at either temperature, so that it is unimportant that we employed only one temperature of medication, namely, that of the room.

It is true that temperature, time and quantity of bacteria affect the outcome of germicidal tests, as Powell states, citing the publication of Chick and Martin of 1908, but there are other important factors which have been noted in the interim. The nature of the environment of the micro-organism can be listed as one of the additional factors, and the publication of Smith, Czarnetsky and Mudd of 1938 was mentioned in our article to call attention to one of the peculiarities of mercury compounds which are used as germicides.

The element of time is important, and frequently it is impractical for the physician or surgeon to wait thirty or more minutes for a compound to exert its germ-killing action, as one might have to do according to the results given in table 1.

The bacteriologist, physician or surgeon never knows the quantity of micro-organisms which he has to destroy. He is usually interested in killing all pathogenic micro-organisms or reducing the number to prevent infection. It is only logical to use cultures of the test organism as they normally grow in appropriate culture mediums, and not a thousandfold or greater dilutions of the test culture, in testing the in vitro killing action of compounds.

Paragraph ten of Powell's article needs to be clarified. As it now stands, it erroneously gives the impression that Powell used a greater minimum lethal dose than we did. According to the legend at the bottom of table 1 (Powell) 0.05 cc. of 10^{-7} dilution of the culture of hemolytic streptococci killed all of the mice (2) inoculated. This would indicate that the culture originally contained 200,000,000 MLD per cubic centimeter. Only 0.1 cc.

of the culture was added to 5 cc. of "merthiolate" solution, and 0.05 cc. of this mixture was subsequently injected into mice. If none of the streptococci were killed, this would indicate that the mice received approximately 200,000 MLD each. The culture used by us contained about 10,000,000 MLD per cubic centimeter. One cubic centimeter of the culture was added to 10 cc. of "merthiolate" solution, and 0.5 cc. of this mixture was subsequently injected into mice. If none of the streptococci were killed, this would indicate that the mice received approximately 500,000 M.L.D. each. When using undiluted culture, Powell was employing less than one-half the number of organisms employed by us, and when using 10^{-4} dilution of the culture he was employing only 20 M.L.D. of streptococci. An exposure of fifteen minutes at 37 C. was required to render these few lethal doses of culture harmless, even when the organisms were suspended in an aqueous medium.

Powell states that the use of inhibitors, such as thioglycollate for organomercurial compounds, has advanced knowledge academically about the precise mode of toxic action of a given chemical agent against the bacterial cell and that this might lead to a reclassification of the antibacterial agents, but this would likely contribute to more artificiality rather than fill a definite need. It is universally known that there are sulfur-containing compounds in the human body, and it is well known that sulfur compounds can inactivate the antibacterial action of mercurial compounds. Our investigation and Powell's show that the animal body is even slightly better than a thioglycollate-containing medium in this neutralizing effect and in supporting growth of virulent hemolytic streptococci. Our paper and Powell's show that growth of "merthiolate"-treated streptococci in thioglycollate medium is proof that the organisms are still infectious if introduced into the animal body. This is ample evidence that knowledge of the mode of action of the mercurial compounds has led to the devising of a more effective test for the anti-infecting property of the mercurial compounds. Attempts at evaluating the power of a compound in preventing infection following topical application required surgical procedures (Nungester, W. J., and Kempf, A. H.: An "Infection-Prevention" Test for the Evaluation of Skin Disinfectants, *J. Infect. Dis.* 71:174, 1942). By the use of thioglycollate medium comparable information can be obtained more easily, more quickly and more economically. Nungester and Kempf observed that, following the application of a culture of pneumococci to the skin of a mouse, treating the area with aqueous "merthiolate," 1:1,000, and then placing the skin in the peritoneal cavity of the same mouse resulted in death of all the mice of pneumococcic infection. The control mice treated with isotonic sodium chloride solution also showed 100 per cent mortality. Mice so treated, except with a culture of streptococci, and then aqueous "merthiolate," 1:500, likewise showed 100 per cent mortality. The observation by Nungester and Kempf that aqueous "merthiolate," 1:500 and 1:1,000, had no protective action, which in that respect was comparable to isotonic sodium chloride solution, is in line with the observation of Powell that aqueous "merthiolate," 1:1,000, is comparable to water, in that no killing or protective action was exerted on an undiluted culture of hemolytic streptococci at room temperature.

ture by Powell deals with the toxicity of "merthiolate" for streptococci cells. No mention is made to its toxicity for tissue cells. In addition to the several references which were given in our article on the toxicity of the organomercurial compounds for tissue cells, there should be added the articles by Gaul and Underwood and his co-workers (Gaul, L. E.: Overtreatment Dermatitis, J.A.M.A. 127:439 [Feb. 24] 1945; Underwood, G. B.; Gaul, L. E.; Collins, E., and Mosby, M.: Overtreatment, Dermatitis of Feet, J.A.M.A. 130:249 [Feb. 2] 1946). In the later article the authors report that of their 400 dermatologic patients, 40 per cent of the patients (160) showed an allergic reaction to one or more of the remedies used and in 35 per cent (56) of the positive reactions the offending substance was one of the organic mercurials. Furthermore, "merthiolate" was responsible for the reactions in 90 per cent of the patients who reacted to an organic mercurial.

The works of Salle and Lazarus, Nye and Welch (cited in our article) all reported "merthiolate" more toxic for tissue cells than for bacterial cells.

In spite of the numerous publications by competent investigators on the extremely weak action of "merthiolate" on bacteria and in preventing infection and its greater toxicity for tissue cells than for bacterial cells, the product bears the label "A stable, stainless, organic mercury compound of high germicidal value, particularly in serum and other protein media." Our work and that of Powell and of Nungester (Nungester and Kempf as well as Nungester, Hood and Warren, Proc. Soc. Exper. Biol. & Med. 52:287, 1943) demonstrate that the bacteriostasis, so far as "merthiolate" is concerned, is not sufficient to prevent infection.

The authors of the original Council report on organomercurial compounds also commented on Dr. Brewer's paper as follows, under date of June 9 1948:

Our comments on the paper "Studies on the Reduction of Infectivity of Certain Pathogenic Bacteria by 'Mercurochrome,' " by Dr. John H. Brewer, of Hynson, Westcott and Dunning, are as follows:

It seems to us unfortunate that the report by Brewer deals with the subject of antisepsis by mercurial compounds more in the spirit of controversy than as an objective exposition of the essential facts of the situation. Although there are many points in his manuscript to which exception could be made, we prefer to confine our remarks to the essential and relevant facts.

It is the usual procedure to employ culture and germicide in the ratio of 1 part of undiluted culture to 10 parts of germicide in the in vitro testing of germicides, as we used, and not several tenfold dilutions of the test culture. In Brewer's work with bacterial spores along these lines (THE JOURNAL, 1939), he did not use decimal dilutions of the cultures.

The observation by Dr. Brewer that 2 per cent solution of "mercurochrome" was toxic for mice in 0.1 cc. amounts injected intraperitoneally supports our observations; even though some of the mice receiving the 2 per cent "mercurochrome" solution and streptococcus mixture died from causes other than streptococcic infection, some did die of an apparent streptococcic infection (table 3, Morton); this represents the solution of "mercurochrome" supplied to the trade.

The same strain of a particular micro-organism may behave differently in different laboratories and in the hands of different investigators. Although Powell and Brewer and we used the same strain (C-203) of hemolytic streptococci, their

SATURDAY, JULY 3, 1948

THE 1948 SESSION

Exactly 11,963 Fellows of the American Medical Association registered their attendance at the Annual Session of the American Medical Association held in Chicago June 21-25. The physicians began pouring into the city during the preceding week for attendance on the Interamerican Cardiological Congress and a score of specialistic society meetings concerned with many different aspects of medicine. The trustees, the officers and many councils and committees of the Association began their meetings and continued into the Annual Session.

Among the unusual features of this session were a series of television programs sent by short wave to the Navy Pier, medical schools, hospitals and hotels; an athletic performance in which the participants were persons handicapped by amputation and other disabilities; a complete series of exhibits related to atomic energy associated with a series of papers that covered this subject; the adoption of a new constitution and bylaws by the House of Delegates which serve to facilitate more prompt and decisive action on subjects of interest to the House of Delegates, and with all this a series of public meetings, social gatherings and educational features seldom equalled in any other organization. Indeed, the Annual Session of the Association, which last year included almost 16,000 Fellows and this year about 12,000, represents an assemblage which in quantity of attendance and material reaches four or five times the scope of any other medical assemblage.

Unfortunately, the Republican National Convention secured most of the available good space in the press and over the radio, so that concentration of the public on the doings of scientific medicine was difficult to stimulate. Nevertheless the total number of radio programs was far above that of any previous Session. Television programs were also "short-waved," "televised" or "videoed" during the meeting.

Among the subjects that aroused much interest in the House of Delegates were consideration of the various prepayment plans for hospitalization and medical care, the practice of medicine by hospitals, the question of cooperation with the American Red Cross in the establishment of a nationwide blood bank system, the establishment of a new council on rural health and medical care and a variety of reactions toward past, present and future medical events. While some resolutions were introduced that might have had the effect of "upsetting the apple cart," the delegates carefully considered all these proposals in properly constituted reference committees which heard great numbers of interested physicians and then brought to the House of Delegates mature opinions which in a majority of instances received ready acceptance by the House. The great stability and scope of the American Medical Association and its system of organization and operation tend to the avoidance of hasty actions based on insufficient information.

Unusual at this Session of the American Medical Association was a considerable change in the officers of the Association resulting largely from the termination of terms of service by trustees and other officers, so that the House of Delegates now has a new Speaker, Dr. Francis F. Borzell of Philadelphia, a new Vice-Speaker, Dr. James R. Reuling, Bayside, N. Y., three new Trustees, Drs. Walter B. Martin of Norfolk, Va., Edwin S. Hamilton of Kankakee, Ill., and Gunnar Gundersen of LaCrosse, Wis., as well as new members on the Council on Medical Education and Hospitals, Medical Service and Scientific Assembly. Dr. Roy Fouts, who has served for some years as Speaker of the House of Delegates, was elevated to the Vice-Presidency of the Association and received a great ovation from the House of Delegates in recognition of his earnestness and manifest fairness in his decisions as Speaker of the House. With the assumption of the Presidency of the Association by Dr. R. L. Sensenich, the elevation of Dr. Ernest E. Irons to the position of President-Elect following many years of service to the organization as trustee and member of the councils, with the reelection of the Secretary, Dr. George F. Lull and the Treasurer, Dr. J. J. Moore, the Association moves on in its steady drive toward maintaining the ideals of American medicine and its system of medical practice.

Once again much of the great scope and tremendous utility of the exhibits was demonstrated. The Scientific Exhibit was larger than any previously held and its usefulness for graduate education of both general practitioners and specialists was apparent in the vast crowds of physicians who circulated through its aisles and who stood for hours listening to and watching demonstrations by men who had actually conducted the work. The motion picture show and the special conferences on diabetes, fractures and physical medicine were constantly overwhelmed with capacity attendance. The Art Show occupied a tremendous space between the Scientific and Technical Exhibits and in the interest it evolved and the attendance it attracted reached a new high point. The exhibits by medical publishers, pharmaceutic manufacturers and practically every important industry associated with the practice of medicine in the United States were larger than any ever previously held and were in their own way a graduate course in medicine.

The weather in Chicago was hot and humid and a major cause for complaint. The Board of Trustees will no doubt consider the possibility of an earlier date for any future meeting in Chicago. The next Annual Session will be held in Atlantic City, where the weather is seldom insalubrious, and thereafter in San Francisco and again in Atlantic City. The next Interim Session, which is designed to appeal primarily to general practitioners, will be held in St. Louis on November 30 and December 1 and 2 and will be preceded by a National Conference on Public Relations and a meeting by the secretaries of the state medical societies and the editors of the state medical journals.

The continued growth of the American Medical Association with its many councils, committees and bureaus, its gatherings for conferences on every aspect of medical science and practice, its extensive features in the field of publication, have demanded an addition to the present headquarters building which is now in the process of construction.

Many foreign physicians attended the Session of the American Medical Association just held in Chicago. Practically every important nation in the world was represented and there were many physicians who came from the Latin American countries, particularly Argentina, Chile and Peru, as well as from the European nations, Australia, New Zealand and South Africa. Already the interest in world medicine exemplified by the activities of the World Health Organization and the World Medical Association is growing. In this work the American Medical Association is assuming the leadership that is its responsibility because of the breadth and the high scientific quality of medicine practiced in our country.

SURGICAL TREATMENT OF CANCER OF THE RECTUM AND RECTOSIGMOID

Cancer of the rectum is an easily diagnosed lesion which when extirpated radically by surgical methods has a most favorable prognosis. While there is small difference of opinion that radical surgery is the method of choice in its treatment, the rediscovery of the "pull through operation" has in recent years created a certain amount of controversy as to the type of procedure most acceptable in the majority of cases. A cursory survey of the literature of a quarter of a century ago would have revealed to the most ardent enthusiast for the sphincter-saving type of operation a paucity of data on favorable end results of such attacks.

Certainly the milestones of progress in the treatment of cancer of the rectum and sigmoid colon, beginning as long ago as 1826 and labeled with the name of the Frenchman Lisfranc, have created an interesting vista of experience on which to look back. As one reaches the horizon of present day surgery of the lower bowel, one finally views the work of Miles as the greatest contribution in this field of surgery which has yet been made. The combined abdominoperineal resection of the rectum as developed by him has yet to be improved on by any surgeon of this day.

Since Miles's epic publication there have been innumerable surgeons both great and small who have tried to develop many procedures for the preservation of the anal sphincter in the treatment of cancer of the rectum. In the light of the recent anatomic studies carried on by David and Gilchrist and again by Coller and Ransom, there seems little justification for this effort. Furthermore, there has been to date no reported series of five to ten year cures of cancer of the rectum with preservation of the anal sphincter which can compare with the results achieved by the Miles operation.

In the light of the extensive and painstaking work of David and Gilchrist, who have studied an average of fifty-five glands per specimen in 200 resections, our routine pathologic studies in most instances seem rather inadequate. They do, however, lend additional evidence to the thesis that the presence or absence of glandular involvement exerts a profound influence on prognosis. It shows that longevity is in direct proportion to glandular involvement. This, in turn, is entirely dependent on the grade of the growth. In short, the lower the grade of the lesion, the later metastasis will occur. In contrast to this, the higher the grade, the earlier extension will take place. These observations emphasize the fundamental importance of as radical an operation as possible with as widespread a removal of gland-bearing tissue—a basic surgical principle.

The bitter cry against the abdominal anus as pointed out by Pfeiffer is raised by "those who do not have them and do not need them to remain alive." Again, he observed that "of course, the uncontrollable perineal colostomy is infinitely inferior to the abdominal anus in all respects except sentimental nonsense." With this thesis the great majority of surgeons who have had wide experience in this field are in hearty accord. By contrast one finds a few men in this country and abroad who persist in trying to stem the tide of current thought by expending great effort to maintain the anal sphincter or condone the tragic incapacity of an incompetent perineal colostomy.

The secret of proper adjustment to an abdominal colostomy is the realization that this is the safest and the best method of insuring longevity. The surgeon who is a staunch advocate of the combined operation as the best possible means for saving the life of his patient will not belie the confidence of his patient in a faltering dissertation on the pros and cons of an abdominal anus versus perineal colostomy or the doubtful possibility of retaining the use of the anal sphincter. It is this uncertainty that a colostomy is essential which leads to hesitation, dissatisfaction and maladjustment.

Current Comment

THE PRESIDENT-ELECT—DR. ERNEST EDWARD IRONS

The election of Dr. Ernest Edward Irons to be President-Elect of the American Medical Association is in accord with tradition which selects for the highest position in the affairs of the medical profession one who has for many years served his fellow physicians in a series of appointments. Dr. Irons was born in Council Bluffs, Iowa, Feb. 17, 1877. He attended the University of Chicago, receiving the Bachelor of Science degree in 1900 and the Doctor of Medicine from Rush Medical College in 1903. He was awarded the degree of Doctor of Philosophy for research in 1912. He has practiced medicine in Chicago since 1903. From 1902 to 1904 he was assistant in pathology and bacteriology at the University of Chicago, under Professor E. O. Jordan. Early in his career he became associated at the Presbyterian Hospital in Chicago with Dr. James B. Herrick and with Dr. Frank Billings; he occupied various positions on the faculty of Rush Medical College, ultimately becoming Professor of Medicine. He is now Clinical Professor Emeritus in the University of Illinois Medical School, with which Rush has been combined. In 1924 Dr. Frank Billings resigned as Dean of the faculty of Rush Medical College and was succeeded by Dr. Ernest E. Irons in the joint position of Dean of Students and Dean of the Faculty. In 1923 the Board of Trustees elected him to membership on the Council on Pharmacy and Chemistry, and he served on that council through to 1941; he has always supported the standards adopted by the scientific councils of the American Medical Association. His achievements have been recognized by membership in the Central Society for Clinical Research, the Association of American Physicians, The American College of Physicians, the American Board of Internal Medicine, the American Society for Clinical Investigation, the American Association of Pathologists and Bacteriologists and the Society of American Bacteriologists. In 1946 he was elected President of the Institute of Medicine of Chicago. He was President of the American College of Physicians in 1944 and President of the American Association for the Study and Control of Rheumatic Diseases in 1934. The Nu Sigma Nu established an annual lectureship in his honor at Rush Medical College. He himself gave the Charles R. Bardeen Memorial Lecture at the University of Wisconsin Medical School in 1940. He was President of the Society of Medical History of Chicago in 1940. He has also been awarded the "Gold-headed Cane" of the School of Medicine of the University of California, held previously by Dr. James B. Herrick, with whom also Dr. Irons has been associated through a career of many years. His contributions to medical research have been concerned with focal infection, iritis and rheumatic diseases. More recently he has written extensively in the fields of medical economics and social medicine. In World War I he became colonel in command of the Base Hospital at Camp Custer near Battle Creek, Mich., and during World War II he represented medicine in many different capacities including several important committees of the National Research Council. He is a representative of the American Medical Association in the World Medical Association. Recently Dr. Irons was appointed by Mayor Kennelley of Chicago to the Board of Directors of the Municipal Tuberculosis Sanitarium, and he is now president of that board. Doctor Irons was elected to the Board of Trustees of the American Medical Association in 1941 and has served as Secretary of the Board since that time. In 1943 the House of Delegates of the Association requested a report on hospitals practicing medicine. During the year the Board of Trustees of the American Medical Association had a conference with a committee of the American Hospital Association to consider this question. The report of that conference included studies of plans in various portions of the United States particularly as they were concerned with abuses in relation to the practice of roentgenology and clinical pathology. This report was prepared by Dr. Ernest E. Irons and Dr. R. L. Sensenich. The importance of that statement cannot be overestimated. At a meeting of the American Medical Association in 1937 the principle was adopted that the subscriber's contract under any form of hospitalization insurance should exclude all medical service and that contract provisions should be limited exclusively to hospital facilities. The report prepared by Drs. Sensenich and Irons emphasized that fundamental principle. Until it is changed by the House of Delegates, it represents the policy of the American Medical Association. Dr. Irons has been for some time chairman of the Joint Committee on Medical Activities. The Association has in Dr. Irons a representative who will be recognized throughout the world as typical of American medicine from the scientific, professional, political and social points of view.

Ernest Edward Irons, M.D.
President-Elect of the American Medical Association

DISTINGUISHED SERVICE MEDAL

Once again the Distinguished Service Medal of the American Medical Association was awarded by the House of Delegates to a Chicago physician, Dr. Isaac Arthur Abt. His accomplishments are of such magnitude as to compare well with those of the other famous American physicians on whom this distinction has been bestowed. The recipient of the first medal, Dr. Rudolph Matas of New Orleans, now 88 years old, was present when the medal was conferred by President R. L. Sensenich on Dr. Abt. Dr. Abt was born in Wilmington, Ill., Dec. 18, 1867. After a preliminary medical course at Johns Hopkins University in 1889, he received his degree of Doctor of Medicine in 1891 from Chicago Medical College, now Northwestern University Medical School. He was thereafter an intern in Michael Reese Hospital from 1891 to 1893 and subsequently did graduate work in Vienna and Berlin. He served as professor of diseases of children in Northwestern University Woman's Medical School from 1897 to 1901 and as professor of diseases of children in Rush Medical College, 1902 to 1908. He then became professor of diseases of children at Northwestern University Medical School from 1909 until 1942, since which time he has been professor emeritus. His work included consulting positions in the Children's Memorial Hospital, the Sarah Morris Hospital, St. Luke's Hospital and Passavant Hospital. He held the presidency of the American Pediatric Society in 1926 and the American Academy of Pediatrics in 1930. He was president of the Chicago Medical Society in 1927 and of the American Association of Teachers of Diseases of Children in 1922. Dr. Abt has been known not only as an outstanding clinician but also as a great teacher. His contributions to the literature of his specialty include hundreds of articles and periodicals, a baby book called "The Baby's Food," published in 1917, and an autobiography called "The Baby Doctor" published in 1944. Outstanding was his "System of Pediatrics," an encyclopedic work of which he was editor. He was instrumental in 1910 in encouraging the founding of the *American Journal of Diseases of Children.* In the American Medical Association Dr. Abt served for many years, representing the Section on Diseases of Children in the House of Delegates. His contributions on reference committees of the House of Delegates were notable. In 1925 he presented to the House of Delegates a report on the methods of sale and promotion of proprietary infant foods which has served as a standard since that time. Thus the House of Delegates honored a true physician who combines in one personality the healer, the scientific diagnostician, the teacher, the leader and the citizen.

Isaac Arthur Abt, M.D.
Awarded Distinguished Service Medal

ORGANOMERCURIAL ANTISEPTICS

The Council on Pharmacy and Chemistry recently published a report by Morton, North and Engley [1] that showed, according to the methods employed by these investigators, that commonly used mercurial antiseptics did not kill certain strains of virulent hemolytic streptococci *in vivo.* In presenting this report the Council said "The field of usefulness of organic mercurials should be explored, proved and defined. The proponents of these preparations should proceed seriously and diligently to this task." With commendable promptness the proponents of two brands of mercurial antiseptics have provided the Council with data from their laboratories. These reports, elsewhere in this issue, extend the observations of Morton, North and Engley. Although not all organisms are killed by mercurial antiseptics, virulence may be altered and the degree of infectivity lessened or practically abolished. It is gratifying that the challenge of the Council has been met so promptly. These reports help materially to define the field of usefulness and limitations of the organic mercurial compounds, and they further emphasize the need for critical appraisal of the methods used to assess the efficiency of antiseptics. The lesson to be learned from the data presented in the report of Morton and associates and in the reports of Brewer [2] and Powell [3] is that slight variations in technic, differences in test organisms, and differences in criteria of effectiveness lead to different conclusions regarding the antiseptic efficiency of the organomercurial compounds.

ORGANIZATION SECTION

PROCEEDINGS OF THE CHICAGO SESSION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN CHICAGO, JUNE 21-25, 1948

HOUSE OF DELEGATES

First Meeting—Monday Morning, June 21

The House of Delegates convened in the Red Lacquer Room of the Palmer House, Chicago, and was called to order at 10:10 a. m. by the Speaker, Dr. R. W. Fouts.

Preliminary Report of the Reference Committee on Credentials

The Speaker appointed as tellers Dr. John W. Green, California, Chairman; Dr. E. Roger Samuel, Pennsylvania, and Dr. Scott Lord Smith, New York.

Dr. G. Henry Mundt, Chairman, stated that 160 delegates had registered and the Speaker, after requesting the tellers to prepare to distribute the ballots for the selection of the recipient of the Distinguished Service Award, declared the House duly constituted.

Roll Call

The Secretary called the roll at the request of the Speaker, and 165 delegates answered or after the call reported themselves as present.

Distinguished Service Award

Dr. E. L. Henderson, Chairman of the Board of Trustees, presented a report of the Board as follows:

The Committee on Distinguished Service Award of the American Medical Association submitted five names to the Board of Trustees.

In accordance with chapter VI, section 5, of the By-Laws, the Board has selected by ballot the following names for presentation to the House of Delegates in alphabetical order: Dr. Isaac Abt, Chicago; Dr. Alfred Blalock, Baltimore, and Dr. Seale Harris, Birmingham, Ala. Dr. Henderson, on request, read to the House information from "Who's Who" concerning Drs. Abt, Blalock and Harris.

The tellers spread the ballot and the Secretary announced that one hundred and fifty-nine votes had been cast, of which Dr. Abt received ninety-nine, Dr. Blalock twenty-six and Dr. Harris thirty-four.

The Speaker declared Dr. Isaac Abt, Chicago, who had received the majority of the votes cast, to be elected by the House of Delegates to receive the Distinguished Service Award of the American Medical Association.

Adoption of Proceedings of Interim Session in Cleveland, January 1948

On motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, the proceedings of the interim session of the House of Delegates held in January 1948 were adopted as printed.

Address of Speaker, Dr. R. W. Fouts

The Vice Speaker, Dr. F. F. Borzell, Pennsylvania, presided while the Speaker of the House read his address, which was referred to the Reference Committee on Reports of Officers and which reads as follows:

Mr. Speaker, Members of the House of Delegates and Guests:

It is again my privilege to preside over the deliberations of an organization of distinguished men who have played and are continuing to play a significant part in shaping the destinies not only of medicine, but of many social activities throughout the world. Your contributions toward establishing policies for the American Medical Association have not only served this nation well, but have also provided a pattern for other organizations throughout the world. The leadership of American physicians in world organizations is quite significant. While these contributions cannot be measured by any known standards of values, they deserve the plaudits of thinking people.

As stated in some previous addresses, your Speaker believes that the function of his office is to assist in the conduct of the business of the House in a fair, unbiased and business-like manner at all times and to maintain the dignity becoming this distinguished office. This I have attempted to do. If at any time it has seemed that this was not the case, the error was due to oversight or lack of information rather than desire.

Some changes in the conduct of the affairs of the House that have been inaugurated the past few years appear to be working well and have served to expedite the business of our sessions. Some of these have already been incorporated in our Constitution and By-Laws and others will be proposed for adoption at this session. Some of the changes proposed at the interim session in Cleveland by the Special Committee to Expedite the Work of the House of Delegates will be in evidence at this session.

A resolution adopted at the Cleveland session in January provided that all reference committees be appointed sixty days prior to the convening of sessions and that the names of the appointees be published thirty days prior to the session. This poses somewhat of a problem for your Speaker. Sixty days ago, inquiry revealed that a number of the states had reported no delegates elected, and many others had reported only half of their quota. You will note from your Handbook that some states were unable to name their delegates at the time the Handbook went to press.

This condition made it impossible to give proper representation in the appointment of reference committees for this session. I do not see how this can be avoided in the future unless all state organizations revise their constitutions and by-laws and the respective delegates assume office on the same date, such as January 1 of each year. I believe that further consideration might well be given this question.

Each session of the House presents new problems. Of special significance at this time is the Blue Cross and voluntary insurance plans, the intern situation and the nurse problem. A special committee will report on the latter question at this meeting. The proposed selective draft of physicians appears to be settled, at least temporarily. I am confident that each member of this House will give due deliberation and consideration to all questions presented.

IN MEMORIAM

Each year new names are added to what is now a rather long list of colleagues who formerly served American medicine. The Vice Speaker will read the names of those who have departed from this life since our last annual session as follows (the dates following the names indicate years of service in the House or as officers of the Association):

Edward B. Angell, New York, 1908.
Francis R. Anthony, Missouri, 1907.
William E. Bannen, Wisconsin, 1916; 1929-1936.
Rupert L. Blue, President, 1915-1916.
George V. I. Brown, Milwaukee, Section on Stomatology, 1902; 1907; 1909-1916.
Curtis F. Burnam, Maryland, 1915.
William J. Carrington, Atlantic City, N. J., Vice-President, 1942-1943.
Arthur S. Chittenden, New York, 1926.
Frederic C. Conway, New York, 1939-1940.

George H. Curfman, Colorado, 1925; 1945-1946.
John Darrington, Mississippi, 1906-1907.
William Davis, Minnesota, 1903-1904.
Charles M. DeValin, U. S. Navy, 1924.
Edward C. Ellett, Tennessee, 1914; 1925-1926.
Thomas H. Farrell, New York, 1926.
Howard B. Garner, Michigan, 1905.
Alois B. Graham, Indianapolis, Section on Gastro-Enterology and Proctology, 1920-1921.
John H. Graves, California, 1921.
John A. Hawkins, Pennsylvania, 1916.
Barney J. Hein, Ohio, 1939-1947.
Charles H. Henninger, Pennsylvania, 1941-1944.
J. Newton Hunsberger, Pennsylvania, 1923-1943.
Ernest L. Hunt, Massachusetts, 1943.
Reid Hunt, Boston, Section on Pharmacology and Therapeutics, 1911-1912.
T. Henshaw Kelly, California, 1935.
Percy T. Magan, California, 1927-1930.
Descum C. McKenney, Buffalo, N. Y., Section on Gastro-Enterology and Proctology, 1933-1935.
Samuel P. Mengel, Pennsylvania, 1924; 1929; 1931-1940.
Samuel Rush Miller, Tennessee, 1911-1912; 1916.
Fred T. Murphy, Massachusetts, 1911.
John H. Musser, Louisiana, 1928. Vice President, 1933-1934; Member, Council on Medical Education and Hospitals, 1934-1947.
J. Archer O'Reilly, St. Louis, Section on Orthopedic Surgery, 1931-1933; 1940-1947.
Julian Rawls, Virginia, 1941.
Auguste Rhu, Ohio, 1912.
Charles W. Roberts, Georgia, 1925; 1927-1928; 1932-1941. Member, Board of Trustees, 1941-1947.
George E. Shambaugh, Chicago, Section on Laryngology, Otology and Rhinology, 1916.
Frederic E. Sondern, New York, 1916-1921; 1932-1942.
Reginald J. H. Stroud, Arizona, 1919; 1930.
Holman Taylor, Texas, 1912-1914; 1920-1947; Fourth Vice President, 1917-1918; Member, Judicial Council, 1939-1942.
Clarence G. Toland, California, 1934-1935.
Gerald B. Webb, Colorado, 1920-1921.
Oliver W. Welch, Alabama, 1947.
Frederick W. Wilkerson, Alabama, 1920.
George F. Zinninger, Ohio, 1932-1933; 1937-1938.

The Speaker requested the members of the House to stand for a brief moment in silent tribute to the memory of these absentees, after which he continued reading his address.

REFERENCE COMMITTEES

Your Speaker believes that it is necessary to create three special reference committees: Executive Session, Medical Service and Prepayment Insurance, and Emergency Medical Service and requests authority to make such appointment.

On motion of Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and carried, the Speaker was given permission to appoint the three special reference committees he requested.

It has been found necessary to make some changes in committee appointments since publication. The personnel of all reference committees as appointed by the Speaker is as follows (the list includes the names of all those appointed by the Speaker at this time and later in the session):

SECTIONS AND SECTION WORK

Robertson Ward, Chairman, California.
A. S. Giordano, Indiana.
Leo G. Christian, Michigan.
Charles T. Stone, Section on Internal Medicine.
Edward L. Compere, Section on Orthopedic Surgery.

RULES AND ORDER OF BUSINESS

Herbert P. Ramsey, Chairman, District of Columbia.
Philip W. Morgan, Kansas.
James P. Wall, Mississippi.
Edward H. Weld, Illinois.
James P. Kerby, Utah.

MEDICAL EDUCATION

W. D. Stovall, Chairman, Wisconsin.
Joseph H. Howard, Connecticut.
Charles F. Strosnider, North Carolina.
J. D. McCarthy, Nebraska.
Joseph F. Londrigan, New Jersey.

LEGISLATION AND PUBLIC RELATIONS

Thomas A. McGoldrick, Chairman, New York.
George A. Unfug, Colorado.
Donald Cass, California.
Clark Bailey, Kentucky.
Charles L. Shafer, Pennsylvania.

HYGIENE AND PUBLIC HEALTH

Leland S. McKittrick, Chairman, Massachusetts.
H. Gordon MacLean, California.
James Beebe, Delaware.
Robert E. Schlueter, Missouri.
Cornelius T. Lehmann, Texas.

AMENDMENTS TO THE CONSTITUTION AND BY-LAWS

Arthur J. Bedell, Chairman, Section on Ophthalmology.
James Q. Graves, Louisiana.
William F. Costello, New Jersey.
Howard R. Dudgeon, Texas.
Theodore H. Harwood, Vermont.

REPORTS OF OFFICERS

Allen H. Bunce, Chairman, Georgia.
George W. Kosmak, New York.
Louis M. Orr II, Florida.
Walter E. Vest, West Virginia.
Roland W. Stahr, Nevada.

REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Walter P. Anderton, Chairman, New York.
Thomas A. Foster, Maine.
Warren L. Allee, Missouri.
Jesse D. Hamer, Arizona.
Herman A. Lawson, Rhode Island.

CREDENTIALS

G. Henry Mundt, Chairman, Illinois.
Carl A. Lincke, Ohio.
H. B. Everett, Tennessee.
E. P. Flood, New York.
Raymond F. Peterson, Montana.

MISCELLANEOUS BUSINESS

Edwin S. Hamilton, Chairman, Illinois.
Thomas M. Brennan, New York.
Charles R. Rountree, Oklahoma.
Claude R. Keyport, Michigan.
John H. Moore, North Dakota.

EXECUTIVE SESSION

Charles H. Phifer, Chairman, Illinois.
George Braunlich, Iowa.
A. A. Walker, Alabama.
W. A. Coventry, Minnesota.
Raymond L. Zech, Washington.
Walter F. Donaldson, Pennsylvania.
George P. Johnston, Wyoming.

MEDICAL SERVICE AND PREPAYMENT INSURANCE

Henry B. Mulholland, Virginia.
H. G. Hamer, Indiana.
Stephen E. Gavin, Wisconsin.
D. A. Rhinehart, Arkansas.
L. Howard Schriver, Ohio.

EMERGENCY MEDICAL SERVICE

George E. Armstrong, Chairman, U. S. Army.
Hugh P. Smith, South Carolina.
Wyman D. Barrett, Michigan.
Morton D. Willcutts, U. S. Navy.
George A. Woodhouse, Ohio.
Raymond M. McKeown, Oregon.

TELLERS

John W. Green, Chairman, California.
E. Roger Samuel, Pennsylvania.
Scott Lord Smith, New York.

SERGEANTS AT ARMS

J. Stanley Kenney, Chairman, New York.
Hoyt B. Woolley, Idaho.
Fred H. Muller, Illinois.

The House approved of the appointments to reference committees as made by the Speaker on motion of Dr. Mather Pfeiffenberger, Illinois, seconded by Dr. Walter E. Vest, West Virginia, and carried.

POSTLUDE

As somewhat of a postlude may I be permitted to indulge in a few additional remarks?

There has been editorial comment in some medical journals and other periodicals and some papers have been written relative to the geriatric problem as it concerns the membership of this House. A resolution seeking to remedy this alleged affliction was presented on this floor. Whether or not this question merits consideration is not for me to state, but I would point out that, after a rather long period of observation, I fail to call to mind the name of any former or present member of this body whose enthusiasm has waned or whose efficiency has become less because of his years of experience in the service he has given. This is a question that cannot be settled by this body. The authority to act is vested solely in the respective state medical associations.

Speaking from a personal standpoint, I must state that to have served continuously in the House since the 1922 Session, the last ten years as Vice Speaker and Speaker, has been a most interesting and challenging experience. To have been chosen as your presiding officer for the past five sessions has in itself been a high honor, and I sincerely appreciate that honor. I have considered this position a serious responsibility, not only to this body and American medicine, but to medicine and the welfare of humankind throughout the world. Truly, American medicine sets this pace.

To have served with an outstanding group of loyal workers, such as comprise the membership of this House and the officers of the American Medical Association over these years, is a privilege that can be accorded only a few. I have been signally honored in this regard. It has seemed to me that all too few of the rank and file members of our profession interest themselves in the future of the welfare of their profession and only a comparative few carry the load.

It is not my purpose here to inveigh against the free riders who profit but do not serve, or even those who ride and drag their feet—for we have our share of them—but it is my hope that in the future more of our members will join in carrying the load, to the everlasting glory of American medicine. The members of this House should be diligent, in season and out of season, in stimulating the interest of greater numbers of our profession to combat the economic and political implications of these times.

Our obligations are not discharged by just attending the sessions of this House and participating in its deliberations. The greatest service to American medicine, its purposes and ideals, may be rendered only by taking advantage of every opportunity to inform correctly our state association members on matters of national import as they develop in connection with our official duties. This can only mean that we must take time from our professional duties to study the economic and social aspects of the problems confronting our nation at this time. I bespeak your continuous participation.

Greeting to Dr. Olin West, Former Secretary

The Speaker resumed the chair and requested Dr. Olin West, former Secretary, to come to the platform. Dr. West was greeted with enthusiasm by the members of the House.

Address of President

The Speaker declared the next order of business to be the address of President Edward L. Bortz.

Dr. Bortz delivered the following address, which was referred to the Reference Committee on Reports of Officers:

Mr. Speaker and Members of the House of Delegates:

The Centennial Celebration of the American Medical Association held one year ago created an opportunity to survey the major accomplishments and review the objectives of our Association. The first year of the second century has been characterized by vigorous activity on the part of the officials and staff of our Association, working in collaboration with officers of state and county medical societies and other groups to solve the medical problems facing the American public at the present time.

It is unnecessary to comment on the excellent state of the health of the nation, but let me briefly recall the steady advances of medical science in its various fields to extend the frontiers of knowledge which will lead to an even better control of the major afflictions of mankind. There is abundant evidence to certify the deep interest of the members of the profession in the details of medical practice. The broader social objectives of modern society are likewise under study.

THE AMERICAN MEDICAL ASSOCIATION IN ACTION

One is continually impressed and sometimes amazed at the vast amount of work which is being carried on by the members of the Board of Trustees. Their high sense of responsibility and steadfast devotion on the highest plane has placed the entire Association in their debt. Let me assure you that the weighty problems continually arising are being surveyed from every possible angle. The sole desideratum on which each problem is approached is that of a high quality of medical care for the American people. Our Board is no rubber stamp for any individual or minority pressure group. American medicine owes it a debt which will be difficult to repay.

To the Secretary, Dr. George F. Lull, and his able corps of assistants, the thanks of the Association are in order. To the Editor, Dr. Morris Fishbein, honor and credit are due for the wide extent of his interests and travels. Members of the central staff of the Association, a splendid group of workers, also deserve our gratitude.

I regret that time is not available to review adequately the great amount of significant work which is continuously being carried on by the various Councils. Each of these has a staff that has contributed in many important ways to further the cause of American medicine.

The Board of Trustees, through the Washington office and the Bureau of Legal Medicine and Legislation, is keeping strict watch on the various bills in Congress which bear on the nation's health. Only after critical analysis and a study of the ultimate ends to be served does the Board place its seal of approval. Our Board likewise has been diligent in its appraisal of innumerable plans for extending the insurance principle for financing medical care.

Our officers are playing a dominant role in the direction of the World Medical Association; we have always been in favor of the World Health Organization. Not only has the Association demonstrated its interest in international problems, but on the home front it is taking an active part in the formulation of a program for a higher level of health for our own population.

MEDICAL ECONOMICS

Many regional conferences have been held under the auspices of the Council on Medical Service. To these meetings representatives from a number of states have convened for the purpose of investigating problems of particular importance in each section of the nation. In this way, local questions are approached in a more intimate fashion. With the assistance of officials from American Medical Association headquarters, local officers have been able to clarify many of the vexing problems which are confronting the profession. Plans for medical care should be regarded as in an evolutionary phase. This must not be forgotten. A certain amount of time will be required to work out satisfactory principles. And, furthermore, it must be remembered that a program which would meet the requirements of a rural community would most likely not be applicable to densely populated areas.

Voluntary insurance plans have been surprisingly successful in winning the support of the American public. It would seem that the voluntary principle of medical insurance has won such widespread approval as to warrant universal participation in this program.

A study of medical service areas by Frank D. Dickinson, Ph.D., Director of the Bureau of Medical Economic Research, bids fair to be one of the great contributions in the field of medical economics. An analysis of the over-all medical needs of a given area compared with the personnel available is a method so sound and so logical that it is surprising that this approach has not heretofore been recognized. Such an analysis, carried on with attention to facts, should eliminate much of the controversy which has arisen because of inadequate statistical data or improper conclusions. Statistics, to have any value, must be factual as to origins and conclusions. During the coming months, a large mass of statistical data will be collected and studied. A milestone in the search for better ways of distributing medical care, and the means of payment therefor, will be reached if representatives of organized medicine and the governmental agencies working together may analyze the material and agree on the observations.

Organized medicine has never failed to support any method which logically pointed toward a higher level of health for the American people. Far from being reactionary in attitude, the past history of this Association indicates a spirit, interest and aggressiveness in the search for better medical care. Medicine, as a profession, is socially minded in action and outlook. The effectiveness of its activities may be found in the simple yardstick of the life span. Since the turn of the century, medical science has brought about an increase in the length of human life to an all time high of sixty-seven years. The monetary benefits to the consumers, since we are consumer-minded these days, are beyond calculation.

A few months ago, in February to be exact, the Brookings Institution, at the request of H. Alexander Smith, chairman of the Subcommittee on Health of the Senate Committee on Labor and Public Welfare, made an unbiased study of medical care. The report indicates that greater progress in the application of medical and sanitary science has been made under the voluntary system of medical care in our nation than can be found anywhere else in the world. And, the report continues, there is every reason to believe that these trends will carry on unabated under our present system. Certainly there is still much to be accomplished, but, as the Brookings Institution points out, it is highly probable that the intelligent cooperation of consumers and the medical profession will develop satisfactory arrangements for medical care which will remain subject to local control without administration by the national government.

During the past year the Committee on Nursing Problems, under the chairmanship of Dr. Thomas P. Murdock, has carried on a number of far reaching investigations in this important field. The numerous conferences with representatives of nursing organizations have been productive. It is to be hoped that a more satisfactory nursing program may be evolved from the work of this Committee.

HEALTH EDUCATION

Organized medicine has long been interested in the philosophy of health. However, being so preoccupied with strictly scientific pursuits, the rank and file of the medical profession has failed to use its influence and participate actively in health educational programs. Health is not exclusively a matter of medical care. Environmental factors, which include food, shelter, type of work and similar activities, are of basic importance.

A modern health program requires the participation of leaders from all walks of life in each locality. Because of their professional experience and training in the field of health and scientific medicine, members of the medical profession should assume leadership in the formulation of a satisfactory health program in every community. With emphasis on prevention, prophylaxis and the maintenance of vigorous positive health, fewer patients should require hospital care and the level of health should be improved. Likewise, the costs should decline.

During the past year a number of important conferences have been arranged by the Bureau of Health Education of the Association. To these conferences have come educational and other civic leaders for the purpose of exploring ways and means for more satisfactory health educational programs. We are well on our way in the field of health education.

PREPAREDNESS

At the present time, the Congress of the United States has a number of bills in process bearing on the problem of medical care in the event of national emergency. Discriminatory legislation for drafting physicians has been vigorously opposed by the American Medical Association. Such legislation is unconstitutional and could not be sustained in court. Organized medicine is obligated to aid in the development of an over-all program which will adequately meet the needs of the entire population. The difficulty in drafting physician's and in placing the destiny of members of the medical profession in the hands of military authorities would bring a decided deficit of personnel to care for civilian requirements.

Last Saturday the Congress passed the draft. Congress, in deference to American medicine, deleted that objectionable item from the draft bill, and now where do we stand? That is one of the most important problems facing this House today. Gentlemen, Congress has deleted that section of the bill and the draft is coming on in ninety days, and the Medical Corps of the armed forces is going to need doctors. That is our responsibility. I want to say to you that we have had wholesome and sustained cooperation from the Surgeons General and their staffs all along the line. They have cooperated with the Board of Trustees and officials of the Association at all times. They have cooperated with our Council on National Emergency Medical Service, and now we must rise to the occasion and see that sufficient doctors are available on a voluntary basis. The alternative, gentlemen, is the draft.

The Council on National Emergency Medical Service, created by this House during the past year, under the able Chairman, Dr. James C. Sargent, has held a number of conferences with top ranking authorities in Washington. At these meetings the various phases of medical care in the event of national involvement have been discussed. It would seem that an Advisory Medical Board should be established to function with the National Security Resources Board at the top civilian level. Only on this plane will it be possible to determine the over-all needs of the nation and to make assignments accordingly. Past experience has demonstrated the vast amount of waste in personnel and equipment which occurs when nonmedical officials are given responsibility for allotment of medical resources. Hard-won experience should not be disregarded in the present hour of national concern.

Through the Council on National Emergency Medical Service we are well prepared to render a valuable service to the nation.

MEDICINE'S SOCIAL RELATIONSHIPS

The subject of public relations has received a great deal of attention during the past few years. The field is a broad one. Essentially it deals with human relationships, and the aim to be accomplished is a sympathetic understanding of the manifold activities which are being carried on by the medical profession. Preoccupation with restricted professional phases of practice with too little attention to the interpretation of the work we are carrying on has left large segments of the public uninformed about the objectives we are seeking to attain. To bring about a better rapport between the public and the profession, it is essential that we utilize every avenue of approach—every means for dissemination of information.

Members of the profession are being subjected to much adverse criticism because of the inability on the part of the public to obtain the services of a physician for night emergencies. Here is one problem that must be solved and solved promptly by physicians throughout the nation. County medical societies are in a position to improve the public relations of our profession at the local level by developing methods for taking care of night calls.

In the field of human relationship the Woman's Auxiliary is our most valuable asset. The response with which the splendid women have carried the message of American medicine into the various forums, clubs, associations and councils of lay groups is an important service to the country.

Press releases and other promotional work of similar nature in which Mr. Lawrence Rember and Mr. John Bach are engaged have kept the activities of the Association before the public. Accuracy and dignity in reporting the work of medical science has reached a new high during the past year, and medicine has won new adherents through the activities of these men.

From time to time it should prove edifying to survey the position of organized medicine in various areas of the nation. What is the present status of the relationship between Congress and the American Medical Association? How does organized medicine stand with the manufacturing groups, with labor and with educational institutions? Where lack of understanding exists, it is our responsibility to analyze the specific complaints and in a generous spirit endeavor to rationalize the differences.

A resourceful public relations program will reveal these troublesome issues and institute effective measures for their correction.

MEDICINE IN A FREE SOCIETY

In the past organized medicine has concerned itself principally with standards of education, extension of services and the promotion of research. The changing scene of civilization is bringing the people of various nations into closer contact and communication with one another. Isolationism is an outworn concept. Health is a topic of major interest which is international in scope.

In our favored land, leadership in medicine is essential if the full potentialities of modern medical science are to be realized. The scientific method in medicine has infinite possibilities for improving human beings. In fact, as Descartes many years ago stated, "If the human race is ever to improve materially, intellectually, and culturally, the science of medicine will perform that service."

The troubled world today is hoping for social stability. Citizens of all nations are longing to return to peaceful pursuits without the ominous threat of human destruction. It should not be necessary to descend to the barbarous rule of the jungle in quest of a better way of life. The members of the medical profession, schooled in the intricacies of the management of disease, also possess an insight into the inner emotional mechanisms of their fellow human beings. The physician intimately knows the hopes and fears and aspirations of those whom he serves. The man of medicine is a friend and counselor of his patients. In this sympathetic relationship he is a leader in his community. An organization of such leaders possesses the capacity, and has an unexcelled opportunity, to influence social trends in the direction of a higher level of health for community and nation.

In the atomic age, when a new chapter of civilization is being born, the medical profession should rise to its full stature and exert its powerful influence in the formulation of a social program that will extend the benefits of medical science to the far corners of the world.

During the past year the American Medical Association has made an auspicious beginning in its second century. There is need for broad vision and the long view in planning a program for the future in order that our Association may maintain its position as a great organization dedicated to the lofty principle of a more worth while way of life for our fellow men.

Presentation of President-Elect

The Speaker presented to the House Dr. R. L. Sensenich, the President-Elect, who addressed the House as follows:

Mr. Speaker, Mr. President, Dr. West, Members of the House:

It is a bit difficult to take all these evidences of your kindly interest and your evident kindly feeling toward me and such respect as you have for the office of President-Elect of the Association.

Last year I made a suggestion that I thought the President-Elect probably should not take your time in addressing you, and a little later the committee formulated this matter into a rule. Now perhaps I might admit that maybe I suspected they were going to do that. At any rate, I am not going to take your time today.

I reminded the House at that time that you had much to do, much of importance. If I judge correctly, you have more to do this year, and I regret that in the future I can see no opportunity for relief. If medicine is going to continue to hold and to assume still further positions in leadership in those things in which medicine should be interested, yours will be the task of defining the policies, and those policies are sometimes not easy to define, a bit difficult to follow, in the midst of a social structure that sometimes is not kind to our point of view.

And, lastly, it needs a unanimous opinion and a definite willingness to get down and fight for the promotion of those policies. I am not going to take any of your time, but I wish to assure you, I hope and believe you have always felt, that I shall do, so far as it is humanly possible for me to do, the utmost in carrying out the policies that you define during my term of office.

Reports of Officers

REPORT OF BOARD OF TRUSTEES

Dr. E. L. Henderson, Chairman, presented the Report of the Board of Trustees as printed in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary, with the exception of the Report of the Council on National Emergency Medical Service, which was referred to the Reference Committee on Emergency Medical Service; the Report of the Committee on Rural Medical Service, which was referred to the Reference Committee on Medical Service and Prepayment Insurance, and the Statement on the National Need for Blood Transfusion, which was referred to the Reference Committee on Executive Session but later was taken from that Committee and referred to the Reference Committee on Miscellaneous Business. The mimeographed copy of the supplementary Report of the Council on National Emergency Medical Service, distributed with the Handbook was referred to the Reference Committee on Executive Session

SUPPLEMENTARY REPORT OF BOARD OF TRUSTEES

Cooperation with the Secretary of the Interior

Dr. E. L. Henderson, Chairman, presented the following report, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

By invitation from the Secretary of the Interior, the Honorable J. A. Krug, the executive committee of the Board of Trustees and certain officers of the American Medical Association became an advisory committee to the Secretary and have been associated with him in the sending of teams of physicians to study health conditions in outlying portions of the United States Government, to give aid to physicians to improve quality of medical care to the indigent. During the latter half of 1947 and the first half of 1948 groups of physicians visited the Navajo Indians; also Alaska, Puerto Rico and the Virgin Islands.

The group to Alaska included clinicians from the staff of the Cook County Hospital in Chicago. Their report on medical conditions in Alaska was published in The Journal for Oct. 25, 1947. Favorable comment concerning their visit came from leading physicans and surgeons in Alaska, from the Commissioner of Health, from the government of Alaska and also from the medical society. So favorably was their visit considered that another group will be sent to Alaska during the latter half of 1948.

A team developed from Southwestern Medical College and Foundation in Dallas, including six physicians from Texas, visited the Navajo Indians. The report of their visit is published in The Journal for Dec. 13, 1947, page 981.

A medical mission under the leadership of Dr. Ernest E. Irons, Secretary of the Board of Trustees, visited Puerto Rico and the Virgin Islands. Their report was published in The Journal for April 10, 1948, page 979. Approval of this visit has come from the Government of Puerto Rico, and the medical society of Puerto Rico has specifically requested another group during the coming winter.

This cooperation with the Secretary of the Interior has been especially important in presenting to the Congress of the United States the medical conditions under these portions of the United States Government. A special request has come to visit the Indians in the Northwest, and a group is now being formed under the leadership of Dr. William F. Braasch to visit the Northwest Indians during the coming summer.

The Board of Trustees invites attention to the fact that this movement was stimulated through the office of the Secretary of the Interior, the Honorable J. A. Krug, that he requested as his advisory group the executive committee of the Board of Trustees of the American Medical Association and its officers and that the activities met with the complete approval of every one concerned.

This activity is reported to the House of Delegates for its consideration and for such recognition as it may wish to give.

World Medical Association

Dr. Henderson presented the following report, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

Since the last report on the World Medical Association was made to the House of Delegates in January, the Council of that Association has met in New York. The Council approved the selection of the location of the headquarters and secretariat at the New York Academy of Medicine, where suitable space has been obtained.

The Council elected Dr. Louis H. Bauer as Secretary-General, and he consented to serve on a part time basis. On his election as Secretary-General, he resigned from the Council of the World Medical Association and was replaced by Dr. E. L. Henderson.

The next meeting of the General Assembly was transferred from Prague, Czechoslovakia, to Geneva, Switzerland, and will be held Sept. 8-11, 1948. The Board of Trustees has designated Drs. E. L. Henderson and R. L. Sensenich as Delegates, Drs. E. E. Irons and Morris Fishbein as Alternate Delegates, and Dr. W. F. Braasch as observer, for this coming session.

Among the matters being considered and studied by the World Medical Association are the status of the physician; the standards of medical education; the methods of rating specialists; fraudulent advertising, and cult practice. It also is studying war crimes and the best methods of preventing recurrences; displaced physicians; graduate medical education; the various programs of social security, and the preparation of an international code of ethics.

It is hoped that a bulletin will be issued before the meeting of the next General Assembly. At that time plans will be adopted for a bulletin to be issued at regular intervals.

Also at the time of the meeting of the General Assembly there will be a meeting of the medical editors of the world. This meeting is being sponsored by the World Medical Association.

On a recent visit of the Council to the United States, the members were entertained in New York, Chicago, Minneapolis and the Mayo Clinic. It is believed that they acquired a good knowledge of how medicine is practiced in the United States and that a spirit of international understanding and good will was fostered.

As has been previously reported to you, the United States Committee is responsible for the entire cost of the upkeep of the secretariat and traveling expenses of the Council. This is necessary because of the financial condition of some national associations and the difficulty in transferring funds from one country to another. The funds of this committee are being raised by voluntary subscription from individual physicians, medical organizations, organizations allied to and serving medicine and other individuals and organizations.

All founder-sustaining members of the United States Committee will receive the bulletin of the World Medical Association and thus be kept informed of its activities.

To play a part in raising the standards of medicine and health throughout the world and to promote better international relations and world peace are certainly worth while and an aim to which we should all aspire. The Board of Trustees urges the support of the United States Committee by individual physicians and other medical organizations. No effort is too great to support the objectives of the World Medical Association.

Revision of National Health Program

Dr. Henderson presented the following report, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

The Board of Trustees has given consideration to the National Health Program of the Association and recommends revision of point 7, "Veterans' Needs for Hospital and Medical Care," which now reads:

> A program for national health should include the administration of medical care, including hospitalization, to all veterans, such medical care to be provided preferably by a physician of the veteran's choice, with payment by the Veterans Administration through a plan mutually agreed on between the state medical association and the Veterans Administration.

The revision suggested is:

> The veterans shall be entitled to the highest available quality of medical care, in accordance with existing law, and preferably in his home community with a physician and hospital of his own choice.

Reports of Committee to Study Conditions of General Practice and Committee on Nursing Problems

Dr. Henderson presented the following reports of the committee to Study Conditions of General Practice and the Committee on Nursing Problems, mimeographed copies of which had been handed each delegate as he registered; these were referred by the Speaker to the Reference Committee on Medical Service and Prepayment Insurance.

REPORT OF COMMITTEE TO STUDY CONDITIONS OF GENERAL PRACTICE

The House of Delegates at the Atlantic City Session in June 1947 approved the recommendation of the President, Dr. H. H. Shoulders, that the Board of Trustees appoint a special committee which could "(1) define the term 'general practitioner,' or 'general physician,' on a functional basis; (2) determine whether or not there is need for a large increase in the number of medical graduates and, if so, its extent; (3) study the present program of medical education and training, both undergraduate and postgraduate, to determine whether or not the content and administration of the program is properly adjusted to the present day needs of the people; (4) study the possibility and feasibility of utilizing smaller community hospitals in a program for the training of general practitioners and the possibility of approving such institutions for such training when a teaching program is properly organized and administered; (5) study the means by which communities in need of additional services may be aided; (6) study such other questions as the committee itself may determine to be necessary in arriving at sound conclusions concerning the entire field of medicine, and (7) propose a long range program designed to overcome present insufficiencies and to meet future needs."

In accordance with the action of the House of Delegates, the Board of Trustees appointed the Committee to Study Conditions of General Practice. The Committee has given careful consideration to the suggestions for its work which were outlined in President Shoulders recommendation and at this time submits the following report with respect to those seven proposals:

"(1) Define the term 'general practitioner.'"

A general practitioner is a legally qualified Doctor of Medicine who does not limit his practice to a particular field of medicine or surgery.

"(2) Determine whether or not there is need for a large increase in the number of medical graduates and, if so, its extent."

It is recommended that this matter be referred to the Council on Medical Education and Hospitals and the Bureau of Medical Economic Research, since both the Council and the Bureau already have accumulated considerable data regarding it.

"(3) Study the present program of medical education and training, both undergraduate and postgraduate, to determine whether or not the content and administration of the program is properly adjusted to the present day needs of the people."

The Committee commends the approved medical schools of this country for their interest in broadening the curriculum to prepare medical students for general practice. It encourages them to continue and to place increasing emphasis on postgraduate training with a view to establishing courses of at least two years of training which will fit the graduate for entering general practice. It also commends the American Board of Internal Medicine for broadening the opportunities for admission to its examinations, and recommends that similar action be taken by other specialty boards.

The Committee also recommends that every general hospital be organized so as to give the general practitioners adequate staff privileges and representation.

"(4) Study the possibility and feasibility of utilizing smaller community hospitals in a program for the training of general practitioners and the possibility of approving such institutions for such training when a teaching program is properly organized and administered."

The Committee is agreed that the smaller community hospitals not directly associated with medical schools, if properly supervised, would be excellent training institutions for general practitioners. It recommends that the Council on Medical Education and Hospitals proceed with the development of such a program.

"(5) Study the means by which communities in need of additional services may be aided."

In view of the fact that many studies are being carried on by agencies of the American Medical Association as well as by state agencies, the Committee believes that these activities should be continued by those agencies. The essential responsibility of each community for developing its own facilities, social and educational as well as medical, is recognized by students in this field. The Committee believes that the organization of integrated hospital facilities based on trade areas and population needs is essential to the development of good community medical service. It also recognizes that financial and technical aid is necessary in certain areas. This should be provided in such a way as to meet essential needs and preserve community control.

"(6) Study such other questions as the committee itself may determine to be necessary in arriving at sound conclusions concerning the entire field of medicine."

It is the opinion of the Committee that the American Medical Association should be the evaluating agent in the following fields: (1) medical education; (2) hospital standardization; (3) intern training, and (4) residency training. It is also the opinion of the Committee that there should be the closest possible liaison between the various American specialty boards and the American Medical Association. No other medical society or organization, as such, should be represented in this work.

The Committee is further of the opinion that courses in the basic sciences at the postgraduate level should be so coordinated that, while supplementing, they will not interfere with the program of training in clinical subjects.

The Committee believes that the hospital staff should be the sole deciding body as to who may practice medicine in the hospital either as a staff member or as having hospital privileges, since the certifying boards pass only on the ability of a man to perform work in his specialty.

The Committee also believes that the general practitioner does not show adequate interest in organized medicine, local, state or national, and that he should be urged to participate in all activities of organized medicine, both scientific and organizational.

"(7) Propose a long range program designed to overcome present insufficiencies and to meet future needs."

It is the feeling of the Committee that it is impossible rationally to formulate any long range program designed to overcome present insufficiencies and to meet future needs, unless this or a similar committee be continued to consider various phases of these problems as they may arise.

Respectfully submitted,

Karl A. Meyer, Chairman.
Paul A. Davis.
Reginald Fitz.
Winfred B. Harm.
Paul B. Magnuson.
Walter B. Martin.
Stanley R. Truman.

REPORT OF COMMITTEE ON NURSING PROBLEMS

Following the vote of the House of Delegates at the Annual Session in Atlantic City, Dr. E. L. Bortz, the President of the American Medical Association, appointed a committee of five to study the nursing problem in the United States. The members of the committee are Drs. Warren F. Draper, Howard K. Gray, Leland S. McKittrick, Donald W. Smelzer and Thomas P. Murdock. The Committee made a report of progress at the Interim Session in Cleveland in January 1948.

Your committee has gone into the matter exhaustively and has explored all of the available sources of information. During the course of the study, conferences have been held with representatives of the American Hospital Association, the American College of Physicians, the American College of Surgeons, the American Nurses Association and various other nurses' organizations.

We estimate that about 400,000 nurses will be required to care properly for the American people in 1949. This estimate is based on figures obtained from "Facts About Nursing, 1946 and 1947," and from the report of the President's Commission on Higher Education.

In 1940, 38,000 students were admitted to training schools; in 1941, 41,397; in 1942, 47,500; in 1943, 53,074; in 1944, 67,051; in 1945, 57,000, and in 1946, 30,899. It will be seen from this that during the period of the nurse cadet program the number was at an all time high. Immediately after the war was over the number dropped about 50 per cent. This may be explained on the basis of patriotism or stipend—probably the former.

It is estimated that there are about 342,737 nurses now available. A bulletin issued by the Women's Bureau of the U. S. Department of Labor indicates that 550,000 nurses will be required to care for the American people in 1960 if current standards of nursing are maintained. It also states that to accomplish this 50,000 nurses must be graduated each year from 1951 to 1960. The largest number ever graduated was 44,700 in 1947. This was the graduating class that entered training schools in 1944 with an admission number of 67,051. The report of the Bureau further states that "this is a realistic appraisal of possible attainment in a given period rather than what is ideally desirable." To obtain what is described as "ideally desirable" would require twice this number. These are staggering and alarming figures and tell American medicine a story of what is before it in the years to come.

There is one ray of hope before the committee. A questionnaire was sent, by the American Hospital Association, to 3,800 member hospitals in 1947. Two thousand, three hundred and seventy-six replied. Thirty-seven per cent of these replied that they did not need more nurses. The New England area was in greatest need.

The committee has studied the problem under three headings: (1) immediate relief, (2) proposed training for all grades of nurses in the future, and (3) the economic situation.

1. Regarding the first it has recommended that retired nurses, including married nurses, be requested to fill in during the emergency. Through the efforts of Dr. W. W. Bauer and with the generous cooperation of the National Broadcasting Company and the Advertising Council, a great deal of publicity has been given this subject. Many editorials have appeared in *Hygeia* and state and county medical journals stimulating doctors to aid in recruitment of student nurses and urging retired nurses to return to the fold. Personnel trained on the job have been advised and used to supplement nursing services. *Trained* practical nurses under supervision are being used. Hospital administrators have been requested to use nurses only in nursing duties and to assign other work to auxiliary personnel. It is the feeling of hospital administrators and directors of nursing schools that the situation has begun to show improvement and that it is easier now to obtain nurses in various grades than it was one year ago. The Hospital Career Campaign for the recruitment of student nurses for 1948 gives promise of an increased student nurse enrollment.

2. Under the second heading, which relates to the proposed *training of all grades of nurses in the future*, your Committee is prepared to make definite and concrete recommendations. We have investigated and studied carefully the question of bedside nursing and the required training for this grade of nurse. We recommend two main classes of nurses: (*A*) professional nurses, and (*B*) *trained* practical nurses.

(*A*) *Professional Nurse.*—This group is to be subdivided into (*a*) nurse educators and (*b*) clinical nurses.

(*a*) Nurse educators are to be those with collegiate training and others who have shown an aptitude for teaching, administration and supervisory positions. These are to fill the positions of directors of nursing schools, teachers, department and clinical supervisors, public health nurses, etc. The training for these nurses should be collegiate training before entering the nursing field or combined collegiate and nursing training.

(*b*) The clinical nurse is to be comparable to the present day general duty or private duty nurse. Selected clinical nurses with an aptitude and ability for teaching may well be considered for some of the subordinate teaching positions. We recognize that there are many duties to be assigned to this grade of nurse which could not be filled by the *trained* practical nurse. We recommend that the course of training for the clinical nurse be reduced to two years.

(*B*) *The Trained Practical Nurse.*—Your committee has underscored the word *trained.* Unfortunately it seems to the committee, the term "practical nurse" bears the implication of no training. However, the term has already been written into the statutes of several states and a change of the name would be difficult. At the same time the committee feels that the name is not of major significance, but does feel, however, that it is very important that uniform standards of training and duties be established across the country. For this group your committee recommends one year of training made up of three months theoretical and nine months practical training. This can be accomplished completely in a hospital, or the three months theoretical training may be taken under a department of education and the nine months training in an acceptable hospital. Your committee feels that this group of *trained* practical nurses, under proper supervision of professional nurses and medical staff, will be able to do much of the routine bedside nursing now being done by professional nurses, but that the more delicate and intricate duties must be left to the professional nurse. We believe that sufficient bedside nursing care can be obtained economically and efficiently if the professional nursing staff is augmented by *trained* practical nurses. Provision should be made, and credits allowed, in selected cases, toward training for advancement from the grade of *trained* practical nurse to the grade of clinical nurse.

3. The last or economic problem presents certain features which should be corrected. Your committee urges that steps be taken to provide social security and retirement plans for all nurses. This is advised from the business and moral points of view. We also recommend that hospitals adopt a definite personnel policy, for all institutional nurses, with a view toward making salaries, hours, sick leave and vacations comparable to other fields of endeavor for women with equivalent education and training.

The committee recommends that the cost of essential special nursing care, to the patient, be covered by prepayment nursing plans or be tied into prepayment hospital and medical plans, if practicable.

The committee feels that the nurses innocently erred in their action in Atlantic City in 1946 when they voted to have their state organizations act as bargaining agents for them. They are members of a noble profession. They do not need bargaining agents. The term bargaining agent carries with it the implication to strike even though it is true that they have never gone on strike. Medical men, nurses, and other hospital employees have not the right to strike anywhere, any time. They are dealing with that most priceless possession—life itself. It is hoped that the nurses will correct this in the near future.

A permanent Conference Committee made up of representatives of the American Nurses Association and other nurse organizations, the American Hospital Association and the American Medical Association has been formed. The duties of this committee will be to study the problems common to all. Nursing problems are the most urgent and important at present. This committee might well be used to adjust any differences that any of the groups might have.

The committee wishes to thank Dr. E. L. Bortz, the President of the American Medical Association; Dr. Elmer Henderson and the Board of Trustees; Dr. Morris Fishbein, the Editor of The Journal, and the representatives of the American Hospital Association for their cooperation and aid in this study. The representatives of the various nurses' organizations have been very helpful to the committee. They are anxious to have this whole nursing problem solved and have cooperated fully. The committee expresses its gratitude for their aid.

And so we end, at least for the present, the study of the nursing problem and summarize it as follows:

1. It is estimated that about 400,000 nurses will be required to care for the American people in 1949. The committee feels that this can be accomplished.

2. Labor Department statistics indicate that about 550,000 nurses will be needed in 1960. To accomplish this about 50,000 nurses must be graduated each year between 1951 and 1960. This can be accomplished by the generous cooperation of all concerned.

3. The committee has proposed measures for the relief of the present situation and feels that much has been accomplished.

4. The committee recommends that changes be made in the present method of training nurses; that in the future nurses be made up of two main groups—the professional nurse and the *trained* practical nurse. The requirements, duties, and courses of training of both main groups have been outlined.

5. The economic situation has been reviewed and methods of correction suggested.

6. A permanent Conference Committee has been formed, made up of representatives of the American Nurses Association, the American Hospital Association and the American Medical Association.

7. The committee believes that this permanent Conference Committee will be the organization to implement your committee's recommendations and the recommendations that come from other interested groups.

Respectfully submitted,
Thomas P. Murdock, Chairman.
Warren F. Draper.
Howard K. Gray.
Leland S. McKittrick.
Donald W. Smelzer.

Supplementary Report of Committee on Rural Medical Service

Dr. F. S. Crockett, Indiana, presented the following supplementary report of the Committee on Rural Medical Service, which was referred to the Reference Committee on Medical Service and Prepayment Insurance:

The interest of farm people in their health problems is receiving increasingly widespread attention. In at least nineteen states, health councils on the state and community level have been organized under the stimulus and guidance of the medical profession. This cooperative activity of the medical profession with the laity in the promotion of public benefits will produce other advantages far beyond their immediate objectives.

The Board of Trustees has granted authority to this committee to employ a field secretary. The many existing organizations interested in promoting health measures need guidance in coordinating their activities in a common effort. In many states the assistance of this committee has been solicited. The members of this committee have given considerable time from their busy practices in furtherance of this objective. The demand has exceeded our limited ability. It is our hope that some one can be found able to represent us and with ample time to do a good job in portraying to our rural friends the active interest of the medical profession in the solution of their rural health problems.

The rural medical cooperative, as one form of prepaid medical care, should be organized to spread the costs of illness and hospitalization so as to prevent catastrophic, economic distress to its members. As a community effort to solve a local need without resort to governmental assistance when set up as a nonprofit insurance plan complying with the principles set down by the Council on Medical Service of the American Medical Association, it should then receive the support of the medical profession. Arrangements have been made for an early conference with representatives of the medical cooperatives to explore the possibility of mutual understanding of the problems involved. The Council on Medical Service and this committee will join in this meeting.

This committee was represented on the rural panel of the recent National Health Assembly at Washington and found opportunity to tell what the medical profession, through this committee, has accomplished in cooperation with the leaders of the major farm groups in helping our farm friends to help themselves.

F. S. Crockett, Chairman.
Norman H. Gardner.
H. B. Mulholland.

Proposed Amendment to By-Laws Re Committee on Rural Medical Service

Dr. Henderson presented the following statement regarding a proposed amendment to the By-Laws, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

The Board of Trustees feels that the Committee on Rural Medical Service is, according to the Constitution and By-Laws, and logically, a function of the Council on Medical Service. Because it is at present in the formative stage and the Board does not wish to interfere with its development, it is being continued in its present status, but its formative plans should be completed within the next year, at which time it should be incorporated in the Council.

It is suggested that the By-Laws be amended to read that in addition to the regular members there shall be one additional member,. appointed by the Board of Trustees, who shall be Chairman of the Committee on Rural Medical Service.

Dr. Henderson asked permission to present in Executive Session a Supplementary Report of the Council on National Emergency Medical Service, which was granted.

Address of Rear Admiral C. A. Swanson (MC), U.S.N.

Dr. Henderson presented Rear Admiral C. A. Swanson (MC), United States Navy, who spoke as follows:

Honorable Chairman and Fellow Delegates: The present trend of world conditions has for some time been ominous and continues so. We hope and pray for the light of reason and common sense to dissipate the miasmic clouds of doubts, dogmas and differences, dependent on divergent political ideologies among nations. Meanwhile, every intelligent and thoughtful person in this nation would, I am sure, regard as foolhardy a failure on our part to be prepared for the worst. At no time in our history could we less afford to relax vigilance. I behooves civilian and military medicine, as never before, to go forward in thorough cooperation and complete understanding of the problems peculiar to both. Your thoughtful and sustained efforts toward arriving at workable solutions to these problems in the past have been deeply appreciated. Your continued help is sincerely solicited.

Your able support toward obtaining medical components at the highest level of planning, such as the National Security Resources Board, the Research and Development Board, the

Staff of the Joint Chiefs of Staff and the Munitions Board, will enable medical personnel to be more instrumental in formulating advance plans which include the distribution of medical care, as well as more widespread indoctrination in the expected possibilities as to required preparedness, anticipated duration and expected casualties.

The advent of new and fantastically more destructive weapons of war makes it mandatory that our ever deficient wealth of medical care be apportioned most carefully and planned with every caution. The Bureau of Medicine and Surgery is in wholehearted accord with the saving of medical officer manpower by such means as delayed "call-up" until actual time of need, deletion of protracted unnecessary military indoctrination, proper classification as to specialties, reasonable rotation between combat and rear areas of duty and rigid scrutiny of any possibility of overstaffing in any theater.

We fully concur in the deferment of induction of premedical, medical and scientific students, as well as medical professors and research scientists. This Bureau is, moreover, keenly and profoundly mindful of the absolute essentiality of taking into account the need of civilians in any plan dealing with the nation's medical resources. Any program which would be deficient on this score, would be fatally deficient.

The Medical Department of the Navy, we believe, has presently established an efficient and effective medical officer training program. We have at the present time 187 interns, 288 resident physicians, 99 medical officers undergoing instruction in civilian schools and naval hospitals. In addition to these, we have 30 medical officers undergoing instruction in naval medical specialties, such as aviation medicine, tropical medicine and submarine medicine. Our operating census of medical officers, exclusive of interns, is now 2,518. With your cooperation, the progress of this program has been excellent, but, unfortunately for the medical department, too many of these medical officers return at an early date to civilian life and the process begins again. To give you an idea of the cost of this type of program, we plan to expend, in the fiscal year 1949, $250,000 for courses in civilian schools and approximately $800,000 for the employment of civilian consultants to lead the training program and maintain high professional standards.

There are other facets to our problems which I desire to mention. Medical officers in the Navy are all too frequently considered numerically in relation to active duty personnel, whereas the medical department has many responsibilities not always related directly to active duty strength. Our medical officers afford a considerable measure of medical care to the dependents of service personnel, which number approximately 500,000. To visualize the portion of medical care that is afforded to these dependents, we now furnish about 1,250,000 office calls per year, with 40,000 home visits, 55,000 hospital admissions and 22,000 deliveries per year. We also afford care to approximately 50,000 fleet reserve and retired personnel. We furnish industrial medical care, plus treatment of emergency illnesses to about 340,000 civilian employees of the Naval Establishment. We have an average of approximately 4,000 Veterans Administration beneficiaries in our naval hospitals. We operate an outpatient clinic in Philadelphia for the Veterans Administration, affording about 125,000 treatments per year. The island natives of the Pacific Trust Territory, numbering 100,000, are also furnished medical care by our department. There are many other minor requirements demanding personnel with medical training, such as research, preventive medicine, medical preparedness planning and training of enlisted personnel. Furthermore, the nature of the assigned duties to isolated ships and stations often requires the presence of a medical officer despite the limited service personnel on board.

During the prolonged and at times heated debate with reference to the recently enacted Draft Law, there was considerable discussion and haggling over the ratio of doctors to the personnel under their care. With the sincerest kind of respect for those who were the leading persons concerned on this score, I must say that their views were not based on a sound understanding of the premises on which our ratio is based. Neither were they aware of the fact that the formula which may be applicable to the Army is not applicable to the Navy, and why this is true. We do not claim that we have too much work to do—that we have bitten off more than we can chew. We want to do all the work that we are doing and more—and by so doing we make a better medical department. It is better for those who comprise the medical department and it is better for the personnel of the Navy and other personnel which it serves.

Gentlemen, I point out the foregoing details so that you may be more thoroughly informed of the full picture within the service. The Navy, of which I have the honor to be Surgeon General, is the nation's Navy. Those whose lot it now is to guide the destinies of the Medical Department of the Navy realize that this nation must go forward if it is to survive. There is but one alternative—that is to go backward—to decline and fall. The armed forces must go forward with the nation. What is true for a whole organization is equally true for a component part of that organization. Therefore, the medical departments of the armed forces must keep pace not only with the progress of the military or naval forces, of which they are an important part—indeed, a vitally essential part—but with civilian medicine as well. And I want to say that not only do we have a responsibility toward civilian medicine, but civilian medicine has a real and solemn responsibility toward us. The Draft Act has passed. To what extent its language will be interpreted to provide for the drafting of doctors is still a moot question. I regret that the drafting of doctors should be necessary. The thought was distasteful to many—it was distasteful to me—but as head of an organization whose paramount mission is the protection and preservation of the health and the treatment of disease and injury, of members of the Navy and Marine Corps and their dependents, I am, of course, acutely aware of the absolute necessity for an adequate number of doctors. Here is where organized civilian medicine, under the care and able leadership of the American Medical Association, comes in. If American medicine were *so organized that it could guarantee* the armed services all the doctors needed, and the collaboration of civilian and military medicine were what it should be, the drafting of doctors need never come up. I hope that American medicine and the medical departments of the armed services are so organized and that its organization and rapport are such as to make this desideratum realizable. To the end that this may be accomplished, I want humbly to ask the offices of this leading agency of American medicine to come to our aid in this our hour of desperate need.

Address of Dr. R. Scott Stevenson

Dr. Henderson presented Dr. R. Scott Stevenson, London, England, who presented the following address:

MESSAGE FROM THE BRITISH MEDICAL ASSOCIATION

I am very glad to have the privilege and pleasure of conveying to you, at the request of the British Medical Association, most friendly greetings from the profession in Britain, and of expressing the warm thanks of the British Medical Association for the encouragement which it has received from your sympathy and good wishes in its recent struggle against the threat of state domination of medicine. I believe that you share our view that the conversion of medical practitioners into a corps of salaried medical officials, employed by the State, would be against the best interests of our profession and against the best interests of all whom it is the privilege of our profession to serve. *You may therefore feel that our successful fight to prevent the new Health Service Act from being used as a means of introducing a whole time state salaried service merits your commendation and that we have gained a victory for freedom which is of importance to the profession, not only in Britain, but wherever freedom is prized.* We have certainly been able to provide an interesting demonstration of the power of a *united* profession to force a change of mind in the most obstinate and bellicose of politicians.

In Britain we are short of professional personnel, buildings and equipment, and many years must pass before our new health service can become fully effective. You will no doubt watch its development with keen interest. The active participation of your Association in the proceedings of the World Medical Association is a source of great satisfaction to us in Britain, and we hope that both medical science and medical administration may benefit from ever closer ties between the doctors of our two countries.

I bring you from the British Medical Association most cordial wishes for the success of your present deliberations and for the continued prosperity of the American Medical Association in the years to come.

Address of Dr. H. B. Washburn, St. Paul

Dr. Henderson presented Dr. H. B. Washburn, St. Paul, President of the American Dental Association, who addressed the House as follows:

MUTUAL COOPERATION

American Dental Association Officially Opposed to Undesirable Federal Programs Just as Much as Is the American Medical Association

Our program of approach is based on policy of having ready, when we oppose, something which we think is better. Mere opposition through criticism is, in our opinion, a good way to get into the bad graces of people in and around Congress.

In my interview with President Truman I stressed the need of our knowing about federal health plans right from the beginning, rather than after they are well under way or actually before Congress. He agreed that our experience and training in the front line of health service should make our assistance in planning such measures mandatory.

This interesting idea has come out of my several conferences with the President and other high officials in Washington. They want able men to represent us, medical and dental, but too often the men we delegate have become slightly arrogant in their attitudes because of their professional success. Also, such men, it is pointed out, are high fee men, and for them to consider honestly and justly the plight of persons for whom any federal health measure is being considered seems to be difficult. The suggestion is made that perhaps we are overlooking the help that we need by not selecting men who practice in small communities, and especially some who practice in localities of widely separated population.

Let us not forget that both associations have committees known as medical dental relations; suppose we try to give them more to do.

There seems to be some truth in the ideas one hears going over the country as your president and I have this past year, that with our high membership of persons all trained in some branch of the health service we should be closer knit, each within our own association and between the two associations. In other words, we are not making the most of this splendid membership. Why not give a little more thought to this angle and, with the public's welfare first in our thinking, close ranks and make a militant approach to the problems that our political brethren are so anxious to solve for us, and in too many cases without any help from us.

Dr. Arthur J. Bedell, Section on Ophthalmology, moved that the House follow the suggestion of the Speaker that the Reference Committee on Executive Session meet and hold deliberations in executive session. The motion was seconded by Dr. H. B. Everett, Tennessee, and carried.

After the Speaker announced that it was his opinion that all matters referring to the Red Cross Blood Bank should naturally fall to the Reference Committee an Emegency Medical Service, it was moved by Dr. Charles H. Phifer, Illinois, seconded by Dr. H. B. Everett, Tennessee, and carried, that the Reference Committee on Emergency Medical Service conduct its hearings in executive session.

REPORT OF SECRETARY

Dr. George F. Lull, Secretary, presented the report of the secretary as printed in the Handbook and then read a statement as follows:

LABOR SITUATION

The changed process by which The Journal is now being produced, and the changed appearance of the Handbook of the House of Delegates and of the program of the Scientific Assembly, are the result of a work stoppage in the composing room of the printing plant of the Association. This work stoppage has been in effect officially since March 8, but actually since shortly after the first of the year. This work stoppage is not, as implied by the two letters sent to each of you by the union affected, due to the truculence and antiunion attitude of your headquarters officials but is a symptom of a condition that unfortunately is common in the Chicago area, both in the newspaper and in the so-called job or publishing fields of the printing industry. This condition is not of our making, nor is it of the making of the newspapers or of the job printers of Chicago.

A brief statement of the history and background of this dispute, of our printing operations and of our relations with all the printing craft unions seems indicated.

In the issuance of our publications the Association has as employees members of the following unions: (1) Chicago Typographical Union no. 16, a component member of the International Typographical Union; this union has jurisdiction over our composing room; (2) the Chicago Stereotypers' Union no. 4, a component member of the International Stereotypers' and Electrotypers' Union; (3) Chicago Printing Pressmen's Union no. 3, subordinate to the International Printing Pressmen and Assistants' Union of North America; (4) Franklin Union no. 4, affiliated with the International Printing Pressmen and Assistants' Union of North America; (5) Chicago Paper Handlers' Union, Local no. 2, an affiliate of the International Printing Pressmen and Assistants Union of North America; (6) Bookbinders' and Paper Cutters' Union of Chicago, no. 8, a member of International Brotherhood of Bookbinders; (7) Bindery and Specialty Workers' Union, no. 182 (so-called miscellaneous bookbinders' help), affiliated with the International Brotherhood of Bookbinders; (8) Bindery Women's Union, no. 30, affiliated with the International Brotherhood of Bookbinders, and, finally, (9) Chicago Mailers' Union no. 2, affiliated with the International Typographical Union. These various unions admittedly differ in the skills required in the performance of their duties, and over the years certain monetary differentials in their compensation have been generally recognized, though obviously this is an extremely delicate point. In any event, any disturbance in these differentials is apt to cause upheavals in the industry. Possibly, and at least in practice, the highest scale of wages is paid to the so-called compositors, the union that has written the two letters to you, to the pressmen and to the stereotypers. Their scales are, for practical purposes, roughly equivalent.

Let me emphasize, then, that the unions with which we deal are affiliated with four different international unions—the International Typographical Union, the International Printing Pressmen and Assistants' Union of North America, the International Brotherhood of Bookbinders and the International Stereotypers' and Electrotypers' Union. Now traditionally the job or commercial printing industry in Chicago has been dealing through a trade association with these unions on the basis of contracts of a year or more duration. Our contracts with all of these unions expired as of Dec. 31, 1947.

Shortly after the enactment of the Taft-Hartley Act in July 1947, the International Typographical Union in convention promulgated a policy that forbade its local unions from entering into contracts of any specified term with employers, attempted to impose unilateral conditions of employment on employers terminable in effect on the will of the union, and was designed to effect certain conditions of employment made unlawful by the new law, such as continuance of the closed shop and the refusal to execute so-called struck work. The other international unions indicated and followed a policy of complying with the new law. Before Jan. 1, 1948, The Franklin Association of Chicago, which is a trade association of employers that concludes contracts with the unions that are binding in the Chicago area, concluded contracts with the several press and bindery unions, strictly in compliance with the law and calling for a maximum raise in the weekly wage scale of $6. These unions have honorably and loyally abided by their contractural commitments. The International Typographical Union, particularly its local representing the compositors, refused to conclude any lawful agreement and prior to March 27 or 28, 1948, insisted on a unilateral arrangement that was, in the opinion of the industry, unlawful and unconscionably onerous. Without making this statement too long, suffice it to say that because of the failure of the newspaper publishers to comply with the conditions, Chicago Typographical Union no. 16, on Nov. 24, 1947 struck the Chicago newspapers. They are still on strike.

Meanwhile, the job printers in Chicago continue to negotiate with this union. The union continued to work in job shops after Jan. 1, 1948 on the expiration of their contract, but beginning Jan. 16, 1948 by what in effect was central direction, the job printers refused to work overtime, and a series of crippling slowdowns occurred. If an employer agreed to operate under the unilateral conditions dictated by the union, which included a basic weekly scale of $95 for a thirty-six and one-fourth hour work week (an increase of $14.89 a week over the scale called for in the expired contract), overtime work was permitted, all the help was supplied that the employer required and full production was assured. If an employer refused to bow, operating conditions might at any time become chaotic and did so become in many plants for extended periods of time. Conditions in the composing rooms of Chicago rapidly became worse in February. In late February the President of the International Typographical Union, Mr. Woodruff Randolph, told the job printing employers of Chicago in an address to a meeting of the members of the Franklin Association that he planned no strike in Chicago but that unless the union proposals were acceded to there would be chaos in Chicago printing plants. During the week ending Monday noon, March 8, *no work of any description* was forwarded from the composing room of the Association to the stereotyping room of the Association and it became a foregone conclusion that The Journal of the American Medical Association for March 13 would not be issued on time, since without type from the composing room there obviously could be no stereotyping, no press work, no bindery work and no mailing. The Association had no rational alternative but to close its composing room until conditions could be restored to normal. This course had been adopted beginning March 3 by practically all of the larger printer employers in the Chicago area because of slowdowns and the failure of printing employees to execute work. As can be seen, the American Medical Association was not alone in this move—it was in fact late in the move, and by the end of March 10 job composing rooms employing over 2,000 printers were closed.

The situation city wide now stands practically as it was March 10. About 1,500 men on the newspapers and about 1,600 to 2,000 men (figures are not exactly determinable because of job transfers to other towns and other shops) in the job shops are out of work. It is difficult to tell the exact number.

On March 27 a federal judge in Indianapolis issued an injunction which had the effect of inducing the International Typographical Union to rescind the no-contract policy previously issued to its local unions. Promptly thereafter the Chicago job printers reopened negotiations with the union and met with the union on the average of twice a week during April and May. A legal contract was offered the union providing a weekly wage increase of $9.29 for a fifteen month term (precisely what was accepted by the union in New York City). The Union, however, has rejected the raise and apparently intends to force a settlement somewhere near a $14.89 a week increase. The employers have offered a weekly scale of $89.40. The Union wants $95. So far as the American Medical Association is concerned, any extension of the $89.40 means a corresponding increase to the other printing craft unions. When the dispute will be settled no one can presently foresee. The scale committee of the union and the employers are meeting Tuesday morning, June 22, and possibly a settlement may ensue within the near future.

The Journal has continued publication mainly through the use of the Vari-Type process. I must emphasize that that substitute process could not have eventuated into a journal without the active and loyal help and cooperation of all our other union employees and that in the view of the employees of the other eight printing craft unions and of their unions neither the American Medical Association nor the other job printing employers of Chicago are antiunion or out to destroy the union movement. In fact, relations with those unions are most cordial. After all, let us not be confused. We have at the Association about 300 union employees, about 230 are now working, are walking through picket lines and are, I am sure, proud to be employees of the American Medical Association.

I desire to express the pride and satisfaction that the Board has, that in spite of the difficulties encountered, which difficulties are beyond all our previous experience in our printing operations, essential printing operations at headquarters have been carried on and our publications still are being issued.

NOMINATIONS FOR AFFILIATE AND HONORARY FELLOWS

Affiliate Fellows

The Secretary, Dr. George F. Lull, presented nominations for Affiliate Fellowship which were referred to the Council on Scientific Assembly for recommendation.

Honorary Fellows

Dr. Lull also presented a list of nominations for Honorary Fellowship and was informed that since there was a question of suspending the By-Laws this matter would have to be introduced under New Business and not acted on until tomorrow, but that at this time the applications should be referred to the Council on Scientific Assembly for recommendation. They were so referred.

INTRODUCTION OF ASSISTANT SECRETARY, DR. ERNEST B. HOWARD

Dr. Lull introduced to the House the Assistant Secretary, Dr. Ernest B. Howard, who spoke as follows:

Mr. Speaker, Members of the House: I would simply like to take this opportunity to tell you what an honor it is to me to be a member of your headquarters staff and to assure you that I shall do everything in my power to carry out the responsibilities.

Report of Committee on Intern Placements

Dr. William Bates, Chairman, presented the following report, which was referred to the Reference Committee on Medical Education:

The Committee on Intern Placements was appointed by the Speaker of the House after the last meeting of the House of Delegates in January 1948. The appointment was the result of a resolution from New Jersey presented by Dr. Hilton Read of Atlantic City, and modified by the Reference Committee to read:

> Whereas, The number of positions for intern training in approved hospitals exceeds by large numbers the available interns; and
>
> Whereas, It is becoming increasingly difficult each year for approved hospitals and those hospitals desiring approval to secure interns from approved medical schools; therefore be it
>
> *Resolved,* That the Speaker of this House appoint a special Committee on Intern Placement consisting of five members, including two general practitioners, (*a*) to study the supply and distribution of interns with particular emphasis on furthering interest in general practice, (*b*) to cooperate with the Council on Medical Education and Hospitals and other interested agencies in an effort to arrive at a method leading to a better distribution of interns and (*c*) to present a report of its findings and recommendations to this House at the annual session in 1948.

Since the appointment, members of the committee have consulted teachers, medical school and hospital authorities, interns, residents and many practicing physicians.

On Saturday, June 19, 1948, this committee met with the Joint Intern Committee representing the Association of American Medical Colleges, the American Medical Association, and the Catholic and American Protestant Hospital Associations, and three representatives of the Council on Medical Education and Hospitals. Besides the members of this committee there were present:

Father John Barrett—President-Elect of Catholic Hospital Association of United States and Canada.

F. Stanley Howe—Director, Orange Memorial Hospital; Chairman American Hospital Association Committee on Internships.

Charles T. Dolezal, M.D.—Secretary, Council on Professional Practices of the American Hospital Association.

J. A. Curran, M.D.—President, Long Island College of Medicine; Chairman of the Committee on Internships and Residencies of the Association of American Medical Colleges.

Council on Medical Education and Hospitals: Donald G. Anderson, M.D., Secretary; Victor Johnson, M.D.; E. H. Leveroos, M.D.

As a result of these deliberations we wish to present the following recommendations:

We recommend that hospitals and medical schools which do not cooperate with the Plan for Uniform Intern Placement be reported to the Council on Medical Education and Hospitals of the American Medical Association for investigation and appropriate action.

(Plan for the Year 1948-1949 for Internships Beginning July 1, 1949:

1. Applications and credentials to be submitted only through the dean's office to hospitals, with the date for filing applications and release of credentials by the medical schools set at Oct. 15, 1948. Credentials ordinarily will consist of an executed application blank and a letter from the dean but do not preclude such letters from members of the faculty as they may wish to write, unsolicited by the candidate.

2. Applicants may visit hospitals and be interviewed by hospital intern committees, but the hospital administration shall not commit the hospital or obligate the applicant, or potential applicants, before Nov. 15, 1948.

3. No intern appointments shall be made prior to Nov. 15, 1948 from applicants who are members of the senior class in medical school. Hospitals may decline an applicant at any time.

4. Applicants shall accept or reject hospital appointments before midnight of Nov. 18, 1948.

5. These regulations shall apply only to undergraduate medical students who have not completed the fourth year of their medical school course.)

(Contemplated Changes in 1948 Uniform Intern Placement Plan. The Committee moved that item 3 of the plan be amended to read:

"No intern appointments shall be tendered prior to Nov. 15, 1948 to applicants who are members of the senior class in medical schools. Notice by telegram is preferable. Hospitals may decline an applicant at any time."

Also that item 4 of the plan be changed to read:

"Applicants shall send acceptances or rejections of appointments so that they are received at the hospitals by midnight of Nov. 18, 1948; but commitments by applicants shall not be required prior to that time.")

Secondly, in the interest of promoting general practice and better to prepare a physician to choose a specialty, we recommend that all specialty boards require at least one year of approved rotating internship before allowing a physician to start his specialty training.

Thirdly, we recommend that an approved rotating internship shall be of one or two years' duration; should include an educational training program in medicine, both organic and functional; obstetrics, pediatrics and surgery with especial emphasis on diagnosis under the supervision of a qualified educational director of interns. More of these internships should be for a term of two years. The specialty boards should be requested to give credit toward certification for work in their respective fields during the second year.

Fourthly, we recommend that hospitals at present approved for internship should be reappraised on the basis of their educational program for interns.

Fifth, we recommend that any hospital which does not provide an adequate educational training program for interns may be approved for general residencies for graduates who have completed an approved, rotating internship of at least one year.

Lastly, being mindful of the difficulties involved because of the differences in medical school requirements, the differences in state laws, the differences in requirements of specialty boards and the differences in hospital regulations and organizations, we recommend that the Council on Medical Education and Hospitals be and it is hereby instructed immediately to begin implementaton of these recommendations and to report at the next session of the House of Delegates the progress toward accomplishment of each of these recommendations.

Respectfully submitted,
William Bates, Chairman.
Deering G. Smith.
Mather P. Pfeiffenberger.
B. R. Kirklin.
Wilburt C. Davison.

REPORT OF JUDICIAL COUNCIL

Dr. E. R. Cunniffe, Chairman, presented the report of the Judicial Council as printed in the Handbook, and a proposed Revision of the Principles of Medical Ethics, a mimeographed copy of which had been sent each delegate.

The Speaker ruled that the House would consider the proposed revision of the Principles of Medical Ethics section by section as a Committee of the Whole, after which the House, sitting as a Committee of the Whole, considered the proposed revision section by section, recommending amendments to certain sections.

The House as a Committee of the Whole recessed at 1 p. m., to reconvene at 2:30 p. m.

Monday Afternoon, June 21

The House as a Committee of the Whole reconvened at 2:30 p. m., with the Speaker, Dr. R. W. Fouts, presiding.

Dr. E. R. Cunniffe continued with the reading of the proposed revision of the Principles of Medical Ethics, and the Committee of the Whole, after considering each section, voted to recommit the entire proposed revision to the Judicial Council, on motion of Dr. Lowell S. Goin, California, seconded by Dr. Mather Pfeiffenberger, Illinois, and carried.

Report of Joint Committee for the Coordination of Medical Activities

Dr. Ernest E. Irons, Chairman, presented the following report of the Joint Committee for the Coordination of Medical Activities, *a mimeographed copy of which had been given each delegate*:

Four meetings of the Joint Committee for the Coordination of Medical Activities have been held since the last report was made to the House of Delegates at the Atlantic City Session. Matters discussed at these meetings have followed the general trend of medical affairs as they have developed during the year. The Joint Committee is a forum in which the opinions and ideas of its members, who represent a wide variety of interests in the medical field, are discussed freely and without prejudice.

Reports of the discussions at the meetings have been published in The Journal of the American Medical Association, and it is evident from correspondence received that these reports are widely read.

The Joint Committee is made up of representatives of the American Medical Association, the American College of Physicians and the American College of Surgeons, and of liaison members who represent the following organizations:

Advisory Board for Medical Specialties.
American Dental Association.
American Hospital Association.
American Pharmaceutical Association.
American Red Cross.
Association of American Medical Colleges.
Catholic Hospital Association.
Federal Security Agency.
Federation of State Medical Boards.
Office of the Surgeon General, U. S. Army.
Bureau of Medicine and Surgery, U. S. Navy.
U. S. Public Health Service.
Veterans Administration.

During the past year the committee has discussed such diverse questions as the Hospital Survey and Construction Program, the status now and in the future of the general practitioner, nursing problems, the problems of medical service in rural areas, the World Medical Association, graduate education for Army and Navy medical officers, the desirability of a uniform Pharmacy Practice Act, the various phases of the American Red Cross Blood Bank Program, disposal of war surplus supplies and, recently, questions arising from the National Conference on Family Life, the National Health Assembly and the medical implications of the reorganization of federal agencies.

It is not the purpose of the Joint Committee to make official pronouncements on any of the matters which it discusses, nor, without specific authorization, to commit the organizations which its members represent to any course of action. Its chief function is to give opportunity for exchange of information and ideas in the varied fields of medical interest, and thus in most instances to arrive at a common understanding.

Respectfully submitted for the Committee,
Ernest E. Irons, Chairman.

REPORT AND SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

Dr. H. G. Weiskotten, Chairman, presented the Report of the Council on Medical Education and Hospitals as printed in the Handbook and the following Supplementary Report, which were referred to the Reference Committee on Medical Education:

To the Members of the House of Delegates of the American Medical Association:

The Council on Medical Education and Hospitals respectfully directs the attention of the House of Delegates to the functions of the Council as set forth in the By-Laws of the American Medical Association, which state under Chapter IX, Section 2, that "The functions of the Council on Medical Education and Hospitals shall be:

"1. To investigate conditions of medical education including premedical, undergraduate and graduate medical education, hospitals and associated subjects and to suggest means and methods by which the same may be improved;

"2. To endeavor to further the realization of such suggestions as may be approved by the House of Delegates."

In the past, from time to time, resolutions have been introduced into the House of Delegates providing for the Council's conditioning its approval of the educational programs of hospitals and medical schools on the financial arrangements that such institutions enter into with the members of their professional staffs.

The Council is of the belief that it is not the agency of the American Medical Association to pass on such matters. The Council has been advised that conditioning approval of educational programs of hospitals and medical schools on any other basis than educational standards might be interpreted as illegal by the federal courts.

Respectfully submitted,
H. G. Weiskotten, Chairman.
Harvey B. Stone.
Reginald Fitz.
Russell L. Haden.
William S. Middleton.
Virgil P. Sydenstricker.
Victor Johnson.
Donald G. Anderson, Secretary.

REPORT AND SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL SERVICE

Dr. James R. McVay, Chairman, presented the Report of the Council on Medical Service as printed in the Handbook and the following Supplementary Report, which were referred to the Referencee Committee on Medical Service and Prepayment Insurance:

REPORT OF THE MEDICAL CARE SECTION OF THE NATIONAL HEALTH ASSEMBLY IN WASHINGTON MAY 1-4, 1948

American medicine came out of the recent National Health Assembly in Washington with added friends, prestige, influence and stature. Complete failure on the part of those who desired to force a recommendation for a national sickness compulsory insurance plan through the Assembly placed the American Medical Association and the state and county medical societies in a position to make available the benefits of the Ten Point National Health Program for the health of the American people already outlined by the House of Delegates of the American Medical Association. Those favoring the compulsory program, which would bind both patient and physician in government regulation and red tape, concentrated their efforts on the Medical Care Section, one of the fourteen sections of the Assembly.

Their failure was due to the action taken by the Steering Committee of the Medical Care Section among whose members were Dr. James R. McVay and Dr. Thomas A. McGoldrick.

The Steering Committee made the following recommendations, which were adopted by the section, but as there was no form of voting on resolutions and recommendations, the delegates were not committed officially in any way:

1. Adequate medical service for prevention of illness, care and relief of sickness and promotion of a high level of physical, mental and social health should be available to all without regard to race, color, creed, residence or economic status.

2. The principle of contributory health insurance should be the basic method of financing medical care for the large majority of the American people, in order to remove the burden of unpredictable sickness costs, abolish the economic barrier to adequate medical services and avoid the *indignities* of a "means test."

3. Health insurance should be accompanied by such use of tax resources as may be necessary to provide additional (*a*) services to persons or groups for whom special public responsibility is acknowledged and (*b*) services not available under prepayment or insurance.

4. Voluntary prepayment group health plans, embodying group practice and providing comprehensive service, offer to their members the best of modern medical care. Such plans, furthermore, are the best available means at this time of bringing about improved distribution of medical care, particularly in rural areas.

5. The people have the right to establish voluntary insurance plans on a cooperative basis and legal restrictions upon such right (other than those necessary to assure proper standards and qualifications), now existing in a number of states, should be removed.

6. High standards of service, efficient administration and reasonable costs require: (*a*) coordination of the services of physicians, hospitals and other health agencies in all phases of prevention, diagnosis and treatment; (*b*) effective cooperation between the providers and the consumers of such services.

7. A medical care program itself will not solve the health problems of the nation. It must be coordinated with all efforts directed toward providing the people with adequate housing, a living wage, continuous productive and creative employment, under safe working conditions, satisfying recreation and such other measures as will correct conditions that adversely affect the physical, mental and social health of the people.

8. There are areas on which the Planning Committee is not yet prepared to report. In the meeting of the Medical Care Section, differing views were expressed as to the method of effectuating the principle of prepayment or insurance. Some believe it can be achieved through voluntary plans. Others believe that a national health insurance plan is necessary.

The following conclusions were approved by the section relative to points to be measured in determining the effectiveness of prepayment plans in meeting the medical care needs of the people:

Points On Effectiveness

1. The extent to which a prepayment plan makes available to those it serves the whole range of scientific medicine for prevention of disease and for treatment of all types of illness or injury.

2. The proportion a plan covers of the population of its areas —local, state or national, as the case may be. (Cost in relation to ability to pay, restrictions on enrolment imposed by actuarial considerations, income level, age, conditions of employment, means of securing enrolment and collecting premiums.)

3. The degree to which a plan makes use of and encourages the development of a high quality of medical care for its subscribers. (Standards of personnel and facilities; organization of services; emphasis on prevention of disease; promotion of health, health education.)

4. The degree to which freedom and willingness to experiment with methods of payment and operation are encouraged in a plan.

5. The degree to which a plan succeeds in arranging amounts and methods of payment and conditions of participation that are satisfactory to physicians, hospitals, and others serving the plan's subscribers.

6. The extent to which efficiency and economy in the operation of a plan are achieved and encouraged by its basic policies and its administrative techniques.

7. The extent to which the individuals or board who carry the ultimate responsibility for a plan represent the interest of those entitled to service and those who are paying the cost, as well as of the physicians, hospitals, or others who are providing the services.

How To Improve Them

The following principles for the improvement of voluntary prepayment plans were listed:

1. There should be the freest opportunity for full cooperation among the providers and consumers of service in the establishment and the administration of medical care plans, provided that full control of the practice of medicine in the program must remain with doctors.

2. The Medical Care Section strongly urges the importance of joint conferences at the earliest possible date among representatives of the American Medical Association and of groups representing the consumers of medical care and services to study the question of establishment and administration of medical care plans.

Among those who represented the American Medical Association, state medical societies and allied groups in the Medical Care Section according to the official list were:

Dr. Thomas A. McGoldrick, Brooklyn, Vice-President, American Medical Association, and member of the Council on Medical

Service; Dr. James R. McVay, Kansas City, Mo., Chairman, Council on Medical Service; Dr. E. S. Bagnall, Chairman Legislative Committee, Massachusetts Medical Society; Dr. E. Dwight Barnett, Detroit, American Hospital Association; Dr. Gunnar Gundersen, State Medical Society of Wisconsin; Dr. Augustus P. Hauss, President-Elect, Indiana State Medical Association; Dr. Charles C. Hayden, Medical Director, Massachusetts Medical Service; Mr. John H. Hayes, New York City, American Hospital Association; Mr. Thomas A. Hendricks, Secretary, Council on Medical Service; Dr. Elmer Hess, Erie, Pa., President, Medical Society of the State of Pennsylvania, and member, Council on Medical Service; Mr. Jay Ketchum, Michigan Medical Service; Dr. Walter B. Martin, Norfolk, Va., member, Council on Medical Service; Dr. E. J. McCormick, Toledo, Ohio, member, Board of Trustees, American Medical Association, and Council on Medical Service; Mr. Maurice F. Norby, American Hospital Association; Dr. Frederick Quigley, Medical Society of New Jersey; Dr. L. Howard Schriver, Cincinnati, President, Associated Medical Care Plans; Dr. James Stevenson, Tulsa, Okla, Oklahoma State Medical Association; Mr. E. A. Van Steenwyk, Philadelphia Blue Cross Commission; Mr. Charles Crownhart, Secretary, State Medical Society of Wisconsin, and Mr. Howard Hassard, California Medical Association.

In addition, representatives of American medicine on the Executive Committee of the Assembly who spoke at the Medical Care Section were: Dr. George F. Lull, Secretary and General Manager of the American Medical Association; Dr. R. L. Sensenich, President-Elect, American Medical Association; Dr. Edward L. Bortz, Philadelphia, President, American Medical Association; and Dr. Paul R. Hawley, Executive Officer, Blue Cross-A. M. C. P. organizations.

Other physicians and representatives of state medical societies attended the section from time to time.

Much has been written on the Assembly, but the final evaluation of this meeting can not be made until Oscar Ewing makes his report to President Truman.

Arrangements for discussion meetings with spokesmen for labor and the cooperative groups have been made by the Council on Medical Service and the Committee on Rural Medical Service.

In conclusion, no report can be made on the Medical Care Section without mentioning the fair and impartial method in which Dr. Hugh Leavell of the Harvard School of Public Health, Chairman, handled the sessions.

COOPERATION WITH NATIONAL CONGRESS OF PARENTS AND TEACHERS

The National Congress of Parents and Teachers has submitted a request to the American Medical Association that representatives of the state medical associations meet with them, together with representatives of other health agencies, to consider problems relative to child health in their several areas. The Council on Medical Service recommends that we comply with this request.

REPORT ON JUNE 19 MEETING

The Council on Medical Service desires to report to the House of Delegates on a meeting held at the headquarters of the American Medical Association on June 19 at the call of the Council. This meeting consisted of the official representatives of thirty-six state medical associations and the Hawaii Territorial Medical Association.

This meeting was called to consider problems relative to prepayment medical and hospital care plans.

After a period of free discussion participated in by a majority of the representatives present, the entire matter was referred to the Council on Medical Service for further study.

The Council will carry on this further study with the Blue Shield Commission and report at a later date to the House of Delegates.

WASHINGTON OFFICE OF THE COUNCIL ON MEDICAL SERVICE

Several months have elapsed since the writing of the original report, and we take this occasion to report what has happened in the meantime.

The two National Health bills, S. 545 and S. 1320, and S. 140, which would create a Department of Health in the cabinet, have all been pigeonholed, and no action has been taken on the companion bills in the House. The Medical Examination of School Children bills, S. 1290 and H. R. 1980, have been pigeonholed in their respective Houses. The same is true of S. 1679—Murray and H. R. 4303—Dingell Dealing with the Extension of Disability Insurance.

Of the Public Health Unit bills (S. 2189—Saltonstall, H. R. 5644—Dolliver, and H. R. 5678—Priest,) only Mr. Dolliver's bill was reported out by the House Committee, but will very likely die there.

S. 2215, Bridges' bill providing for Research in Diseases of the Heart and Circulation, was passed by both Houses and has gone to the President. Two similar bills, H. R. 5087—Keefe and H. R. 5159—Smathers, were tabled by the House Committee in favor of S. 2215.

The House Appropriations Bill, which was discussed in the previous report, was passed by the Senate with very few changes, and awaits the signature of the President.

In the meantime, a Supplementary Appropriations Bill has been passed by both Houses, providing for an additional $1,000,000 for Assistance to States, General; $9,028,000 for Mental Health Activities; $1,115,000 for Emergency Disease and Sanitation Investigations and Controls in Alaska, and $22,000,000 to the Children's Bureau, which approximately equals the fiscal budget. An item of $75,000 was added to meet the expenses of preparing for the 1950 White House Conference on Children and Youth. When this bill was considered by the Senate, a provision was included which would have authorized the setting aside from the $1,000,000 allowed for Assistance to the States, General, of $132,000 to finance twenty-five four-year scholarships to be used in educating persons who would practice in areas where there might be acute need of physicians, as in the Negro areas of the South, the Spanish-American areas of the Southwest and sections where migrant rural workers locate. In conference the House refused to accept the inclusion, and it was dropped. The bill also provides for the transfer of the United States Employment Service from the Department of Labor to the Federal Security Agency. The President objected to this legislation and vetoed the bill. Congress overrode his veto.

The Dental Research Bill, H. R. 6726, authorizing the establishment of a Research Center under the Public Health Service, was passed by both Houses and awaits the President's signature.

The Senate Committee on Labor and Public Welfare authorized its Subcommittee on Health (Chairman, Senator Smith) to continue its study of public health problems and to make a report by March 15, 1949. The committee has a budget of $10,000.

Our membership in the World Health Organization has been established, and delegates are being named. We understand that the House Foreign Affairs Committee Chairman and probably one or two members of the Committee will attend the Conference.

The Senate passed its Selective Service Bill, S. 2655, in which under Section 4 (c) all physicians under the age of 45 would be required to register for service. When it was being debated Senator Murray and Senator Pepper offered an amendment to the effect that no doctors should be called if a sufficient number volunteered. Senator Gurney, Chairman of the Armed Services Committee, said that he would accept the amendment, but it was defeated. It provides for supervision by a civilian board and designates those who were educated at Government expense or who were deferred for their education as the first group to be called. The House bill, H. R. 6401, under Section 4 (c) also required physicians under 45 years of age to register. The Council on National Emergency Medical Service presented an objection to the Committees in both Houses to their respective bills, particularly to the provision requiring the registration of physicians. Neither Armed Services Committee was inclined to withdraw the registration provision.

More time was allowed for developing opposition to the House bill. State societies were asked to communicate with their Congressmen, and there is abundant evidence that they did so. From the Washington office a night telegram was sent to each Representative the day before the bill was to be discussed on the floor of the House. When the bill was reached on the floor, Congressman Anderson, of California, offered an amendment providing that no physician should be called up before three months after the enactment of the Act and then only if an adequate number did not volunteer. Congressman William Miller, of Connecticut offered another amendment, calling for the elimination of Section 4(c). He ably stated his reasons and was staunchly supported by Dr. Fenton, Congressman from Pennsylvania, Dr. Judd, Congressman from Minnesota, and Dr. Miller, Congressman from Nebraska. Many others enthusiastically supported the amendment, and it was adopted on an aye and nay vote. While writing this report, the House passed its bill, and a Joint Conference Committee will be named immediately to study the two bills. It is altogether possible that some changes will be made, and we have filed with the conferees of both committees a protest against the section requiring registration of physicians under 45.

Dr. Paul Hawley, who was a member of the National Security Resources Board, retired, and Dr. James Crabtree, from the Public Health Service, has been appointed to succeed him.

The Brookings Institution has published its full report of the study it made on "The Issue of Compulsory Health Insurance." It has also published a most informative study entitled "Governmental Costs and Tax Levels." At the last day of the hearings on the National Health Bills, Senator Murray announced that he would file with the Committee a critique, prepared by the Committee for Research on Medical Economics in conjunction with the Public Affairs Institute of New York City, analyzing and refuting some of the statements included in the Brookings study.

The Citizens' Advisory Council, an organization set up by the Senate Committee on Finance about a year ago (Chairman, Edward R. Stettinius) has filed two reports thus far. The first contained a twenty-two point program for expanding and modernizing the Social Security Law to provide ultimate protection for virtually everybody in the United States under the Acts (Old Age Retirement and Survivors' Insurance Program) with much higher benefits than at present. The second report recommended monthly cash benefits to workers deprived of earning power because of permanent and total disability. Monthly benefits would be paid under the Social Security Acts and Old Age and Survivors' Insurance Program when a person covered by the program becomes permanently and totally disabled.

Activities of the Washington Office have multiplied very rapidly during the last few months. The mailing list has now passed the twenty-one hundred mark. We have mailed to each Congressman a copy of Dr. Rappleye's "Comments Made at Hearing Before the New York State Commission on the Need for a State University," as well as the pamphlet entitled "Extension of Rural Medical Service" which was prepared by the Committee on Rural Medical Service. We also sent out to the Congressmen the National Health Program of the American Medical Association.

Our night telegram to the Congressmen, outlining our objection to the draft bill, was much appreciated, if the acknowledgements that we have received can be used as a guide.

In several instances during the past year when a committee has been studying an important bill we have written a letter from this office to each member of the committee outlining the Association's attitude toward its provisions. Our efforts in this activity have been so well received by the Congressmen that we shall do it more often in the future.

Respectfully submitted,

James R. McVay, Chairman.
Alfred W. Adson, Vice Chairman.
Edward L. Bortz.
H. H. Shoulders.
E. J. McCormick.
George F. Lull.
Jesse D. Hamer.
Elmer Hess.
Thomas A. McGoldrick.
Walter B. Martin.
Joseph S. Lawrence, Director,
Washington Office.
Thomas A. Hendricks, Secretary.

REPORT OF COUNCIL ON SCIENTIFIC ASSEMBLY

Dr. Henry R. Viets, Chairman, presented the Report of the Council on Scientific Assembly as printed in the Handbook, which was referred to the Reference Committee on Medical Education but which was later withdrawn from that committee and referred to the Reference Committee on Sections and Section Work.

Report of Special Committee to Study Revison of the Constitution and By-Laws

Dr. F. F. Borzell, Chairman, requested the Speaker, in view of the lateness of the hour and the necessity of introducing new business, to defer presentation of this report, and the Speaker declared that it would be deferred until after the presentation of new business.

NEW BUSINESS

Resolutions on Specialty Boards

Dr. Edward P. Flood, New York, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

Whereas, It has always been the admitted aim of the American Medical Association to encourage hospital affiliations for all physicians; and

Whereas, Many hospitals are taking restrictive measures with respect to staff appointments and promotions in order to satisfy requirements established by Specialty Boards; and

Whereas, These requirements of the numerous self-appointed and self-perpetuating specialty boards are often arbitrary, variable and discriminatory; and

Whereas, The accepted method of granting license to practice medicine and surgery is reserved to the various states and the right to practice a specialty, being a logical extension of this method, should be state controlled by standards set up through the various state societies and associations and their components; and

Whereas, It has been accepted as a first principle in the administration of American justice that a man be judged by a jury of his peers; and

Whereas, The Council on Medical Education and Hospitals of the American Medical Association, with the concurrence of the Advisory Board for Medical Specialties, has stated that

> "Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients as judged by the professional staff of the hospital and not on certification or special society membership"; and

Whereas, This entire problem presents a challenge to the ability of the American Medical Association to regulate itself with justice to all members and to advance the cause of Public Health and Welfare through the improvement of medical standards; therefore be it

Resolved, That the Medical Society of the State of New York through its delegates requests the American Medical Association to take measures to arrest and correct this inequitable situation until such time as means may be found to place certification of specialists on a more reasonable, democratic and local basis; and be it further

Resolved, That, failing to obtain cooperation from the various Specialty Boards and hospitals, the American Medical Association is requested to withhold recognition from those hospitals which make certification by a Specialty Board a necessary qualification for appointment or promotion on a hospital staff.

Proposed Amendment to By-Laws Re Citation for Distinguished Service

Dr. William Weston, Section on Pediatrics, presented the following amendment to the By-Laws, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

CHAPTER VI.—BOARD OF TRUSTEES

Section 6. Citation for Distinguished Service.—The Board of Trustees shall create and establish an award, to be known as the Citation for Distinguished Service, which shall consist of a suitably engrossed citation. The Board of Trustees shall consider the merits of nominees for this citation who shall be persons not of the medical profession and who have by their cooperation and aid in the advancement of medical science, medical education or medical care contributed to the achievement of the ideals of American medicine. The Board of Trustees shall nominate to the House of Delegates on the first day of the annual session of each year not more than three persons with the qualifications on which the Board of Trustees bases its recommendation. The House of Delegates shall vote immediately by voice vote on each of the persons thus nominated.

The Board of Trustees shall be charged with the duty of preparing a suitable citation and with arranging for the conferring of these citations at such time as may seem suitable.

Resolution on Cancer Detection Centers

Dr. George W. Kosmak, New York, presented the following resolution, which was referred to the Reference Committee on Medical Education:

Whereas, The detection and diagnosis of malignant disease is an essential medical function and responsibility; and

Whereas, As the result of public and professional demands, centers and clinics for this purpose have been organized and are operating widely throughout this country; and

Whereas, There is need for standards of operation, procedure, equipment and particularly of adequately trained personnel for the conduct of these institutions on a more or less uniform basis; and

Whereas, It is also essential that distinctions be drawn in the operation of such clinics and centers between the detection and/or diagnosis of possible malignant disease; therefore be it

Resolved, That the American Medical Association through its appropriate body take steps to cooperate with the American Cancer Society and other agencies engaged in this activity, for the purpose of formulating standards of procedure and conduct in the operation of cancer detection and diagnostic centers and that the results of these studies be adequately publicized to those concerned, including the medical profession and the public.

Resolutions on Closer Integration of Medical Services of Army, Navy and Air Force

Dr. Joseph P. Henry, New York, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

Whereas, It is apparent that a much closer integration of the medical services of the Army, Navy and Air Force would lead to greater efficiency, increased economy and a higher level of medical care; and

Whereas, Studies of means and methods of this integration have been undertaken by certain agencies or committees of the government; and

Whereas, It is believed that these studies should be developed with the greatest possible speed consistent with sound planning; therefore be it

Resolved, That the House of Delegates of the American Medical Association is heartily in favor of this integration; and be it further

Resolved, That the House of Delegates of the American Medical Association requests that the President of the United States and the Secretary of National Defense develop immediately ways and means to further this integration; and be it further

Resolved, That a copy of these resolutions be sent to all members of the Armed Services Committees of both the Senate and House of Representatives.

Resolution On Blue Cross

Dr. C. B. Conklin, District of Columbia, presented the following Resolution, which was referred to the Reference Committee on Medical Service and Prepayment Insurance:

Whereas, During the past several years, employees of the American Medical Association have been covered by Blue Cross; and

Whereas, The Blue Cross found it necessary to increase its rates and, when its officials were questioned by officers of the American Medical Association with regard to further increases, could give no assurances that they would not occur; and

Whereas, The American Medical Association saw fit to withdraw its hospitalization coverage from Blue Cross, contracting with a commercial insurance carrier for hospitalization and medical service coverage for its employees; be it

Resolved, That the Medical Society of the District of Columbia deplores the American Medical Association's failure to support voluntary nonprofit hospital and medical care plans, believing it will greatly handicap these plans in the future. It recommends that the Board of Trustees of the American Medical Association instruct the Secretary and General Manager to negotiate with Blue Cross officials in an effort to reinstate the contract for the coverage of employees of the American Medical Association at the expiration of its present policy.

Resolution on Association of Interns and Medical Students

Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Whereas, The Association of Interns and Medical Students and the Association of International Medical Students are exhibiting communistic tendencies in their organization; and

Whereas, The American medical profession is opposed universally to any organization which advocates the overthrow of the United States government by force and violence; and

Whereas, These intern organizations and medical students favor strikes that are upsetting to proper medical education; and

Whereas, It is said that these organizations have communistic affiliations; therefore be it

Resolved, That our Council on Medical Education and Hospitals be requested to investigate these organizations as to facts, tendencies, affiliations and objectives, and that a report of the findings of the Council be given to the House of Delegates at the earliest opportunity.

Resolutions on Hospital Exploitation of Professional Medical Services

Dr. J. W. Bird, Maryland, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

Whereas, The practice of radiology, pathology and anesthesiology is recognized by the American Medical Association as the practice of medicine; and

Whereas, Leading hospital organizations of the United States have recognized the fact; and

Whereas, There is a tendency on the part of certain hospital administrators to utilize the profits resulting from the operation of these departments in their institutions; and

Whereas, This constitutes exploitation of professional medical services; and

Whereas, This is contrary to medical ethics; therefore be it

Resolved, That it is the sense of the Council that this practice should be condemned; and be it further

Resolved, That the Section on Radiology of the Baltimore City Medical Society urge the House of Delegates of the American Medical Association to instruct the Board of Trustees of the American Medical Association to direct the Council on Medical Education and Hospitals to refuse approval for training of residents and interns of any hospital exploiting professional medical services.

Resolution on Approval of Hospitals

Dr. S. J. McClendon, California, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

Resolved, That the Board of Trustees of the American Medical Association and the Association itself, acting through this House of Delegates, cause the Council on Medical Education and Hospitals of the American Medical Association to add to its basic requirements for the approval of a hospital for intern and resident training the express condition that the hospital establish to the satisfaction of the Council on Medical Education and Hospitals that no unethical practices by doctors of medicine, the hospital itself or others have been permitted to exist or to take place within the hospital.

Resolutions on Medical Education

Dr. S. J. McClendon, California, presented the following resolutions, which were referred to the Reference Committee on Medical Education:

Whereas, The preservation of freedom is essential to progress and the continued complete separation of schools, (public and private) from the Federal Government is essential to the preservation of freedom; and

Whereas, Federal subsidization of medical students is clearly not a function of the Federal Government and would violate the Tenth Amendment to the Constitution; now, therefore, be it

Resolved, That the American Medical Association is unequivocally opposed to any invasion by the Federal Government into any phase of the schools or students of the country, except for the military academies of the armed services; and be it further

Resolved, That the American Medical Association is specifically opposed to the report of the Committee for the Improvement of Child Health of the American Academy of Pediatrics recommending federal support for pediatric education; and be it finally

Resolved, That minority specialty groups should be restricted by the American Medical Association from advancing and/or approving proposals affecting the interests of the public and the medical profession generally before proper endorsement by the American Medical Association.

Resolutions on Emergency Medical Service

Dr. Ralph B. Eusden, California, presented the following resolutions, which were referred to the Reference Committee on Emergency Medical Service.

Resolved, That the American Medical Association, through its Council on National Emergency Medical Service, its Board of Trustees and/or other appropriate bodies, councils or committees, offer its full services to the armed forces of the United States Government in planning orderly methods of selection and induction of medical officers for military and civilian service in case of need; and be it further

Resolved, That a survey of all physicians in the United States, its territories and possessions, be made, with reference to location, ratio of physicians to population, sex, age, health, dependency status, professional training, military service, holding of reserve commissions, probable availability for military service and any additional data which may be deemed advisable so that plans and methods may be considered and drawn up for determining availability for military and civilian service.

Resolutions on Hospitals and Medical Schools Engaging in the Practice of Medicine

Dr. Robert E. Schlueter, Missouri, presented the following resolutions, which were referred to the Reference Committee on Medical Education:

Whereas, There is an ever increasing tendency on the part of hospitals and medical schools throughout the United States to engage in the practice of medicine for profit; and

Whereas, This corporate practice of medicine is a professional evil second only in its consequences to socialized medicine; and

WHEREAS, Such practice constitutes not only exploitation of the medical profession but perhaps also of the patient; therefore be it

Resolved, That the House of Delegates of the Missouri State Medical Association in convention assembled condemns the practice of medicine for profit by either hospital or medical school; and be it further

Resolved, That our Delegates to the American Medical Association be instructed to present this information to the House of Delegates of the American Medical Association; and be it further

Resolved, That the American Medical Association remove every hospital engaged in the practice of medicine from its list of hospitals approved for internship and residency training; and be it further

Resolved, That the American Medical Association remove any offending medical school from its list of institutions approved for medical teaching.

Resolution on Life Insurance Fees

Dr. William F. Costello, New Jersey, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The life insurance companies of the United States have been requested by various state medical societies, including the Medical Society of New Jersey, to increase the standard medical fee for regular life insurance examinations from $5 to $10, and to increase other medical insurance fees in like proportion; and

WHEREAS, These fees have not been changed in more than fifty years, and should be adjusted in recognition of changing economic conditions and advancing standards of medical practice; and

WHEREAS, This is a matter of national policy in which the action of single state societies is futile, and relief can be hoped for only by action of the American Medical Association; therefore be it

Resolved, That the House of Delegates of the American Medical Association request the Board of Trustees to negotiate with representatives of the life insurance industry with a view to obtaining a nationwide upward adjustment in the level of fees paid by life insurance companies to physicians for regular medical examinations and other medical services rendered on request of life insurance companies on behalf of their policy holders.

Resolution on Policy of Federal Children's Bureau

Dr. William F. Costello, New Jersey, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The United States Children's Bureau administers Federal grants-in-aid to states operating tax-supported programs of service to crippled children; and

WHEREAS, These grants in-aid are made on the basis of a plan submitted by each state crippled children's agency as subsequently approved by the United States Children's Bureau; and

WHEREAS, In administering these grants-in-aid, the United States Children's Bureau has advised various states on standards of care including qualifications of various types of professional personnel who may render services in the state programs; and

WHEREAS, The United States Children's Bureau had adopted as its policy a recommendation of its Advisory Committee on Services for Crippled Children formulated by that Committee on October 10, 1936, and providing that:

> Only surgeons who are certified by the American Board of Orthopedic Surgery, or are eligible for such certification, should be approved by a State agency for surgical services for children suffering from orthopedic conditions.
>
> These surgical services include prescriptions for any prosthetic appliances which the orthopedic condition requires; and

WHEREAS, The observance of this policy by a State Crippled Children's Commission, as a prerequisite to its receiving federal aid, excludes many qualified orthopedic surgeons and general surgeons from rendering services for children suffering from orthopedic conditions and constitutes an arbitrary limitation on their right to practice medicine within the scope of their state licenses and their recognized professional qualifications; therefore be it

Resolved, By the House of Delegates of the American Medical Association that the Board of Trustees be directed to enter a formal protest against this policy with the United States Children's Bureau recommending to that Bureau that its policy be liberalized in such a way as to permit all Fellows of the American College of Surgeons, whether or not certified by the American Board of Orthopedic Surgery, to be approved by the respective state agencies for crippled children, in order that their signatures may be honored on reports of such cases and on prescriptions for prosthetic appliances required in the treatment of these patients.

Resolutions on Single Examination Acceptable to Armed Forces

Dr. Deering G. Smith, New Hampshire, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, It is considered that in the examination of selective service candidates during World War II a great many physician man-hours were wasted by needless reexaminations of candidates; and

WHEREAS, The elimination of such waste of physician man-hours is highly desirable; therefore be it

Resolved, That the House of Delegates of the New Hampshire Medical Society is in favor of a single examination, acceptable to the armed services, in the event of the passage of a Selective Service Act or a Universal Military Training Program; and be it further

Resolved, That the House of Delegates of the American Medical Association be asked to take similar action and that its resolution be transmitted to the appropriate federal authorities.

Resolutions on Paying Physicians Engaged in Examinations for Armed Forces

Dr. Deering G. Smith, New Hampshire, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, It is estimated that 1,200,000 candidates for Selective Service or Universal Military Training will be examined each year; and

WHEREAS, The examination of these candidates is in itself a large volume of work; and

WHEREAS, It is considered that the most equitable means of having this work done on a just basis is that it be done on a fee basis; therefore be it

Resolved, That the House of Delegates of the New Hampshire Medical Society recommends that physicians engaged in these examinations be paid for their work; and be it further

Resolved, That the House of Delegates of the American Medical Association be asked to take similar action and that its resolution be transmitted to the appropriate federal authorities.

Resolutions on Opposition to Amendment to Present Constitution, Article 8, Section 1

Dr. Allen H. Bunce in behalf of the Medical Association of Georgia, presented the following resolutions, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws:

WHEREAS, The Medical Association of Georgia entered into a solemn covenant with other similar state, territorial and district associations to form the American Medical Association as it is now constituted; and

WHEREAS, This covenant is known as the reorganization act of 1902, as evidenced by amendments to the American Medical Association's Articles of Incorporation of 1897 as amended in 1902, known as the "Constitution, or Articles of Incorporation" of 1902; and

WHEREAS, Article 8, Section 1, of the present Constitution of the American Medical Association is a vital part of the aforesaid covenant; therefore be it

Resolved, That the Medical Association of Georgia, in convention assembled, hereby voices its opposition to any change in said Article 8, Section 1, of the present Constitution of the American Medical Association; and be it further

Resolved, That a copy of this resolution be sent to the Secretary, the Speaker of the House of Delegates and the Chairman of the Committee on Revision of the Constitution and By-Laws of the American Medical Association.

Resolution on Staff Personnel at Headquarters

Dr. Allen H. Bunce, Georgia, presented by title a Resolution on Staff Personnel at Headquarters, which was referred to the Reference Committee on Executive Session.

(To be continued)

FOREIGN REGISTRATION AT THE ANNUAL SESSION

Foreign registrations at the Annual Session in Chicago on the first day were 124; second day, 122; third day, 29, and the fourth day, 29, for a total of 304.

Here is a breakdown of the registrations:

South America	57
Central America	4
Canada	52
England	21
Philippines	14
Cuba	14
Mexico	11
Spain	10
China	9
Hawaii	9
Belgium	8

Washington Letter

(From Our Regular Correspondent)

June 30, 1948.

U. S. Delegation Attends First World Health Conference

The twenty-one persons representing the United States at the first World Health Assembly in Geneva, Switzerland, are headed by Dr. Thomas Parran as chairman. Additional delegates are: Dr. Martha M. Eliot, associate chief, U. S. Children's Bureau, and Dr. James R. Miller, American Medical Association. Five alternate delegates are: Dr. Francis P. Corrigan, political adviser on Latin America of the American Delegation to the United Nations at New York; James A. Doull, chief, Office of International Health Relations, Federal Security Agency; Dr. Wilton Halverson, director, California Public Health Service, San Francisco; Dr. H. van Zile Hyde, alternative U. S. Representative, interim commission, World Health Organization, and Durward V. Sandifer, deputy director, State Department, Office of United Nations Affairs. The following thirteen persons are advisers: Howard B. Calderwood, State Department, Division of United National Economic and Social Affairs; Nelson H. Cruikschank, American Federation of Labor; D. Albert W. Dent, president, Dillard University, New Orleans; Morton Kramer, chief of research and information for international health relations, U. S. Public Health Service; Mrs. David M. Levy, president, Citizens Committee of Children of New York City; Dr. James E. Perkins, managing director, National Tuberculosis Association, New York City; Miss Lucile Petry, director, Division of Nursing, U. S. Public Health Service; Alvin Roseman, U. S. Budget Bureau; Dr. Paul F. Russell, malariologist, Rockefeller Foundation; James S. Simmons, dean, School of Public Health, Harvard University; John Tomlinson, State Department, Division of United Nations Economic and Social Affairs; Col. Tom Whayne, U. S. Army Medical Corps, and Professor Abel Wolman, Johns Hopkins University.

Permanent Civilian Defense System Stresses Medical Care

Medical care during national emergencies is an important phase of the new civilian defense program. This was revealed when Civil Defense Director Russel J. Hopley said that he expects to complete by next month a plan for a permanent civil defense system affording protection for Americans against germ warfare, atom bombs and guided missiles. Members of the medical profession will be expected to provide leadership and trained personnel for this voluntary civilian program.

Funds for Health Institute

One of President Truman's last acts before adjournment of the eightieth session of Congress for the national political conventions was to sign the second deficiency bill, carrying funds for a wide variety of federal agencies. Among the projects was the provision of $1,000,000 for the new Heart Institute, part of the fund to be spent at the $40,000,000 research center and laboratory to be built soon at Bethesda, Md.

Agency Awards Funds for Nine Cancer Projects

Federal Security Administrator Oscar R. Ewing announced the awards of $162,073 in federal grants for nine cancer control projects. Largest was for $43,320 to the California Department of Public Health to establish a cancer training center at the University of California. With these awards a total of forty-six cancer control projects have been approved since last July 1. A total of $766,748 in grants is involved. In addition, three new grants totalling $1,134,368 have been made for cancer research. These go to Emory University, Atlanta, Ga.; the University of Rochester, Rochester, N. Y., and the University of Texas.

ARMY

RESERVE OFFICERS INVITED TO ACTIVE DUTY

In extending an invitation to Medical Department reserve officers to enter on tours of extended active duty, the Surgeon General announced that current requirements total 1,411 officers, who may be called during the month of June. These requirements, he said, are subject to increase in future months with Army expansion. More than half of the total officers required to fulfil the Medical Department quota will be nurses, of whom 320 are needed. The remainder are divided as follows: Dental Corps, 10; Medical Corps, 203; Veterinary Corps, 20; Medical Service Corps, 265, and Women's Medical Service Corps, 75. Virtually all officers to be recalled will be lieutenants and captains.

MEDICAL MEETING IN KOREA

At the monthly medical meeting of officers stationed in Korea at the 71st Station Hospital, May 10, a symposium was presented on the diagnosis and treatment of leprosy by Dr. Paul S. Crane, medical advisor to the Yosu Leprosarium, Southern Presbyterian Mission, and Dr. D. S. Lowe, medical advisor to the Taegu Leprosarium, Northern Presbyterian Mission. During the afternoon the officers were transported to the Pusan Leprosarium, which houses 250 lepers and where the comparative clinical results obtained in patients treated with "promin" (sodium p,p' diaminodiphenylsulfone - N,N didextrose sulfonate), with "diasone" (disodium formaldehyde sulfoxylate diaminodiphenylsulfone) and with chaulmoogra oil were demonstrated. Col. Charles P. Ward, Surgeon, U. S. Army Forces in Korea, presided at the business meeting. The next monthly medical meeting will be held at the 332nd Station Hospital.

PERSONAL

Dr. Lawrence S. Kubie, professor of psychiatry and mental hygiene, Yale University School of Medicine, New Haven, Conn., and Dr. John M. Lyon, professor of psychiatry, University of Colorado Medical School of Denver, have been appointed consultants to the Surgeon General of the Army.

AWARDS AND COMMENDATIONS

Capt. Edwin B. Anderson

The Army Commendation Ribbon was awarded on June 8 to Capt. Edwin B. Anderson, M. C., U.S.A. The citation read in part as follows: For meritorious rendition of services as Assistant Attending Surgeon, Regional and Station Hospital, Maxwell Air Force Base, Montgomery, Ala., from November 1946 to May 1948. Capt. Anderson consistently displayed intelligence, initiative and extremely high devotion to duty. Dr. Anderson graduated from Vanderbilt University School of Medicine in 1945 and entered the military service in July 1946.

NAVY

MEDICAL HISTORY OF WORLD WAR II

Capt. Louis H. Roddis (MC), Chief, Publications Division of the Bureau of Medicine and Surgery, has been invited to the conference of Official Medical Historians Liaison Committee at Oxford, England, August 3-7. The committee is a group of medical historians from various parts of the British Empire engaged in preparing an official medical history of World War II. Invitations have been extended to representatives of the U. S. Army also. The Liaison Committee met in Ottawa, Canada, last year, when Captain Roddis presented the program of the U. S. Navy Medical History. The meetings of the group are called to exchange views and to discuss problems pertinent to the production of the official World War II medical histories of the United States and the British Empire.

OFFICERS APPROVED FOR GRADUATE TRAINING

The Advisory Board of the Bureau of Medicine and Surgery on June 2 approved the following medical officers for postgraduate training:

Capt. Donald E. Dement, course in hazards of nuclear radiation, University of Rochester.

Capt. Edward S. Lowe, course in surgery, University of Pennsylvania.

Comdr. Wallace E. Allen, residency in otolaryngology at the Naval Hospital, Long Beach, Calif.

Comdr. Frank R. Philbrook, course in public health at Harvard University School of Public Health.

Comdr. Robert E. Rock, course in virus diseases at the G. W. Hooper Foundation, University of California Medical School.

Lieut. Comdr. Byron E. Bassham, fellowship at Northwestern University.

Lieut. Caesar F. Orofino, residency training at the Naval Hospital, Long Beach, Calif.

Lieut. (jg) Leland C. Brannon, residency in surgery at a Naval Hospital to be designated.

Lieut. (jg) Neal D. Sanborn, course in general practice at the University of Colorado.

SYMPOSIUM ON ISOTOPES

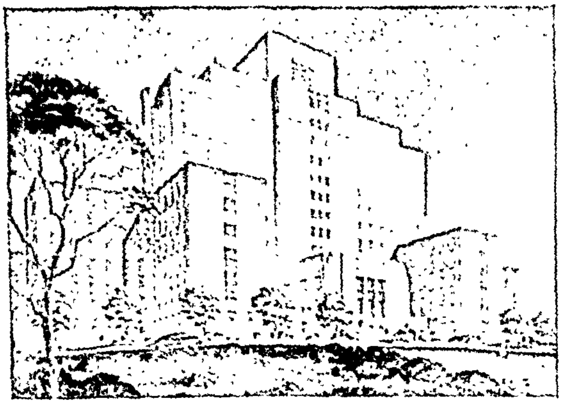
The Bureau of Medicine and Surgery has prepared a Supplement to the Naval Medical Bulletin on the "Preparation and Measurement of Isotopes and Some of Their Medical Aspects." The volume contains papers read at the symposium on isotopes before the division of biological chemistry at the New York meeting of the American Chemical Society in 1947 and two articles by authors from the Medical Department of the Navy. The material is not too far advanced for the ordinary medical reader; it should be interesting, particularly to readers interested in research and in the clinical use of isotopes. The volume may be purchased for 35 cents from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.

PERSONAL

Capt. Charles F. Behrens, commandant of the Naval Medical Research Institute, Bethesda, Md., addressed the Volunteer Medical Reserve Division in Philadelphia, June 15, on "Atomic Energy in Relation to Medicine."

VETERANS ADMINISTRATION

THOUSAND BED HOSPITAL AT NEWARK, N. J.



Veterans' hospital being built at Newark, N. J.

The contract has been awarded and excavation work is under way for the construction of the sixteen story veterans' general hospital at the common boundary of Newark, East Orange and South Orange, N.J. Col. Charles F. Williams, district army engineer of New York, announced that because of consideration of the welfare and comfort of patients, the scientific technical planning and the finest in medical equipment and artistic beauty, this institution will be far in advance of anything that New Jersey has to offer. The site of the hospital is the 35 acre former Bamberger Estate. The main hospital building will be H shaped, sixteen stories high on the east side and thirteen stories above ground on the front. The hospital will be surrounded by a fine residential area. The site is beautifully landscaped, and all existing shrubberies and gardens will be preserved. The main building will have 18 acres of floor space, and to walk around its perimeter would total a half mile. South of the main building will be erected a ten room manager's residence and two duplex cottages of two apartments of six rooms each. The nurses' home will be connected to the main hospital by a service tunnel. An attendants' building is also planned for eighteen single rooms. Living quarters for sixty-seven resident physicians and interns will be on the lower floors of the hospital.

CONTRACTS FOR HOSPITAL

The general construction contract has been awarded for a two hundred and eight bed hospital at Erie, Pa. In addition, other contracts were awarded for the heating system, electrical work and elevators.

PERSONAL

Dr. Edward S. Post, formerly supervisor of veterans' hospitals in the Chicago branch of the Veterans Administration, has been assigned as manager of the 2,400 bed veterans' hospital at Fort Custer, Michigan.

PUBLIC HEALTH SERVICE

FELLOWSHIPS AVAILABLE IN MENTAL HEALTH

The U.S. Public Health Service announces that a limited number of mental hygiene fellowships for graduate work will be awarded. The fellowships are open to psychiatrists, psychologists, social workers and other qualified persons interested in research in mental health. These fellowships will be at the predoctorate and postdoctorate levels, while a special research fellowship will be awarded to applicants who qualify for a postdoctorate fellowship and who in addition have demonstrated outstanding ability or who possess special training; this particular fellowship does not carry a set stipend. The stipends for the various kinds of fellowships vary from $1,200 a year to $3,600, depending on the applicant's qualifications and the number of his dependents. Applicants are required to file a statement outlining the investigation on which they will work. Requests for information should be addressed to Division of Research Grants and Fellowships, National Institute of Health, Bethesda 14, Maryland.

LEADING ACCIDENTAL CAUSES OF DEATH—1946

The Federal Security Administrator announces that the six leading accidental causes of death for 1946, based on a study by the Office of Vital Statistics of the U. S. Public Health Service, were: (1) motor vehicle accidents, 33,411; falls, 22,581; drowning, 5,577; burns (except conflagration), 4,856; conflagration, 3,017; railway accidents (excluding collision with motor vehicles), 2,937; other accidents accounted for 25,654, increasing the total number of deaths from accidents in 1946 to 98,033.

CANCER RESEARCH

The Federal Security Administrator announced March 17 cancer research grants totaling $588,032 to be given to institutions, medical schools and hospitals. The largest sum in this list, $90,960 went to Johns Hopkins University, Baltimore, for investigation of mass roentgenologic methods for the early detection of cancer of the stomach.

MISCELLANEOUS

DR. FAILLA ORGANIZES HEALTH PHYSICS BRANCH

The U.S. Atomic Energy Commission announces that Dr. G. Failla, professor of radiology, Columbia University College of Physicians and Surgeons, New York, has been appointed to organize the health physics branch, division of medicine and biology, for the commission. This branch is concerned with protection of persons from radioactive materials. Dr. Failla during the war was consultant to the Metallurgical Laboratory, University of Chicago, and the Manhattan District; he is now consultant to the U.S. Public Health Service and the Veterans Administration. Dr. Failla was awarded the Leonard prize of the American Roentgen Ray Society in 1923 and 1925, the Janeway medal of the American Radium Society in 1935, and the gold medal of the Radiological Society of North America in 1947.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ALABAMA

Fifty Year Club.—The Medical Association of the State of Alabama this year inaugurated its fifty year club with one hundred and thirty-two members. Physicians who graduated fifty or more years ago were asked to sign the "Fifty Year Club" register. Their names were printed in the program; on the morning of the second day of the annual session recognition of the "Golden Anniversary in the Practice of Medicine" was made and certificates were awarded to those who were present.

CALIFORNIA

Personal.—Dr. Norman C. Paine, Glendale, Calif., former assistant football coach at the University of Chicago, was awarded a citation of merit at the University of Chicago Alumni banquet June 11, in recognition of public service to the community, the nation and humanity. He is a member of the faculty of the University of Southern California School of Medicine, Los Angeles, and a graduate of Rush Medical College, Chicago.

Venereal Disease Demonstration Project.—Santa Clara County is conducting a venereal disease demonstration project sponsored by the Palo Alto City, Santa Clara County, and San Jose City health departments, the county medical society, the state department of public health and the U. S. Public Health Service. The purpose is (1) to demonstrate that strengthening of the private physician and health department relationship is an essential of a sound venereal disease control program and on a continuing basis will result in increasing the number of patients under the care of private physicians and (2) to demonstrate that a public information program integrated with the general health education program and on a continuing basis will result in accelerated case finding both for the private physician and the health departments.

COLORADO

Dr. John Ryan Awarded the Gold-Headed Cane.—In a commencement day ceremony at the University of Colorado School of Medicine, Denver, the Gold-Headed Cane was passed on from Dr. James J. Waring, professor of medicine at the school, to Dr. John G. Ryan, associate professor of medicine, "for his devotion to students and patients over a period of many years." Dr. William J. Kerr, who instituted the gold-headed cane ceremony at the University of California, gave the baccalaureate address on this occasion. His subject was "Immortality of Inspiration." Dr. Ryan, a graduate of Rush Medical College, Chicago, in 1910, and member of Alpha Omega Alpha and Sigma Xi honorary fraternities, has practiced medicine in Denver since returning from service in the Army medical corps in World War I.

A cane with a gold top was, at least in England, an essential part of the physicians' equipment in the eighteenth century. John Radcliffe (1650-1729), who attended King William and Queen Mary, carried such a cane and passed it on to his successor in practice, Richard Mead. The cane was passed down to various successive physicians (Askew, Pitcairn and Baillie), then in the early nineteenth century was deposited in the Royal College of Physicians, where it remains to this day.

Isador H. Coriat of Boston, in his paper on "The Symbolism of the Gold Headed Cane" (*Annals of Medical History*, March 1924, page 126) said, "Thus the gold-headed cane became a sort of symbolic carrier of the power of the physician or the immortal transmitter or bearer of power as it passed from one physician to another." The gold-headed cane ceremony has been instituted at certain medical schools in the United States. Among other physicians who have thus been honored are: George Dock, Pasadena, Calif.; George Blumer, San Marino, Calif.; Herbert C. Moffitt, San Francisco; James B. Herrick and Ernest E. Irons, Chicago; William S. Middleton, Madison, Wis., and James J. Waring, Denver.

CONNECTICUT

Dr. Lindskog Heads Yale Department of Surgery.—Dr. Gustaf E. Lindskog, associate professor of surgery, has been appointed William H. Carmalt professor of surgery and head of the department of surgery, Yale University School of Medicine, New Haven. The professorship was formerly held by Dr. Samuel C. Harvey, now Yale's first professor of surgery in oncology and president of the Connecticut State Medical Society. Dr. Lindskog received his medical degree at Harvard Medical School, Boston, in 1928.

State Diabetes Association.—The Connecticut Diabetes Association, organized last April during the annual meeting of the state medical society, plans for statewide operation next fall. Professional memberships will be open to all physicians, and policy control will be vested in this group. Associate members will include diabetic persons, their relatives and friends, nurses, pharmacists, public health officials, laboratory technicians, social workers, nutritionists and other allied groups. The program of the association is to include education of relatives and friends in the proper care of diabetic patients, standardization of treatment and promotion of the principle of early diagnosis. Officers of the association are: Dr. Barnett Greenhouse, New Haven, president, and Dr. John Dobkins, Stamford, secretary.

DISTRICT OF COLUMBIA

Personal.—Dr. Walter A. Bloedorn, medical director of the George Washington University Hospital, received the honorary degree of doctor of science at convocation exercises at the university March 23.

Dr. Davidson Honored.—At a meeting of the Medical Society of the District of Columbia, April 14, a portrait of Dr. Edward Y. Davidson was unveiled in the society building. The physician was being honored for his service to the society, particularly in relation to the erection of its building, instigated while he was president in 1916 and completed in 1920. Dr. Davidson was present at the ceremonies.

Dr. Rossiter to Retire as Chief of Staff.—It is reported that Dr. Percival S. Rossiter will retire on September 1 as chief of staff at Gallinger Municipal Hospital, a position he has occupied since retiring as Surgeon General in 1938, after serving thirty-five years in the Navy. George Washington and Georgetown universities jointly will nominate the next chief of staff of the hospital. The Rev. Paul A. McNally, S.J., dean of Georgetown Medical School, said, "Dr. Rossiter has made a magnificient contribution to the education of Georgetown men at Gallinger Hospital, and the university is deeply appreciative of his contribution."

Francis R. Hagner Memorial Library.—A group of colleagues and friends recently dedicated the Francis R. Hagner Memorial Library in the room at Garfield Hospital, which was the site of the former solarium. The memorial was planned in 1941, a year after Dr. Hagner's death, but building was delayed by the war. Dr. John H. Cunningham, Boston, unveiled Dr. Hagner's portrait, a gift from the American Genitourinary Association. The hospital has employed a full time medical librarian. The library was formally presented to Garfield Memorial Hospital by the chairman of the memorial committee, Dr. Harry H. Kerr, Washington, and was accepted by Mr. George Dunlop, vice president of the board of directors.

ILLINOIS

Doctor Otten Memorial.—A portrait of Dr. Harry Otten, purchased by members of the staff of Memorial Hospital, Springfield, has been placed in the doctors' lounge. This is the initial action on the proposed Otten Memorial, concerning which a board of trustees has been appointed to recommend the type of memorial to be established. Dr. Otten, who died Feb. 18, 1948, was a member of the executive committee and former president of the medical staff of the hospital.

Chicago

Cancer Clinic for Men.—Chicago's second cancer detection clinic for men opened June 3 at Mercy Hospital and will operate each Thursday. Appointments can be made by calling Whitehall 4373.

Research on Preoperative Preparation.—The University of Illinois College of Medicine has received a grant of $4,500 from Abbott Laboratories for the study of procedures and germicides in the preoperative preparation of surgeon and patient. The investigation is under the direction of Dr. Milan V. Novak, head of the department of bacteriology and public health.

Loyal Davis Heads Passavant Staff.—Dr. Loyal Davis became chief of staff at Passavant Memorial Hospital June 18, succeeding Dr. Howard B. Carroll. Dr. Davis is chairman of the division of surgery at Northwestern University Medical School and is editor of *Surgery, Gynecology, and Obstetrics*. Since 1925 he has been consulting neurologic surgeon at Hines Veterans Hospital.

Society Installs Officers.—At the annual meeting and dinner of the Chicago Medical Society June 16 at the Drake Hotel Dr. J. Roscoe Miller, dean of Northwestern University Medical School, was installed as president. Dr. Willard O. Thompson was made president-elect and Dr. H. Kenneth Scatliff, secretary. Dr. Warren H. Cole gave an address on "Socialized Medicine in England."

Portal House Leased to Committee on Alcoholism.—The city council has leased Portal House, a retraining center for alcoholic addicts, without rental for the rest of 1948 to the Chicago Committee on Alcoholism, headed by Anton J. Carlson, Ph.D., emeritus professor of physiology, University of Chicago School of Medicine. Portal House was organized a year ago and was to have been abandoned June 15 by the city welfare department because of lack of funds. Clients of the welfare department will be treated for $5 a day and outside paying patients for $8 a day.

INDIANA

Social Hygiene Association.—At a meeting in May, Dr. Arthur F. Weyerbacher, Indianapolis, treasurer of the Indiana State Medical Association, was elected president of the newly organized Indiana Social Hygiene Association. Units will be organized in each county. Mrs. A.W. Ratcliffe, Evansville, immediate past president of the Woman's Auxiliary to the state medical association, was named secretary, and Harold B. West, Indianapolis, treasurer.

Conference on School Health.—The committee on school health and physical education of the Indiana State Medical Association will sponsor a conference of physicians, public school executives, health educators and physical education instructors at Indianapolis October 6. The objective will be to bring about better participation by physicians in the school health field. Fred V. Hein, Ph.D., Chicago, Bureau of Health Education, American Medical Association, is assisting the committee in arranging the conference.

LOUISIANA

Society Election.—At the twenty-fourth annual business meeting of the New Orleans Gynecological and Obstetrical Society on May 12, the following officers were installed: Dr. Woodard D. Beacham, president; Dr. Conrad G. Collins, president-elect; Dr. Harry Meyer, secretary, and Dr. Eugene H. Countiss, treasurer.

University Appointments.—G. John Buddingh, formerly professor of bacteriology, Vanderbilt University School of Medicine, Nashville, Tenn., has been appointed professor of microbiology at the Louisiana State University School of Medicine, New Orleans. Other recent appointments to the full time faculty include: Ruth A. Miller, formerly of Johns Hopkins University School of Medicine, Baltimore, as assistant professor of anatomy; William J. Obrinsky, New York, instructor in pediatrics; Thomas Hernandez, New Orleans, instructor in biochemistry; Irving M. Essrig, New Orleans, instructor in surgery; Jack G. Miller, New Orleans, instructor in obstetrics and gynecology.

MINNESOTA

Certificate of Merit.—Drs. Earl H. Wood and Edward H. Lambert, Rochester, received the President's Certificate of Merit on May 18 at a luncheon meeting at the Mayo Foundation House, Rochester. The awards, made by Rear Admiral Frederick L. Conklin, Commandant of the Ninth Naval District, were made in recognition of outstanding services in experimenting with the effects of high acceleration of the human body.

New Head of Bacteriology Department.—Dr. Jerome T. Syverton, professor of microbiology, Louisiana State University School of Medicine, New Orleans, has been appointed professor and head of the department of bacteriology and immunology at the University of Minnesota Medical School, Minneapolis, succeeding the late Dr. Robert G. Green. Dr. Syverton is a graduate of Harvard Medical School, Boston, 1931.

NEW YORK

Public Health Service.—The annual conference of New York State Health Officers and Public Health Nurses is scheduled for July 21-23 at the Grand Union Hotel, Saratoga Springs. The program will emphasize tuberculosis control, nutrition in public health and development of county health departments. Among the speakers will be Dr. Leonard A. Scheele, Surgeon General, U. S. Public Health Service, and Dr. Leo F. Simpson, Rochester, president of the Medical Society of the State of New York.

Community Honors Dr. Smallman.—Citizens of Ellicottville and the surrounding area recently honored Dr. Alfred W. Smallman at a testimonial dinner and reception. Public officials, medical colleagues and business men were among those attending. Dr. Smallman began practice in Ellicottville in 1888. He has been president of the Bank of Ellicottville for sixteen years, was mayor for six years and served thirteen years on the board of education. He was recently honored by the Medical Society of the State of New York for his long service.

New York City

Memorial to Dr. Lewi.—The New York Infirmary has received $14,000 to start an endowment fund in honor of Dr. Emily Lewi, who was a former director of pediatrics at the infirmary. The sum, presented by friends, will support a room in the new infirmary buildings, to be known as the Emily Lewi Memorial Room.

Dr. Browder Director of Department Surgery.- Dr. E. Jefferson Browder will become director of the department of surgery of the Long Island College Hospital July 1, succeeding Dr. Emil Goetsch, who is retiring as director after twenty-nine years of service. Dr. Goetsch will continue as attending surgeon at the hospital and a member of the board of regents. Dr. Browder is at present an attending neurosurgeon at Brooklyn, Methodist and Kings County hospitals and consultant neurosurgeon at other hospitals.

Dr. Van Etten Honored.—On his retirement as chairman of the board of directors of United Medical Service (The Doctor's Plan), Dr. Nathan B. Van Etten, who has served the medical and surgical prepayment plan since its inception, was presented with an illuminated scroll in recognition of the "enduring appreciation and affectionate regard of his fellow directors." The presentation was made by Dr. Charles Gordon Heyd, president, on May 26 at a combined meeting of the board of directors of Associated Hospital Service, New York's Blue Cross Plan and United Medical Service held at the Gramercy Park Hotel, New York.

New Home Care Departments.—To reduce the demand for beds in the city's twenty-four hospitals, a new department of home care is to be established in each hospital to serve persons who no longer need the full run of hospital services and who can recover at home under medical and nursing care. According to Dr. Edward M. Bernecker, hospitals' commissioner, it is planned that Bellevue Hospital, Kings County Hospital and Goldwater Memorial Hospital will be set up to care ultimately for 200 home patients each; that Queens General, Morrisania, Harlem, Lincoln, Fordham, City and Metropolitan hospitals will take care of 100 cases each, and that Coney Island, Greenpoint, Cumberland and Gouverneur Hospitals will take care of 50 home patients each. This is equal to adding 1,500 beds to this department or constructing buildings costing at least $22,000,000. Average cost of the home patient is $2.23 per day, and the average cost in hospital is $9 per day.

OHIO

Cleveland Contributions for Hospital Beds.—The Academy of Medicine of Cleveland recently participated in a drive to raise $9,000,000 to provide additional hospital beds. Setting a goal of $300,000 for themselves, Cleveland physicians found that they had actually donated $419,104.50 when the drive was completed.

Research in Nutrition—The Robert Gould Research Foundation recently made annual grants of $10,000 for a three year period to the University of Cincinnati College of Medicine for promoting research in nutrition. The foundation also gave scientific research equipment and a technical library valued at $25,000.

Alumni Achievement Award.—The first Alumni Achievement Award of the Ohio State University College of Medicine, Columbus, was presented recently to Dr. Verne A. Dodd, professor in the department of surgery at the university and chief of staff of University Hospital, and to Dr. Robert A. Moore, dean of the Washington University School of Medicine, St. Louis.

Academy of General Practice.—Dr Joseph W Lindner, Cincinnati, was elected president of the Ohio Academy of General Practice, March 30, in Cincinnati; other officers elected were: Dr Emery G Kyle, Newton Falls, president-elect; Dr Earl W Burgner, Akron, secretary, and Dr. Henry W. Lehrer, Sandusky, treasurer. Ohio is the twenty-first state to become affiliated with the national organization.

SOUTH CAROLINA

Society News.—At the meeting of the county medical society in Greenville, June 7, Dr. Curtis J. Lund, professor of obstetrics and gynecology, Louisiana State University School of Medicine. New Orleans, spoke on "Recent Advances in the Management of Abortions" and Dr. David F. Watson, Greenville, "Management of the Third Stage of Labor."

Royster Club.—A group of younger physicians in Raleigh have formed a club in honor of Dr. Hubert A. Royster, Raleigh, retired surgeon, who is the honorary president. The club is devoted to medical research, the presentation of original work and the discussion of advanced scientific knowledge. Membership at present is limited to eighteen.

VIRGINIA

Personal.—Dr. Edward J. Van Liere, dean of the West Virginia University School of Medicine, Morgantown, W. Va., was awarded the honorary degree of doctor of letters by the Medical College of Virginia, June 8.

Dr. Porter Goes Abroad.—Dr. William B. Porter, Richmond, left June 9 for London as a representative of the American Medical Association, the American Board of Internal Medicine and the Medical College of Virginia, Richmond, at a meeting of the British Medical Association, June 21-July 2 at Cambridge University, Cambridge, England. After the meeting Dr. Porter will be sent by the U. S. Army Surgeon General on a lecture tour in the United States zone of Germany and Austria. He will also inspect military medical schools in fifteen of the major cities of the two countries and will return to the United States early in August. Dr. Porter served throughout the war and is still serving on the civilian consultant staff for the Surgeon General.

GENERAL

Visiting Orthopedic Surgeons.—Thirteen British orthopedic surgeons are currently visiting medical centers in the United States and Canada on a six week tour sponsored by the American Orthopaedic and Canadian Orthopaedic associations.

Argentina Confers Awards.—Drs. Chevalier Jackson, Philadelphia, and Jacob C. Geiger, Stanford University, Stanford University, San Francisco, were recently honored by Argentina when the Order of San Martin the Liberator was conferred on them.

Chinese College Seeks Scientific Books.—The United Board for Christian Colleges in China, representing thirteen institutions, is attempting to secure up-to-date books for its forty-one colleges, four of which are medical colleges. China has largely depended on these colleges for well trained physicians to staff American missionary hospitals and to promote public health work. The board will pay parcel post charges on any available books.

Coordination of International Congresses.—Representatives of ten organizations met on April 12 in Paris to plan for a bureau to coordinate international congresses as to dates, places, common interest and borderline subjects. Representatives from the following organizations attended the meeting: International Union Against Tuberculosis, International Council of Nurses, International Union Against Venereal Diseases, World Medical Association, International Pediatric Association, International Society of Surgery, International Union Against Cancer, International Congress of Radiology, International Congress on Mental Health and International League Against Rheumatism.

Research in Heart Disease.—An additional $103,000 in research funds for heart disease, including twelve student fellowships, three postgraduate fellowships and nine grants in aid to hospitals and universities, has been announced by the Life Insurance Medical Research Fund, New York. The purpose of the fellowships is to help meet the need for qualified men and women trained in research technics. Student fellowships, amounting to between $1,500 and $1,800, go to students who have not yet received their doctorate degrees and provide for a year's additional undergraduate training under leading scientists. Postgraduate fellowships, amounting to between $2,500 and $4,000, go to graduate workers for similar study. The list of awards is the second announced this year and brings the 1948 allocations to $637,000.

Surgical Society Opposes Resolution of Anesthesiologists.—The American Surgical Association has taken the following action relative to the resolution adopted by the American Society of Anesthesiologists, Inc., June 11, 1947 (THE JOURNAL, August 2, 1947, page 1189) concerning the training of persons other than doctors of medicine as anesthetists. In so far as the resolution pertains to the training and employment of nurses as technicians under competent medical supervision, the American Surgical Association has made its position of record for the following reasons: 1. The number of physician anesthetists trained or at present in training is totally inadequate to carry the present work load of essential surgery. 2. In view of the increased demand for physicians in all branches of medicine, it is improbable that there will be a flow of recent graduates into anesthesiology sufficient to correct this shortage. 3. As a general policy it is safer to employ nurses trained and working under medical supervision than it is to revert to the use of medical graduates without special training and working without specialist supervision. 4. Trained and working under medical supervision, the nurse-technician anesthetist can continue to carry a portion of the work load with full protection to the safety of the patient.

LATIN AMERICA

Congress on Cancer in Havana.—The third National Congress on Cancer was held May 2 in Havana at the new Curie Institute for Cancer, under the presidency of Dr. Rufino Moreno. Among those participating were: Hyman I. Goldstein, Camden, N. J.; Chevalier L. Jackson, Jacques P. Guequierre and Reuben Friedman, Philadelphia; E. W. Alton Ochsner, New Orleans; Charles P. Bailey, Philadelphia; Irving A. Sarot, New York; Henry A. Brodkin and Eugene V. Parsonnet, Newark, N. J.; Michael Scott and Moses Behrend, Philadelphia; Howard W. Jones Jr., Baltimore, and Eugene M. Bricker, St. Louis.

MEXICO

Course in Tropical Dermatology.—Under the auspices of the Sociedad Mexicana de Dermatologia, a second two week course on tropical dermatology will be given August 15-28 in Mexico, D.F., similar to the first course conducted especially for American doctors in 1945 at the request of Dr. Howard Fox, New York, and Dr. Leon Goldman, Cincinnati. The course will include clinical and laboratory features of several dermatologic conditions often seen in tropical America: mal del pinto, onchocerciasis, parasitic diseases of animals, leprosy, deep mycosis, leishmaniasis and chemical control of insects. This course will be limited to American dermatologists and the number of registrations to fifty doctors. The fee will be $100, payable at the time of registration in Mexico, D.F. All written material will be presented in English. Information may be obtained from Dr. Fernando Latapi, Permanent Secretary, Sociedad Mexicana de Dermatologia, Zacatecas 220-6, Mexico City, or Dr. Leon Goldman, Department of Dermatology and Syphilology, College of Medicine, University of Cincinnati, Cincinnati, Ohio.

FOREIGN

World Health Mission to Greece Report.—An emergency program to improve health conditions in the Dodecanese Islands has been mapped by representatives of the World Health Organization Interim Commission's Mission to Greece. According to Dr. J. Miller Vine, Grimsby, Lincolnshire, England, who was responsible for a survey made in recent weeks, tuberculosis is the most serious health problem on the islands. An extensive program of organizing health centers and dispensaries on the main islands of the Dodecanese group is immediately necessary, Dr. Vine said. It is planned now to set up a public health center with five clinical sections on the three islands of Rhodes, Cos and Colymnos, as well as a mass x-ray program for Rhodes. Malaria was an extremely serious problem until DDT spraying was introduced by the World Health Organization in 1947; the incidence was then reduced by more than 80 per cent, according to the report. In Greece proper forty-five tuberculosis dispensaries and two mass x-ray centers have been put into operation under the tuberculosis program. Despite the efforts of the Greek staff and of the health mission, only twenty-five of the forty-five dispensaries are reported to be functioning satisfactorily. Economic difficulties, lack of trained personnel and the civil war are continuing to hamper the health program in Greece. The first semirural center for mass x-ray is now being installed in Elefsis Sanatorium. Personnel of the Interim Commission are helping to operate the center during the first three months and are training Greek staff members to continue the work. Col. D. E. Wright, chief sanitary engineer of the World Health Organization, who is in charge of the malaria and sanitation programs, has announced the purchase of additional aircraft for use in DDT spraying.

Marriages

NATHAN RALPH to Dr. ALICE LESCHIN GROSS, both of Philadelphia, April 4.

WILLIAM BRODHEAD GEORGE, Verona, N. Y., to Miss Mary Casham Mills in Irondequoit, April 10.

ROBERT NELSON RICKETTS, Oil City, Pa., to Miss Jane Forsyth at Seminole, Fla., April 17.

LOUIS JACKSON FRYMIRE to Miss Louise McCalmont, both of Pittsburgh, recently.

GARTH KINSEY GRAHAM, Elmhurst, Ill., to Miss Jeanne Natalie Williams of Lynn, Mass., May 22.

DUDLEY PENNINGTON JACKSON, Baltimore, to Miss Ada Patricia Custer of Ashland, Va., May 15.

WILLIAM HARRISON HIGGINS to Miss Emily Armistead Peyton, both of Richmond, Va., May 29.

FRANKLIN TALMADGE BUCHANAN, Bristol, Va., to Miss Marjorie Ann Haas in Akron, Ohio, May 29.

JAMES JOSEPH FINNERTY, New York, to Miss Anna Lowell Putnam of Springfield, Mass., April 8.

LLOYD LAGERQUIST, East Providence, R.I., to Miss Barbara Marilyn Drummond at Barrington, May 8.

JOHN CALHOUN RISHER to Miss Anne Hume Nash, both of Charlottesville, Va., April 10.

Deaths

Charles Albert Elsberg ⊕ died at his home in Stamford, Conn., March 18, aged 76, of coronary heart disease. Dr. Elsberg was born in New York on Aug. 24, 1871. He graduated from the College of Physicians and Surgeons, medical department of Columbia College, New York, and began to practice in New York in 1893. In 1909 he was one of the founders of the New York Neurological Institute, where he became chief of the neurologic service and, at the time of his death, emeritus chief. He was an emeritus professor of neurologic surgery at his alma mater and formerly professor of neurologic surgery at the New York Post-Graduate Medical School and Hospital, Columbia University. He was a fellow of the American College of Surgeons, member and past president of the American Neurological Association, a member of the Society of Neurological Surgeons, the Association for Research in Nervous and Mental Diseases and the American Association for the Advancement of Science. He was an honorary member of the Société Internationale de Chirurgie and the Società Radio-neuro-chirurgical Italiana. During World War I, Dr. Elsberg was requested by the Surgeon General of the Army to organize in New York a school for instruction in neurosurgery and was designated as military director of the institution. He was consultant surgeon at the Vassar Brothers Hospital in Poughkeepsie, Flower and Fifth Avenue Hospital, Knickerbocker, Montefiore and Mount Sinai hospitals. In 1938 he delivered the eighth Walter M. Brickner Lecture at the Hospital for Joint Diseases. He was a recipient of the Harsen Clinical Prize and Medal of Columbia University and also received the Townsend Harris Medal offered by alumni of City College. When City College celebrated its hundredth anniversary, an honorary doctorate was conferred on Dr. Elsberg. On his sixty-fifth birthday the medical staff of the New York Neurological Institute presented him with a special volume of the bulletin of the institute, containing forty original articles contributed by his colleagues and students.

Cullen Francis Welty, San Francisco; University of Pennsylvania Department of Medicine, Philadelphia, 1890; specialist certified by the American Board of Otolaryngology; member of the American Medical Association; member and past president of the San Francisco County Medical Society and of the Pacific Coast Oto-Ophthalmological Society; fellow of the American College of Surgeons; served on the staff of the San Francisco Polyclinic; died in Franklin Hospital March 8, aged 82.

William Rudisel Fringer ⊕ Rockford, Ill.; Chicago Medical College, 1888; past president of the Winnebago County Medical Society; member of the American Academy of Ophthalmology and Oto-laryngology and the Chicago Ophthalmological Society; specialist certified by the American Board of Ophthalmology; fellow of the American College of Surgeons; served during World War I; for many years on the staff of the Rockford Memorial Hospital; died March 7, aged 34, of cerebral thrombosis.

George Clifford Gould, Mount Vernon, N. Y.; born Oct. 15, 1879; Columbia University College of Physicians and Surgeons, New York, 1903; member of the American Medical Association; fellow of the American College of Surgeons; formerly on the staff of the Manhattan Eye, Ear, Nose and Throat Hospital in New York; for many years associated with Mount Vernon Hospital; died in the Neurological Institute of the Columbia Presbyterian Medical Center, New York, March 26, aged 68, of brain tumor.

Edwin Rahn Fleming ⊕ Medford, Mass.; Jefferson Medical College of Philadelphia, 1904; member of the New England Obstetrical and Gynecological Society; specialist certified by the American Board of Obstetrics and Gynecology; affiliated with the Charles Choate Memorial Hospital, Woburn, and the New England Sanitarium and Hospital in Melrose; consulting obstetrician and gynecologist at the Lawrence Memorial Hospital; died March 4, aged 68, of cerebral hemorrhage.

Henry Randel Baremore Jr., ⊕ Akron, Ohio; University of Vermont College of Medicine, Burlington, 1913; an officer serving overseas during World War I; served on the staff of the City Hospital, where he died March 4, aged 60.

Ellsworth Francis Brandon, Edon, Ohio; Michigan College of Medicine and Surgery, Detroit, 1900; died in Blythe, Calif., March 10, aged 73, of coronary occlusion.

Paul Frederick Bremer, Philadelphia; Temple University School of Medicine, Philadelphia, 1906; died March 3, aged 69.

Arthur H. Brown, Oswego, S. C.; Medical College of the State of South Carolina, Charleston, 1900; died in the Tuomey Hospital, Sumter, March 6, aged 76.

Walter Herbert Brown, Youngwood, Pa.; University of Maryland School of Medicine, Baltimore, 1889; member of the American Medical Association; died March 4, aged 79, of coronary artery disease.

John Norris Bull, Plainville, Conn.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1878; member of the American Medical Association; for many years health officer; died March 7, aged 91.

Christian Frederick Carstens ⊕ Hibbing, Minn.; Johns Hopkins University School of Medicine, Baltimore, 1908; served as village and township health officer; during World War I served in the medical officers' training camp at Fort Riley, Kan.; on the staff of Hibbing General Hospital, where he died February 19, aged 68, of cerebral hemorrhage.

Malcolm Hugh Clark, De Kalb, Miss.; University of Nashville (Tenn.) Medical Department, 1899; died in the Anderson Infirmary, Meridian, March 9, aged 71, of hemorrhages from gastric ulcers.

James W. Coon, Des Moines; Physio-Medical College of Indiana, Indianapolis, 1891; College of Medicine and Surgery (Physio-Medical) Chicago, 1904; member of the American Medical Association and the Missouri State Medical Association; died February 14, aged 84, of cerebral hemorrhage.

George W. Crock, Vicksburg, Miss.; Hahnemann Medical College and Hospital of Philadelphia, 1889; died in the Vicksburg Hospital March 2, aged 80, of carcinoma.

Henry Glover Davis, Franklin, Ind.; Ensworth Medical College, St. Joseph, 1909; died March 4, aged 65.

John Lewis Davis, Gordo, Ala.; University of Nashville (Tenn.) Medical Department, 1891; Vanderbilt University School of Medicine, Nashville, 1891; for many years mayor of Gordo; member of the American Medical Association; died March 2, aged 81, of coronary thrombosis.

Florence Le Verne Eby, New York; Loyola University School of Medicine, Chicago, 1945; certified by the National Board of Medical Examiners; interned at the Ellis Hospital in Schenectady; served a residency at the Willard Parker Hospital and New York Post Graduate Medical School and Hospital in New York; killed March 7, aged 26, when a tractor trailer truck skidded into the automobile in which she was riding.

Frederick Luther Everett, Springfield, Mass.; Cornell University Medical College, New York, 1902; member of the American Medical Association; died in a hospital at Watertown, N.Y., March 6, aged 75.

Samuel D. Fry, Ladonia, Texas; Louisville, (Ky) Medical College, 1890; member of the American Medical Association; died February 27, aged 81, of of diabetes mellitus and heart disease.

Philip J. Genthner ⊕ Brooklyn; University of the City of New York Medical Department, 1886; died March 9, aged 85.

Bruce Lock Gilfillan ⊕ Keokuk, Iowa; Keokuk (Ia.) Medical College, College of Physicians and Surgeons, 1908; served during World War I; colonel, medical reserve corps, not on active duty; died March 6, aged 64, of coronary occlusion.

Lewis H. Graves, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1906; associated with the staff of the Stetson Hospital; died March 19, aged 66.

Eugene Everett Hamilton ⊕ Dayton, Ind.; Medical College of Indiana, Indianapolis, 1903; served as health officer of Grant County, N.D.; died March 9, aged 69.

Charles P. Harshbarger ⊕ Port Republic, Va.; Kentucky School of Medicine, Louisville, 1892; member of the county school board; associated with Rockingham Memorial Hospital, Harrisonburg; trustee of the Bridgewater (Va.) College; director of Rockingham National Bank; died March 22, aged 80, of coronary thrombosis.

Emanuel Alexander Henkle, New London, Conn.; Cornell University Medical College, New York, 1899; member of the American Medical Association; died February 26, aged 73, of carcinoma.

William Yetter Herrick ⊕ Wakeeney, Kan.; Keokuk Medical College, College of Physicians and Surgeons, 1901; *for many years county health officer*; city councilman; surgeon for the Union Pacific Railroad; examiner for draftees during World War I and II; died in Hadley Memorial Hospital, Hays, March 9, aged 77, of cerebral hemorrhage.

Clyde B. Hoffman ⊕ Kent, Wash.; Rush Medical College, Chicago, 1901; died March 5, aged 77, of heart disease.

Hiram D. La Plant, Waverly, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1891; died in Robert Packer Hospital, Sayre, March 5, aged 88.

John Francis Loomis, Marion, Ind.; Cincinnati College of Medicine and Surgery, 1890; member of the American Medical Association; past president of the Grant County Medical Society; formerly county coroner; served on the staff of Grant County Memorial Hospital; died in St. Petersburg, Fla., March 3, aged 83, of pulmonary embolus, following a fractured hip received in a fall.

Thomas B. Loughlen, Olean, N.Y.; University of Buffalo School of Medicine, 1890; member of the American Medical Association; affiliated with the Olean General Hospital; died February 25, aged 79, of a skull fracture received in a fall and cerebral embolism.

John A. McWilliams, Bucklin, Mo.; College of Physicians and Surgeons, Keokuk, Iowa, 1881; died in St. Francis Hospital, Marceline, Mo., March 7, aged 90, of bronchopneumonia.

Theodore Maddux, Union, S.C.; Atlanta College of Physicians and Surgeons, 1902; member of the American Medical Association; served during World War I; died in Aston Park Hospital, Asheville, N. C., March 12, aged 73, of carcinoma.

Robert Bascom Miller, Goldsboro, N.C.; Medical College of Virginia, Richmond, 1898; member of the American Medical Association; past president of the Wayne County Medical Society; examiner for the draft board during World Wars I and II; affiliated with the Goldsboro Hospital; died March 6, aged 71, of heart disease.

Granderson Edgar Mitchell, Reed, Ky.; Kentucky School of Medicine, Louisville, 1898; member of the American Medical Association; died in a hospital at Henderson March 2, aged 77.

Leo Patrick Mooney ⊕ Graceville, Minn.; University of Minnesota Medical School, Minneapolis, 1927; died March 12, aged 51.

Leonard J. Munson, Wilmette, Ill.; Jenner Medical College, Chicago, 1906; formerly head of the medical bureau of Marshall Field & Company in Chicago; died in St. Luke's Hospital, Chicago, March 13, aged 72, of myocardial infarction.

Harry Willard Nichols, Brooklyn; Long Island College Hospital, Brooklyn, 1897; member of the American Medical Association; affiliated with St. John's and Long Island College Hospitals; died in the Methodist Hospital March 6, aged 71, of cerebral accident.

James Pratt Northrop ⊕ Picayune, Miss.; Tulane University of Louisiana School of Medicine, New Orleans, 1940; affiliated with the Martin Sanatorium; died March 2, aged 33, of an accidental gunshot wound.

John Charles O'Brien ⊕ Greenfield, Mass.; University of Vermont College of Medicine, Burlington, 1887; an Affiliate Fellow of the American Medical Association; on the staff of Farren Memorial Hospital, Montague City, where he died March 18, aged 84, of uremia and arteriosclerosis.

Charles Ralph Ozias, Kansas City, Mo.; University of Oklahoma School of Medicine, Oklahoma City, 1914; served during World War I as an officer in the regular army; died March 10, aged 56.

Azro John Pardee ⊕ Ashtabula, Ohio; Cleveland-Pulte Medical College, 1912; formerly city health officer; served as medical officer in charge of the U. S. Public Health Service Relief Station, on the staff of the Ashtabula General Hospital, died January 18, aged 62.

Noah G. Pirkle, Buford, Ga.; University of the South Medical Department, Sewanee, Tenn., 1898; died January 5, aged 75.

Abraham Potasnic, Meridian, Miss.; Mississippi Medical College, Meridian, 1911; died January 7, aged 56.

Dalton Harbord Ray, Mayfield, Ky.; University of Louisville Medical Department, 1907; member of the American Medical Association; president of the Graves County Medical Society; an officer during World War I; served as city and county physician; died January 23, aged 64.

Allen Pierce Richmond, Hingham, Mass.; Bellevue Hospital Medical College, New York, 1889; member of the American Medical Association and the New Hampshire Medical Society; for many years practiced in Dover, N.H., where he was on the staffs of Hayes and Wentworth hospitals; died March 17, aged 87, of chronic myocarditis.

Carl James Robertson ⊕ Captain, U. S. Navy, retired, Coronado, Calif.: Detroit College of Medicine and Surgery, 1916; entered the U. S. Navy on Nov. 1, 1920, and retired March 1, 1941, for incapacity resulting from an incident of service recalled to active duty during World War II; fellow of the American College of Surgeons; died in the U. S. Naval Hospital, San Diego, February 16, aged 56, of hypertensive heart disease.

Samuel Herbert Rutledge, Rogers City, Mich.; Queen's University Faculty of Medicine, Kingston, Ontario, Canada, 1904; member of the American Medical Association; owner of the Rogers City Hospital; died recently, aged 69, of Parkinson's disease.

N. Louis Schappert ⊕ Wilkes-Barre, Pa.; Medico-Chirurgical College of Philadelphia, 1896; past president of Luzerne County Medical Society; member of the American Academy of Ophthalmology and Oto-Laryngology; fellow of the American College of Surgeons; on the staff of Wilkes-Barre General Hospital; died March 9, aged 71.

Aaron Franklin Schmitt, Minneapolis; Rush Medical College, Chicago, 1902; member of the American Medical Association; past president of the Southern Minnesota Medical Association; formerly member of the state board of medical examiners; fellow of the American College of Surgeons; died March 15, aged 78, of coronary disease.

Max Seide, Brooklyn; New York Homeopathic Medical College and Hospital, New York, 1927; medical superintendent of the Cumberland Hospital; formerly deputy medical superintendent and superintendent of Coney Island Hospital; served in the medical corps of the Austrian Army during World War I; died February 23, aged 49, of coronary occlusion and diabetes mellitus.

Louis M. Smirnow, Brooklyn; Yale University School of Medicine, New Haven, 1895; member of the American Medical Association; died February 23 aged 73.

John Fogg Smith, Paulsboro, N.J.; University of Pennsylvania Department of Medicine, Philadelphia, 1900; died February 23, aged 74, of cerebral hemorrhage, hypertension and chronic interstitial nephritis.

S.F. Smith, Glennville, Ga.; University of Georgia Medical Department, Augusta, 1902; died February 19, aged 73.

Carl Louis Spohr, Columbus, Ohio; Starling Medical College, Columbus, 1895; member of the American Association; emeritus clinical professor of pathology at the Ohio State University College of Medicine; affiliated with the University, St. Francis and Children's hospitals; died March 8, aged 77, of cerebral hemorrhage.

Dudley Stennis, Newton, Miss.; University of Nashville (Tenn.) Medical Department, 1900; member of the American Medical Association; affiliated with the Newton Hospital, where he died February 26, aged 72, of coronary occlusion.

Franz O. Stern, St. Louis; Julius-Maximilians-Universitat Medizinische Fakultat, Wurzburg, Bavaria, Germany, 1932; member of the American Medical Association; affiliated with the Jewish Hospital, where he died February 25, aged 40, of arteriosclerosis.

Frank Adolph St. Sure ⊕ San Diego, Calif.; Rush Medical College, Chicago, 1909; died January 24, aged 67, of cerebral hemorrhage, hypertension, generalized arteriosclerosis and bronchopneumonia.

Ross Oren Taylor, San Diego, Calif.; University of Illinois College of Medicine, Chicago, 1912; member of the American Medical Association; died February 25, aged 59, of acute left ventricular failure and myocarditis.

George Alton Tibbetts ⊕ Portland, Me.; Medical School of Maine, Portland, 1915; fellow of the American College of Surgeons; past president of the Cumberland County Medical Society; member of the New England Surgical Society; served overseas during World War I; for many years on the staff of Maine General Hospital; died February 21, aged 61, of coronary thrombosis

John Robert Tobin, Elgin, Ill.; Rush Medical College, Chicago, 1901; member of the American Medical Association; fellow of the American College of Surgeons; affiliated with Sherman and St. Joseph's hospitals; died February 23, aged 71, of carcinoma of the colon and diabetes mellitus.

Charles Holmes Traber ⊕ Reedley, Calif.; Chicago College of Medicine and Surgery, 1913; formerly mayor; affiliated with the Reedley Hospital; died March 19, aged 74, of cerebral hemorrhage.

John Trotter ⊕ Troy, N.Y.; University of Vermont College of Medicine, Burlington, 1898; fellow of American College of Surgeons; formerly vice president of the Vermont State Medical Society; affiliated with the Samaritan Hospital and Troy Orphan Asylum; died February 28, aged 73, of coronary thrombosis.

Wilfrid Trudeau, Fall River, Mass.; Victoria University Medical Department, Coburg, Ontario, Canada, 1884; died February 28, aged 88, of arteriosclerotic heart disease.

James W. Twitchell, Belleville, Ill.; Marion-Sims College of Medicine, St. Louis. 1898; member of the American Medical Association; affiliated with St. Elizabeth Hospital, where he died March 11, aged 78, of heart disease.

Harry D. Vail, Seattle; Western Reserve University Medical Department, Cleveland, 1903; at one time practiced in Quincy, where he served as county coroner and as mayor; died February 24, aged 71.

Luther Edgar Vincent, St. Louis; Meharry Medical College, Nashville, Tenn., 1917; affiliated with Peoples and St. Mary's Infirmary; died February 18, aged 64, of cardionephritis.

Henry Morris Weisman ⊕ New York; University and Bellevue Hospital Medical College, New York, 1910; chief pediatrician at the Bronx Hospital; formerly associate pediatrician in the outpatient department at Mount Sinai Hospital; died March 16, aged 63, of arteriosclerotic heart disease.

Alexander A. Whamond, Chicago; Rush Medical College, Chicago, 1896; member of the American Medical Association; died in the Norwegian-American Hospital March 7, aged 77, of diabetes mellitus and coronary thrombosis.

John Emerson Whitehill, South Bend, Ind.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1907; member of the American Medical Association; died March 23, aged 63.

Charles LaFayette Williams, Independence, Kan.; Northwestern University Medical School, Chicago, 1900; served on the staffs of Christ Hospital, Topeka, St. Anthony Hospital, Dodge City and Mercy Hospital; died in Huntington Station, Long Island, N.Y., March 1, aged 79, of a fractured femur, diabetes mellitus and nephritis.

Harley Arthur Williams ⊕ Cleveland; Western Reserve University School of Medicine, Cleveland, 1929; assistant clinical professor of medicine at his alma mater; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; associated with University Hospitals; died March 5, aged 47.

Julia L. Woodzicka, Royalton, Wis.; Northwestern University Woman's Medical School, Chicago, 1899; died in Waupaca, February 22, aged 82.

Gordon Dulin Wright, St. Joseph, Mo.; University Medical College of Kansas City, Mo., 1898; member of the American Medical Association; affiliated with the Missouri Methodist and St. Joseph's hospitals; died February 27. aged 76, of heart disease.

The British Medical Association Accepts the National Health Service

A meeting of the Representative Body of the British Medical Association has accepted the National Health Service scheme of the Government by a majority of 167 votes to 148. As the minority was so large, requiring only 10 votes to be converted into a majority, the opposition was very strong. The chairman, Dr. Dain, moved that in spite of the insufficiency of the safeguards and the misgivings of a substantial section of the profession the Representative Body is prepared to advise the profession to cooperate in the new service on the understanding that the Minister will continue negotiations on outstanding matters. The concessions made by the minister, he said, went a long way toward establishing the freedoms thought by the profession to be essential. It was necessary to face the fact that a cleavage of opinion existed. He hoped that the members would stand together. An amendment was offered to advise the profession to cooperate in the new service only on condition that the results of continued discussion were concrete and acceptable to all sections of the profession. The Minister said that they were free to join the service or remain outside; but he was using the big stick by refusing compensation for loss of the right to sell practices unless doctors signed on the dotted line by July 5. "Sign or starve" was a strange interpretation of the word freedom. Lord Horder, in supporting the amendment, referred to the chairman's appeal for unity. It would not help any of them to be together if they sank. A few persons still swimming were better than the whole number drowned. It was fear of loss of compensation which caused men and women to sign. He appealed for resistance, which would grow and eventually succeed against defeatism. Replying, the chairman denied defeat and said that the profession had gained a great victory over the Government. It was no use talking about fighting when 26 per cent of the practitioners under the previous National Health Insurance Act in England and 36 per cent in Scotland had already accepted. The amendment was defeated. As stated above, the meeting accepted the National Health Service by a small majority – a result which no one can regard as satisfactory, particularly when the fact is taken into account that acceptance was largely the result of fear and did not indicate approval of the Act. Moreover, the plebiscite showed disapproval of the Act by a large majority of the profession, but not so great as the British Medical Association laid down as the condition for refusal to cooperate.

Lord Horder on the Socializing of Medicine

In previous letters to THE JOURNAL it was pointed out that in the struggle over the National Health Service the negotiators for the profession, while fighting about details, had failed to make any stand in regard to the fundamental evil—the socializing of the whole practice of medicine. At last this evil has been emphasized in an address to the Society of Individualists by Lord Horder. He said that the taking over of Medicine by the State would be as disastrous as was the domination by the Church in the Middle Ages—a greater disaster because at least the Church was cultured. The boot of bureaucratic control threatened to stamp on a plant whose development is so little understood "We have not won this fight" he said, "but we have not lost it. I propose to persist in it, and there are many with me in this, men and women of my own calling. So long as the Minister of Health possesses such tremendous power he can turn the screw on the economic or administrative side of the machine, until the doctors' freedom or the freedom of medicine is entirely lost."

The Treatment of Spastic Paralysis in Children

At a meeting organized by the British Council for the Welfare of Spastics on the Medical, Educational and Social Aspects of the Cerebral Palsy Problem, Professor Alan Moncrieff opened the discussion. He said that American figures suggested that there might be between 600 and 700 children up to the age of 16 with cerebral palsy in every million of population who could be trained to various degrees of efficiency, but British surveys were not yet complete. Treatment comprised specialized physical therapy and occupational therapy, training in correct speech and instruction of parents on how to get the best out of their crippled children. Three types of organization were required—diagnostic and instructional centers for outpatients, inpatient residential units for the severer types and schools for the physically handicapped with visiting instructors.

A New Test in Liver Diseases

At a meeting of the National Academy of Medicine, Professor M Loeper presented a new test which makes possible an estimate of the action of the liver in the acid-base regulation and especially in the destruction of the fatty ketogenic acids. The author has made a study of the alkaline reserve in 40 persons with hepatic disease, serious in 20 of them. The acid-base unbalance is, he says, in proportion to alteration of the cells Since sodium salicylate initiates in most patients an unnoticeable lowering of alkaline reserve of 4 to 5 volumes per cent, the author used this product as a test of hepatic insufficiency. He gave this salt for two days to 40 patients and found that the alkaline reserve falls more with hepatic disease than with normality; the discrepancies between initial figures and those following the administration of sodium salicylate are from 8 to 14 volumes. The decrease is more noticeable in cirrhotic persons and in subjects with large neoplasms and acute icterus. The effect of sodium salicylate can be lessened by the simultaneous administration of hepatic extracts, insulin and sulfur. Loeper and Parrod reported previously their research on the innocuity of salicylsulfuric acid, which does not produce the same variation of alkaline reserve or the same clinical signs of intoxication as pure salicylate. The salicylic test not only provides a means to measure the function of the liver and its cellular activity but brings a new element in the prognosis of hepatic diseases and indicates the value of a therapy with liver extracts, sugar and sulfur.

First International Congress of the Surgical Film

The first International Congress of the Surgical Film was held April 7 in Paris under the presidency of the Minister of Public Health and the patronage of the dean of the Paris Faculty of Medicine. Over 2,500 persons attended. Great Britain presented a sound film by Professor Stanford on the surgical treatment of the blue disease (persistency of Botalli's duct); the United States, a sound color film on anesthesia with curare; the Soviet, the surgical realization of artificial esophagus in patients with gastric fistulas by Professor Youdine; Switzerland, Bacht's obstetric maneuver; France, lumbodorsal sympathectomy according to Smithwick's process, subtotal colectomy, commented on by Professor Patel; surgical treatment of cancer of the larynx, commented on by Professor Portmann; surgical treatment of sciatica by Professor de Seze; surgical treatment of cancer of the rectum by Professor d' Allaines. Dr. Cherigie commented on a film representing an operation on his own hand, which had been injured in an airplane accident, performed by Dr Sterling Bunnel of San Francisco.

Modifications of Bacteria by Penicillin

A. Boivin, E Tulasne, R. Vendrely and R. Minck have succeeded in rendering visible the nucleus of numerous bacteria and cocci by means of a special staining process. After fixation, treatment by ribonuclease to eliminate the ribonucleic acid of the cytoplasm and staining with Giemsa's stain, the nucleus alone remained basophilic on account of the desoxyribonucleic acid it contains. With this staining method the authors have been able to observe the mechanism of action of penicillin. A strain of Staphylococcus aureus and Bacillus coli cultivated on ordinary gelose always appeared uniformly basophilic with direct staining; ribonuclease shows in B coli sometimes two to three nuclei, in the staphylococcus one to three nuclei. Staphylococcus cultivated in the presence of 0.075 penicillin units per cubic centimeter and B. coli cultivated in the presence of 300 units per cubic centimeter do not appear uniformly basophilic in any phase with direct staining. In the latent phase they are larger, especially the colon bacilli, which continue to grow in length, forming long threads (scores to hundreds of microns) with active multiplication of their nuclei (scores to hundreds). On certain points, ribonuclease shows abundant nuclear matter (desoxyribonucleic acid) appearing in various forms. In the staphylococcus under the influence of penicillin ribonuclease shows three to five nuclei per cocci in the latent phase. After a longer conctact with penicillin, staphylococci and B. coli undergo lysis. The authors conclude that penicillin, at the beginning of its action, does not hinder the nuclear division of microbes but restrains the cytoplasmic division.

BUENOS AIRES

A New Antibiotic

The Argentine Ministry of Agriculture announces a new antibiotic of the group of organisms which produce streptomycin. The agricultural engineer Augusto P. Cercós, working with Septoria Nodorum Berk on a fungus which causes a serious disease of crops, observed an infection of their cultures by a micro-organism coming from the air and that the colonies it produced had a great antibiotic effect on certain bacilli. The fungus was cultured and found to belong to the Actinomyces group. The active substance which was extracted is extremely heat resistant, easy to produce and extract and has an intense inhibitory action on some gram-positive bacilli and a minor but still appreciable action on gram-negative bacilli, some of which are pathogenic for plants. The new antibiotic is called "actinomicelina," and experiments with bacteria which infect man have been initiated.

New Plan For The Medical Curriculum

The new plan elaborated by a special commission of eleven professors of the Medical Faculty of Buenos Aires aims to diminish the theoretical and to intensify the practical studies, to reintroduce the compulsory internship and to require the doctoral thesis before a jury. The plan becomes effective immediately. Topographic anatomy has been eliminated; physiology has been divided into physiology proper, biologic physics and biologic chemistry. In the specialties, dermatology and venereal diseases, ophthalmology, otorhinolaryngology, gynecology, urology, psychiatry and pathology of tuberculosis, the examinations have been eliminated and a certificate of the professor who is responsible for the practical studies has been substituted.

The student can undertake the studies of the following year only after having passed completely the examinations of the preceding year. The certificates for practical studies are valid only for two years, so that students must continue their studies without interruption, as some did for personal or economic reasons. The school year has thirty weeks. The distribution of theoretical and practical classes during the year also has been reorganized. The hours per week vary in the six different years, from 22 to 29, and annually from 675 to 877.

During the one year compulsory internship after the examination on clinical medicine has been passed, the daily work is at least six hours, and assistance on an obstetric service, for two and one-half months, is compulsory. The study of medicine comprehends, including the practical year, seven years; i.e., as much time as it did before, when the practical year did not exist.

Paroxysmal Ventricular Tachycardia

The various causes of ventricular tachycardia, its prognosis and treatment and the modifications observed in the electrocardiogram induced Dr. F. C. Arrillaga, at the Medical Faculty of Buenos Aires, and Dr. L. de Soldati to study a group of 4 patients. Most of the paroxysms observed (three in 1 patient, one in another) could be controlled. In all of them the electrocardiographic post-tachycardiac syndrome observed consisted in a depression of the ST segment, negativity of the T wave and (less frequently) a lengthening of the Q-T interval. The post-tachycardiac syndrome assumed different characteristics, depending on the direction of the electric axis during paroxysm, i.e., according to the location of the focus which originated the stimuli. The syndrome was reversible in a short time in one case. In another case it persisted more than two months, one reason which induced them to consider that it is due to ischemia of the myocardium.

Practically all drugs known as efficient were administered in treating these patients. The only really active drug, however, was quinidine, particularly when given intravenously. One patient whose condition was refractory even to large doses of quinidine reacted well after receiving a large dose of digitalis intravenously ninety minutes beforehand. The authors concluded that a great percentage of patients suffering from paroxysmal ventricular tachycardia do not suffer from earlier organic cardiopathy, which may develop afterward. The absence of cardiopathy does not necessarily modify the usually serious prognosis, which to a certain degree is not related to the duration of the paroxysm.

Correspondence

MEDICAL CONDITIONS IN GREECE

To the Editor:—The Medical Mission of the Unitarian Service Committee after a month in Greece is nearing the end of its stay in that country. The Mission includes two internists (P. D. White, chairman, and C. M. Jones), a pediatrician (E. L. Pratt), a surgeon (E. L. Howes), a neurosurgeon (A. R. Elvidge), and an anesthetist (R. D. Dripps), two dentists and oral surgeons (R. F. Sognnaes and H. De Wilde), and a pharmacologist (H. B. Van Dyke), bacteriologist (A. M. Pappenheimer Jr.) and physiologist (R. W. Gerard). Since the entire group meets daily to discuss the varied experiences of the men, a fairly complete coverage has been achieved.

The two medical schools are at Athens and Salonika, the latter only five years old in a young university. The continued wars which have ravaged this unfortunate land have left heavy imprints on the universities and hospitals. Several important buildings were badly damaged by the Germans, and even more by the guerilla fighting; many are still pock-marked with bullet hits. Equipment was mostly destroyed or lost. Much of the space of the preclinical science buildings in Athens is still transformed into a busy military hospital handling some 50 new casualties a week in its three hundred beds, with a mortality of 1.5 per cent. (Incidentally, land mines laid by the guerillas are responsible for many casualties, especially blindness and amputations.) Also, many of the physicians are removed from teaching and practice by needed army service. The inflation has impoverished the academic teachers. Consequently, medical science is only slowly struggling up from complete inactivity. Yet a small number of able and energetic men remains active, and it is heartening to see some significant research in progress.

The peak of the postwar tide forced 1,300 freshmen medical students on Athens (and 1,800 on the one dental school, also there), and even this year there are classes of over 300 at Athens and 200 at Salonika. Two hundred graduates a year would meet the needs of the country, and, despite great efforts, the press of students is preventing their obtaining a satisfactory preclinical experience. Students may even be taking surgery before anatomy. Hospital facilities are also strained to the limit, with only 8,000 beds available in the Athens area for a population of 1,500,000, and new buildings, nurse training and the like have high priority.

Hospital and clinic practice, at least by the recognized physicians and surgeons, is at a high level. The doctors have well developed clinical skill and, even with limited facilities for roentgenologic, clinical and other laboratory services, make good diagnoses. Technical surgical work is excellent, especially in gastric resection, which is the treatment of choice for the very prevalent peptic ulcers. Plastic and intrathoracic surgery is less well developed. Preoperative and postoperative care is more limited than at home, and anesthesia as a medical specialty is still unknown. Measures to relieve pain in childbirth are seldom used. The solicitude for a patient's comfort, psychologic state and general welfare is also — as elsewhere in central Europe — less developed than with us, with our acute consciousness of the individual. The 2,500 monks of Mount Athos are essentially without medical care, yet our brief visit disclosed many with serious illness.

Nutrition now seems reasonably good, even in the half-million refugees from guerilla territory supported entirely by the government, but more calories and better protein are desirable. The traces of recent starvation (2,000 of the 7,000 in Lavrion died) are apparent in the size of the children—girls of 12 are judged as 6 or 7 years of age—and in the manyfold increase in tuberculosis. There are now some 300,000 cases of tuberculosis in Greece and only 5,000 beds in sanatoriums. Streptomycin is being used vigorously but often wastefully, and BCG vaccination is being introduced on a large scale by a Danish Red Cross mission. Diphtheria is another important public health problem, immunization not having been pushed as it might be with locally prepared toxoid. Echinococcosis is also prevalent and, although operative treatment is excellent, no preventive measures are being taken with regard to canine carriers or otherwise.

In contrast, a splendid DDT spray program, initiated by the United Nations Relief and Rehabilitation Administration has cut malaria to 5 per cent of its recent prevalence. Typhus is also well under control, and the general incidence of disease seems much as at home. The public health work of the American Mission for Aid to Greece, as indeed all phases of the work of this group, is well carried out and much appreciated by the government and people of Greece. These people have suffered greatly, but they are able and eager to rebuild. They do need help to enable them to help themselves. In the medical field this has been the central purpose of the medical mission. By working through the universities, the scientific and clinical teachers, the medical mission is reaching the future doctors and medical scientists of Greece. With lectures on newer observations, clinical conferences, ward rounds and operations, demonstration teaching, new books and apparatus on a small scale and friendly contacts that will lead to increasing interchange of personnel and experience, there is some basis for the belief that the Unitarian Service Committee's medical group will succeed in its mission.

R. W. GERARD, M D., Ph.D.,
University of Chicago,
Athens, Greece.

Medical Motion Pictures

FILM REVIEW

Scabies 1946. 16 mm., black and white, sound, 1,300 feet (1 reel), showing time thirty-eight minutes. Prepared for the Ministry of Health by the Ministry of Information, London, and procurable on loan from the American Medical Association, Committee on Medical Motion Pictures, 535 North Dearborn Street, Chicago 10.

This excellent teaching film of the British Information Services covers the problem of scabies, the natural history (life cycle) of the Sarcoptes and the clinical and microscopic diagnosis of the condition. The method of extracting the mite from the skin is excellent. Treatment is critically discussed and antiscabies drugs are reviewed; since the film was made several other equally effective preparations have come into general use. Particularly instructive is the presentation of the therapeutic management of the cases with the necessary emphasis on the family and group examination of the infected persons. The hygienic measures for the eradication and prevention of scabies are also fully considered.

This film can be highly recommended for county medical society meetings, industrial medicine and medical students. The black and white photographs and photomicrographs are beyond reproach. The speech of the British narrator is clear and distinct.

The Medical Motion Picture—Its Development and Present Application. 16 mm., color, sound, 1,100 feet (one reel), showing time thirty minutes. Produced for the American Medical Association in 1947 by Audio Productions, Inc., New York; technical adviser, Ralph P. Creer. Procurable on loan from the Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10.

The film demonstrates applications for medical films: it neither asserts nor denies that a film can shake a thermometer, but it does prove that a film could show how a thermometer is shaken. It shows that by various camera and film production technics a film can improve on first-hand observation, facilitating the transfer of knowledge or skill from one person to another. It is to be regretted that the film did not carry demonstration a step further and show how and when films are best used in medical teaching—for here it is that most of the misconceptions of the role of the medical motion picture exist.

The historical development of motion picture materials and technics is seen in a series of "period" sequences. Improvements in photographic reproduction are demonstrated by comparison of three cinematic records made at intervals between 1916 and 1930. All concern the same action (caesarean section), and the comparative merits of orthochromatic, panchromatic and color film are easily observed. Similarly, other advantages discovered with time are exhibited through excerpts from films employing these technics--sound film, diagrammatic animation, photomicrography, high speed camera work for slow motion, and combination of the motion picture camera with roentgen ray photography. The advantages of the film as a means of preserving unusual clinical material for student observation are demonstrated; an early silent, black and white record of a case of Oppenheim's disease (congenital myotonia); later color films of two congenital anomalies (ectopic heart and complete prolapse of the cloaca and urogenital sinus); and a clinical record, in sound, of speech difficulties in a case of myasthenia gravis, before and after treatment. Beautifully photographed sequences demonstrate three types of endoscopic cinematography in color--through the proctoscope, the laryngoscope and the gastroscope. The possibilities inherent here in extending clinical observation from small to large groups are exciting.

The last ten minutes of the film serve to illustrate both careful production planning and the decidedly worth while results thus obtainable. This is addressed to every man who has considered recording medical experience for the scrutiny of others. In a well planned and executed production the varied technics in motion picture photography are employed in a history of the diagnosis and management of a case of carcinoma of the thyroid with metastasis to the hip, treated with radioactive iodine. The mechanical sounds of the Geiger counter are recorded and reproduced, animated diagrams clarify certain involved points, and color reproduces faithfully physical characteristics. The technic of diagnostic aspiration biopsy is demonstrated. This, together with the indications for the use of a radioactive isotope, provides yet another evidence of the value of medical films in bringing to the attention of the profession new technics and procedures, and thus expediting their adoption. The film warns the prospective producer of the problems of film-making. It is unfortunate that the warning to avoid the use of the master print for screening was not included. Too often valuable medical information has been lost because the original print wore out or was lost or destroyed. This motion picture should do much to clarify the role of the film in medicine and to extend its use. The selection of studies in the film are disposed to point to the advantage of films as additional teaching instruments and it is, of course, in the medical schools that the peculiar advantages of the film may be best utilized.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

BOARDS OF MEDICAL EXAMINERS
BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners in the basic sciences were published in THE JOURNAL, June 19, page 749.

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: Parts I & II. Various centers, Sept. 13-15. Final date for filing application is Aug. 13. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology: Written. Various Centers, July 16. Oral. Philadelphia, Oct. 10, Sec., Dr. Paul M. Wood, 745 Fifth Ave., New York 22.

American Board of Dermatology & Syphilology: Oral. Groups A & B. Ann Arbor, Oct. 21-23. Final date for filing application is Aug. 2, 1948. Written. Ann Arbor, Sept. 9, Sec., Dr. G. M. Lewis, 66 E. 66th St., New York 21.

American Board of Internal Medicine. Written. Oct. 18. Asst. Sec., Dr. W. A. Werrell, 1 W. Main St., Madison 3.

American Board of Neurological Surgery: Oral. Chicago, June 1949. Final date for filing application in Jan. 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

American Board of Obstetrics and Gynecology: Part I. Various Centers, Feb. 4, 1949. Final date for filing application is Nov. 1. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 1.

American Board of Orthopedic Surgery: Part II. Chicago, January 1949. Final date for filing application is August 15. Sec., Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14.

American Board of Otolaryngology: Examination. Chicago, Oct. 4-9. Sec., Treas., Dr. D. M. Lierle, University Hospital, Iowa City, Ia.

American Board of Pathology: Chicago, Oct. 8-9. Final date for filing application is Oct. 1. Sec., Dr. Robert A. Moore, 507 Euclid Ave., St. Louis.

American Board of Pediatrics: Oral. Seattle, Sept. 10-12. Atlantic City, Nov. 17-19. Written, July 30. Sec., Dr. Lee F. Hill, 718 Royal Union Bldg., Des Moines, Iowa.

American Board of Plastic Surgery: Examinations are given in June and November of each year in the hometown of applicants. Sec.-Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis.

American Board of Psychiatry and Neurology: Oral. All Groups, San Francisco, October. Final date for filing application is July 15. Sec., Dr. F. J. Braceland, 102-110 Second Ave., S. W., Rochester, Minn.

American Board of Radiology: Nov. Final date for filing application is Sept. 1. Sec., Dr. B. R. Kirklin, 102-110 Second Ave., S.W., Rochester, Minn.

American Board of Urology: Chicago, Feb. 12-16, 1949. Final date of filing application is Sept. 1. Sec., Dr. Harry Culver, Route #13, Sunnyside Rd., Minneapolis 4.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Food and Drug Acts: Spectro-Chrome Misbranded as to Therapeutic Value.—The defendant was convicted of introducing into interstate commerce misbranded devices intended for use in the treatment and prevention of disease. From such conviction he appealed to the circuit court of appeals, third circuit.

The devices in question consisted of a cabinet equipped with a 1,000 watt electric light bulb, an electric fan and water container for cooling purposes, two glass condenser lenses to focus the rays from the electric light bulb and five ordinary glass slides, each of a different color. The devices were accompanied by various pieces of printed matter, which contained statements relative to the therapeutic value of the devices in the cure, mitigation, treatment or prevention of disease and directions for their use. The directions called for "irradiating" the body of the patient with "attuned color waves" projected by the device through the colored glass slides. The particular slide or combination of slides required to produce the exact color said to be needed to treat a given disorder was specified in the "Spectro-Chrome Home Guide." The patient was advised to adhere to a designated diet. He was directed to subject himself to "irradiation" while facing south or lying in a north and south position with his head to the north. The "tonations" from the Spectro-Chrome were to be taken at times specified by the defendant in the "Favorscope," which it was alleged, was compiled on the basis of solar, lunar and terrestrial radiant, gravitational influence.

The government presented a large amount of evidence, which, if believed, was amply sufficient to support a finding by the jury that the labeling of the defendant's Spectro-Chrome device was false and misleading within the meaning of the Federal Food, Drug and Cosmetic Act, in that the device did not have the therapeutic value which the labeling claimed for it. The jury, said the court of appeals, evidently believed the government's evidence.

We have examined with care each of the points raised by the defendant, concluded the court of appeals, and we find each to be wholly lacking in merit. Our consideration of the case has left us completely satisfied that the defendant had a fair trial. Indeed, the court concluded, the trial judge, if anything, leaned over backward to afford him the fullest opportunity to establish his defense and submitted the case to the jury in a charge to which no objection was or fairly could be made. The judgment of the district court was accordingly affirmed. —*United States v. Ghadiali, 165 F. (2d) 957 (1948).*

Malpractice: Liability of United States for Negligence of Army Surgeon.—This was an action for damages under the federal Tort Claims Act. It came up for a hearing on a motion by the defendant to dismiss the complaint and was argued in the district court of the United States, district D, Maryland.

The question, said the district judge, was whether the act authorizes a suit by a former member of the military forces to recover damages allegedly caused by a negligent abdominal operation performed on the soldier on or about July 3, 1945, by an Army surgeon in the state of Virginia (the plaintiff being a citizen of Maryland), while both were on active duty. Among other things, the act itself provides that " 'Employee of the Government' includes.... members of the military or naval forces of the United States" and that "'acting within the scope of his office or employment, in the case of a member of the military or naval forces of the United States, means acting in line of duty."

The federal Tort Claims Act, said the district judge after thoroughly discussing the cases cited by both plaintiff and defendant, represents a decided departure by the United States with respect to the waiving of sovereign immunity. It is a comprehensive act which, subject to the exceptions therein contained, acknowledges liability of the sovereign for injuries and damages to property and persons generally where the damage results from negligence in the performance of duties by its employees. This comprehensive act was passed subsequent to the various special acts waiving immunity under certain conditions and to a limited extent. Outside of the specific exceptions it applies to " any claim against the United States, for money only, accruing on and after January 1, 1945." It is also made expressly clear that it applies (subject to exceptions concerning combatant activities) to damages occasioned by the negligent action of members of the military or naval forces of the United States acting in the line of duty.

Continuing, the court said that the only open question here seems to be whether the comprehensive authority "to adjudicate any claim" should be narrowed by construction to exclude a claim by military personnel arising from the negligent action of other military personnel while both were on active governmental service, by reason of the special relationship existing between the government and its military forces, and particularly in view of the administrative disability benefits provided for disabled veterans under long established congressional legislation. The district court concluded that it was not presently convinced that the broad and comprehensive language of the Tort Claims Act should be narrowed by construction to exclude a case not included in the numerous exceptions expressed in the act itself. The contention to the contrary, said the court, would seemingly bar any redress to a soldier for the negligent acts of other soldiers under any circumstance (combatant activities being specially excepted by the act). Thus, for instance, a soldier on furlough injured by the negligent action of another soldier on active duty as a result of an automobile collision, would not be entitled to sue under the Tort Claims Act. Accordingly, the defendant's motion to dismiss the complaint was denied.—*Jefferson v. United States, 74 F. Supp. 209 (1947).*

Malpractice: Verdict as to Cause of Cancer Cannot Be Based on Guess or Speculation.—This was an action to recover damages for the alleged negligent conduct of the defendant dentist. From a judgment for the plaintiff in the trial court, the defendant appealed to the United States Court of Appeals, District of Columbia.

The plaintiff, a man aged about 70, had been in delicate health for a number of years. In 1943 he procured a denture from a New York dentist; some sharp points or prongs on it caused a puncture wound in his tongue. When he first noticed the wound it was about the size of a pinhead. This wound caused him considerable pain and in September 1944 he consulted the defendant, a licensed dentist in Washington, D. C. By that time the wound was about the size of the phosphorous end of a match and exposed raw flesh. It showed no tendency to heal. The defendant expressed the opinion that the wound was caused by a faulty denture, warned the plaintiff to discontinue using it and agreed to make a new one. He also gave the plaintiff a prescription for an antiseptic mouthwash, "metaphen" (nitromersol), and advised the plaintiff to use it on his tongue three times a day. According to the plaintiff, the defendant further told him that he could do as much for him as any physician. The wound continued to grow and spread, however, and by June 1945 covered a large part of the plaintiff's tongue. During that month the plaintiff consulted a general practitioner for a physical examination. The physician noticed the lesion and observed that the glands in the plaintiff's neck were swollen; he advised the plaintiff to go to a pathologist, who diagnosed the condition as cancerous. The plaintiff subsequently went to a cancer specialist who performed an operation on the glands of the plaintiff's neck. It was the plaintiff's contention that the treatment by the defendant dentist was the cause of the cancer.

At the trial three physicians were called by the plaintiff. The first, the general practitioner, testified that he knew about as much, and no more, on the subject of cancer as the average general practitioner in the District of Columbia. He admitted not only that he did not know whether the sore on the plaintiff's tongue was cancerous but that he did not know what caused the sore or the cancer. The pathologist testified that he did not know what caused the cancer or when the plaintiff's tongue had first become cancerous. In his opinion the application of "metaphen," either diluted or in full strength, would ordinarily have no deleterious effect. The plaintiff's medical witness, the cancer specialist, was asked whether, from his own examination or from any manifestations of cancer that he observed, he could testify as to when or how the cancer originated. He replied in the negative. He was unwilling to say whether the cancer had existed ten years or a much shorter period and testified that from his examination it was not possible to tell what the condition of the tongue had been one year prior to the time he saw it. He was likewise asked whether the wound in the tongue, if it was originally caused by a puncture from a sharp protruding object, would have caused a cancerous condition. He answered that he did not know, that the point was debatable.

A careful search of the record, said the Court of Appeals, discloses no word of testimony from any witness on which a jury could base a conclusion that the dental work done by the defendant, some months after the wound on the tongue developed, was the responsible cause of plaintiff's cancer; and there is likewise not a word of evidence to show any causal connection between the defendant's work in fitting and making the dentures and the cancerous condition. We hold, continued the court, that the record is wholly and entirely devoid of any evidence on which a jury could reach a conclusion that anything done by the defendant actually caused the plaintiff's cancer; hence, in telling the jury they might find that the defendant caused the cancer, the trial court erred. The subject matter of the controversy is the highly specialized subject of cancer, as to which laymen have no knowledge and as to which both court and jury must depend on expert evidence. Here, as we have seen, there is not a jot or tittle of evidence as to what caused the cancer. There is accordingly a total lack of evidence on which to base a conclusion that anything the defendant did or failed to do produced that result. Clearly the case is one in which the plaintiff must rely on his medical evidence. And this, given its full force and effect, goes no further than to show a possibility that irritation produced by the dentures made by the defendant might have produced or spread the cancer. This is not enough, concluded the Court of Appeals, and leaves the question wholly to guess and speculation. Accordingly, the judgment of the trial court was reversed and the case remanded for a new trial.—*Kasmer v. Sternal, 165 F. (2d) 624 (1948).*

Charitable Hospitals: Liability for Nurse's Negligence.—The plaintiff sued for damages for burns suffered while she was a patient in the defendant hospital. From a judgment for the plaintiff, the hospital appealed to the supreme court, appellate division first department, New York.

Following the plaintiff's return to her room after an operation under spinal anesthesia and while she was being given an intravenous injection, the plaintiff complained of feeling cold. At the doctor's direction a hospital nurse procured hot water bottles, which the doctor and nurse placed in the plaintiff's bed adjacent to her feet. According to the plaintiff's testimony, she complained of warmth within five minutes and thereafter at five or ten minute intervals repeatedly complained of a burning sensation. To these complaints the nurse paid no attention, until the plaintiff screamed in agony. Nurses and doctors then removed the bottles. According to the nurse's testimony, the bottles were removed on the first complaint. The plaintiff suffered a number of third degree burns.

The legal premise, from which consideration of this case must start, said the court on appeal, is that the hospital, being a charitable organization, is not liable for the negligence of a doctor or nurse acting in a medical capacity. A hospital is liable, however, for the administrative acts of its servants and would be liable for the act of a nurse acting in an administrative capacity for the hospital rather than in a medical capacity for the patient. The legal basis for the distinction, the appellate division continued, is that medical service, although procured by the hospital, is professional service rendered to the patient by a doctor or nurse; administrative work, on the other hand, is part of the hospital service and is performed by servants of the hospital. The question, therefore, is whether the nurse's failure to remove the hot water bottles on plaintiff's complaints was an administrative failure or medical default.

In the trial court, liability was predicated on the theory that the use of the bottles was medical treatment, but the failure to remove them on complaint was administrative rather than medical neglect. The appellate division said that the use of the hot water bottles was a medical or professional service. As the use was medical, the default of the nurse, whether of misfeasance or nonfeasance, was likewise medical. It cannot be said that failure to discontinue medical treatment in time is an administrative failure rather than a medical failure or that the complaints of plaintiff converted medical neglect into administrative neglect. The complaints might be considered sufficient notice to a prudent nurse that the treatment should have been discontinued, but her failure to respond to such notice was a failure of professional judgment. Liability could be imposed on the hospital, therefore, only by holding that the nurse had an administrative duty, over and above her professional duty, to heed the plaintiff's complaints and to remove the hot water bottles. Such a holding would not conform with reality, said the appellate division. The nurse was acting as a nurse, not as a servant doing administrative work, and her failure, whether of action or inaction, was nurse failure. Under the law the defendant hospital is not liable. Accordingly, the judgment in favor of the plaintiff was reversed and the case dismissed.—*Sutherland v. New York Polyclinic Medical School and Hospital, 75 N.Y.S. (2d) 135 (N. Y. 1947).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Titer of Antistreptolysin O in Human Serum and Cerebrospinal Fluid. W. W. Igersheimer. -p. 65.
Hyperlipemia Following Intravenous Infusion of Hypertonic Solution of Sucrose. W. Heymann and Mary E. Hartman. -p. 68.

Blood Levels with Oral Penicillin.--Stressing the advantages of oral administration of penicillin, Cohlan, Lewis and Seligmann show that a divergence of opinion exists as to the necessity of buffering penicillin for oral administration. Further data were needed under controlled conditions on the effect of the oral administration of buffered and unbuffered penicillin on the blood levels of infants and children. If acidity of the gastric juice plays a prominent role in the destruction of penicillin, it would seem that buffering penicillin would have less effect in securing higher blood levels in infants, since the *p*H of gastric juice is considerably higher in infants than in children. Studies were made on 16 children ranging in age from 2 to 12 years and on 14 infants, 10 days to 4 months of age. Comparable amounts of buffered and unbuffered penicillin were given. Dosage of penicillin ranged from 3,000 to 5,000 units per kilogram of body weight. Levels of penicillin in the blood were considerably higher in children who received the buffered preparation, whereas no appreciable difference in the concentration of penicillin in the blood was noted in infants with the buffered and with the unbuffered preparation. The authors regard it as necessary to use a buffer when penicillin is administered orally to children. On the other hand, the higher *p*H of the gastric juice of infants causes no appreciable destruction of penicillin in the stomach, and for this reason no buffer is necessary when the drug is administered orally to infants.

Epidemic Poliomyelitis in Children.—Grulee and Panos describe the symptoms and clinical management in 464 cases of acute poliomyelitis. Twenty-three per cent of all cases were of the bulbar type; all the deaths occurred in this group. Central cardiorespiratory failure was considered to be responsible for all but 1 of the deaths. Arterial hypertension was encountered in 85 per cent of cases of bulbar poliomyelitis. Encephalitic manifestations were present in 17 per cent of all cases studied. Prevention and treatment of hypoxia by interrupted aspiration of accumulated secretions, tracheotomy and administration of oxygen, the respirator or other means are emphasized.

Ocular Lesions from Atomic Bombing.--Flick describes ocular lesions that are directly related to deficiency in blood elements and in no way directly related to the action of radiant energy on the eye. On repeated examinations of the same lesions it seemed likely that the exudative lesions represented milder involvement. Persons manifesting both hemorrhage and exudation were on the average closer to the site of the explosion and had lower white blood cell counts than did those with either hemorrhage or exudation alone. The witnessing of a transition from the fluffy exudate to the "Roth" type hemorrhage and preretinal hemorrhage was rather impressive. It would seem logical to conclude that local areas of the retina could become swollen by transudation of serum through the walls of hyperpermeable capillaries in the presence of anemia, oligocythemia and consequent lowered oxygen tension in the blood. If this process was to become so intense as to cause tissue breakdown in the lesion itself as a result of stasis and anoxemia, the extravasation of whole blood elements could occur, superimposing itself on the original lesion and coming to surround it as "the hemorrhage with the white center." The locations of these lesions near large vessels is explained by the increased intravascular pressure in vessels of larger size. In those persons who recovered from the hemopoietic depression, the ocular lesions were observed to disappear without residual damage to the eyes.

Conservative Surgery in Tumors of Bone.—Coley and Higinbotham point out that in recent years there has been a growing tendency to rely more on surgical measures and less on roentgen therapy in neoplasms of bones. They have devoted considerable thought to the possibilities of procedures less radical than amputation and have come to the conclusion that the patient stands to benefit rather than to suffer from the surgeon's conservatism. The authors define conservative surgery as an elective operation which either avoids amputation entirely or which places it at a lower level with greater prospects of improved function. They discuss the more conservative measures and show that curettage, partial resection, segmental resection and excision are methods which may at times be used in lieu of amputation. If these procedures are successful in eradicating the primary tumor and in avoiding a local or regional recurrence, they may be considered as justified. High thigh amputation for osteogenic sarcoma and chondrosarcoma of the lower femur may in selected cases be a safe substitute for disarticulation of the hip and offers greater advantages to the patients who survive. Illustrative case reports are supplied.

Carotid Body Tumors.—MacComb discusses various aspects of tumors of the carotid body on the basis of 10 cases observed at the head and neck service of the Memorial Hospital in New York. Whereas some observers believe that the majority of these tumors are noncancerous, it has been shown in other series and in the present series that about half are cancerous. Microscopically, the benign tumors are found to be extremely vascular. Small cells predominate in a uniform pattern. In the more malignant group pleomorphism occurs. Most authors agree that tumors of the carotid body should be removed surgically. Yet the necessity of ligation of the common and internal carotid arteries occurs so frequently that, because of the high postoperative mortality, it might be better to refrain from this procedure when it is possible to be certain of the noncancerous nature of the tumor. In the present series of 10 patients the tumor of the carotid body was resected without injury to the arteries in only 3 instances. In the other 7 patients it was necessary to include the carotid arteries in the resection of the tumor. There were 4 postoperative deaths. Hemiplegia preceded death in each instance. Fatalities following ligations of the carotid arteries are usually the result of insufficient collateral cerebral circulation or an ascending thrombosis in the internal carotid artery. External compression of the common carotid artery, as described by Matas, is undoubtedly of value in testing for the efficiency of the collateral cerebral circulation. The use of increasing periods of daily external compression may be of some aid in improving the compensatory flow of blood through the circle of Willis. The author suggests the use of heparin postoperatively as a possible means of preventing an ascending thrombosis in the internal carotid artery.

Physiology of Respiration in Bulbar Poliomyelitis.—According to Kubicek, Holt and Kottke, many lives can be saved by the early correction of the respiratory deficiencies encountered in bulbar poliomyelitis. Because hypoxia quickly destroys neurons, the aim of oxygen therapy should be to maintain an uninterrupted normal arterial oxygen tension of at least 100 mm. of mercury. Examination of the hemoglobin saturation curve reveals that small decreases in the percentage of oxygen saturation of hemoglobin represent large changes in partial pressure of oxygen in solution in the plasma. The difference in partial pressure of oxygen between plasma and the fluid surrounding the oxygen-consuming cell is one of the factors which determines the rate at which oxygen flows from plasma to cell. Cyanosis is seldom detectable if saturation of hemoglobin is above 80 per cent. When cyanosis is first visible the flow of oxygen from capillary blood plasma to nerve cell may be decreased by at least 65 per cent; thus patients who become cyanotic usually succumb. Edema, perivascular infiltration, hemorrhage and debris may be considered as other important factors increasing the resistance to diffusion of oxygen from plasma to cell by the increased distance from capillary to cell, by the physical obstruction by particulate matter and by the increased oxygen consumption due to infiltrating white cells. If laryngeal and pharyngeal paresis are observed along with rise of temperature and increase in pulse rate, tracheotomy should be performed and oxygen therapy started immediately to prevent hypoxial damage to already infected nerve cells. Indecision in diagnosis and delay in treatment of hypoxia will fail to decrease the present high mortality rate of bulbar poliomyelitis.

Medulla Oblongata in Anoxia.—Gellhorn's physiologic studies of the effect of anoxia on the respiratory and circulatory system have shown that in acute conditions anoxemic stimulation of the chemoreceptors of the sinoaortic region results in an increased respiratory volume and increased blood pressure. Elimination of the chemoreceptors causes respiratory and vasomotor failure under conditions of acute anoxia. Data in the physiologic literature suggest that in chronic anoxia respiration and possibly blood pressure are regulated through the medullary centers alone. These data make it understandable that even mild degrees of chronic anoxia may have fatal effects if they act on diseased medullary neurons. This seems to be the physiologic rationale for oxygen therapy in bulbar poliomyelitis.

*Tubercle Bacilli in Cerebrospinal Fluid of Dementia Precox. R. A. Darke. -p. 686.

Tubercle Bacilli in Dementia Precox.—Darke says that the question of a positive relationship between tuberculosis and dementia precox recurs periodically. In the studies presented here a total of 20 spinal fluids from psychotic patients without tuberculosis were examined by centrifuging the fluids, injecting the supernatant fluid subcutaneously into the groin of guinea pigs and staining and examining the sediment. The spinal fluids were examined also for sugar, protein and cells; Kolmer and colloidal gold curve tests were made. There was no evidence that tubercle bacilli were present in the nontuberculous patients, and the data obtained thus tend further to confirm the observations of those who believe that there is no etiologic relationship between the tubercle bacilli and schizophrenia.

The Nagasaki Survivors in 1947.—Warren says that by presidential directive, under the National Research Council, an Atomic Casualty Commission is actively cooperating with the Japanese in a long range study of the surviving population of Hiroshima and Nagasaki. Since the explosions at Hiroshima and at Nagasaki were air bursts, relatively little of the fission products remained at the site. Instead, they were widely disseminated through the stratosphere. Consequently, every bit of bombed area is safe for habitation and for cultivation. The scars of flash burns are relatively frequent among the survivors. Special attention is being given to keloid formation in these scars. The incidence of the keloids appears to be somewhat greater among Japanese than whites, but there is no evidence that there is any specific relationship between the occurrence of keloid in scar tissue and exposure to the explosion of an atomic bomb. In 1945 a considerable number of the survivors manifested disturbances of the hemopoietic tissue, as evidenced both by peripheral blood counts and by sternal marrow biopsies. In 1947 most of the survivors had returned approximately to normal. Three cases of leukemia, 1 probable case of leukemia and 1 of multiple myeloma have been reported as occurring among the group of survivors up to the present time. In examining sternal marrow aspirations in a few of the survivors, an abnormal prevalence of monocytes and reticular cells suggests in some that the marrow may not be entirely normal. No tumors of gonads have been reported among the survivors. Only slight changes in dominant genes can be expected, so it will probably be at least twenty-five years before reliable data on this vital point are obtained.

Cytologic Method in Diagnosis of Cancer.—Fremont-Smith and associates point out that for many years pleural and ascitic fluids have been examined for malignant cells, their presence depending on the same property of desquamation. The method was first made applicable to other than metastatic tumors by Papanicolaou, who in 1928 recognized cancer cells in the vaginal secretion of women with cancer of the uterus. The value of the method for the diagnosis of uterine carcinoma has been established. In the detection of early cervical neoplasms it is apparently more accurate than routine biopsy. Studies are in progress to determine the efficacy of cytologic examination in the diagnosis of cancer of the stomach, lung and urinary tract. In the early diagnosis of gastric carcinoma the new method may prove to be of great value.

Septicemia Due to Proteus Vulgaris.—Reviewing the data on 52 cases of septicemia due to Proteus vulgaris that have been reported in the literature, Abrams says that these cases fell into two main groups: those associated with disease of the genitourinary tract, and those associated with infection of the ear, nose and throat. Until the advent of streptomycin the prognosis in these cases was poor. The author reports a patient who was cured by streptomycin and suggests that a striking reduction in mortality may be expected.

Pulmonary Disease in Workers Exposed to Beryllium Compounds.—Pascucci presents a brief summary of the clinical data accompanying the chest films of 32 patients who were exposed to dust of beryllium compounds and in whom delayed pulmonary changes developed. Pathologic changes observed at necropsy in several cases are briefly described. Histories of 4 patients are presented. Roentgenograms of the lungs are characterized by a bilateral, uniformly widespread, diffusely granular and/or nodular infiltration. No other disease entity is known to produce this fine disseminated granular type of infiltration. In both types, but more so in the granular, there may develop coalescent or confluent shadows. The period of observation is not yet adequate to warrant a valid correlation between the clinical course and the pulmonary changes, nor is the final result known in those patients with clinical remission but persistent pulmonary lesions. Prognosis should be guarded in patients with the granular type of nodulation, especially when confluent shadows are superimposed. Roentgenographic pulmonary changes may exist without significant symptomatology. Many of the patients were at first suspected of having Boeck's sarcoid. A diagnosis of silicosis was almost as frequently entertained.

Differentiation Between Pericardial Effusion and Cardiac Dilatation.—Arendt shows that differentiation between cardiac dilatation and pericardial effusion is not easy, especially as the two conditions may occur simultaneously and sometimes from the same cause. Valsalva and Mueller tests are used in the roentgen differentiation. The dilated heart shows greater changes in size and shape than the heart enclosed in pericardial effusion or even the normal heart. At the change over from the Valsalva to the Mueller test the weak pulsations of the dilated heart increase and become visible. In the presence of pericardial effusion such pulsatory changes do not occur in equal measure. Observation of the angle of the bronchial bifurcation is also suggested as a diagnostic aid. Its visibility is frequently obscured in pericardial effusion. Visibility and widening to 100 to 130 degrees favor a diagnosis of auricular enlargement or hilus tumor. Absence of lateral and posterior displacement of the esophagus or a rather shallow, wide-curved pressure zone along the whole length of the lower esophagus is in favor of pericardial effusion. Lateral and posterior displacement and localized auricular impression are in favor of cardiac enlargement. Diminution or absence of cardiac pulsation is an important diagnostic sign of pericardial effusion, demonstrable by kymographic examination. Rapid change of the heart size at repeat examination is in favor of pericardial effusion but is not a reliable sign. There is no configuration of the heart entirely pathognomonic of the pericardial accumulation of fluid.

Penicillin in Subacute Bacterial Endocarditis.—Christie reviews observations on 269 patients with subacute bacterial endocarditis who were treated with penicillin at 14 different centers appointed by the Medical Research Council in Great Britain. When the investigation was first begun, penicillin was still scarce and the dosage was inadequate. Subsequently treatment was continued for longer periods and larger daily doses were given. Administration of 500,000 units of penicillin a day for twenty-eight days can be expected to control the infection in about 90 per cent of patients with subacute bacterial endocarditis, but about 35 per cent of these die of heart failure and other complications. Larger doses should be given for a longer period of time to patients who relapse and to patients in whom the infecting organism is more than eight times as resistant as the Oxford staphylococcus. Of the relapses, 90 per cent occurred within a month of treatment, but danger of relapse persists after a year or more of good health. Evidence of heart failure or of poor nutrition is of great importance in prognosis. The duration of infection and the nature of the primary cardiac lesion are also of some significance. What appear to be viable organisms are occasionally found in the cardiac valves of those who have died after the infection has apparently been controled.

Rare Forms of Herpes Zoster.—Parkinson reports 3 cases of herpes zoster with unusual motor and cutaneous manifestations. In the first patient the zoster was accompanied by paralysis in the distribution of the fifth cervical segment. The second patient had ophthalmic zoster with generalized eruption, followed by weakness of the levator palpebrae. In the third patient the zoster was of trigeminal and cervical distribution accompanied by generalized eruption and followed by facial palsy. It is suggested that zoster virus produces a pleomorphic group of diseases with varying degrees of cutaneous and nervous symptoms. In the classic form the brunt of the infection is borne by the sensory ganglions, the resulting symptoms being pain and a cutaneous eruption in the peripheral distribution of the fibers proceeding from the affected ganglions. Study of the rarer manifestations of the disease shows that in some cases in which motor symptoms occur there is clinical and pathologic evidence that the anterior horn cells of the spinal cord are affected in a manner similar to that in poliomyelitis. In others the infection produces an exanthem clinically identical with that of varicella. From the available evidence it seems no more reasonable to deduce that varicella and zoster are caused by the same virus than it would be to make a similar deduction regarding zoster and poliomyelitis. It seems much more probable that the virus is capable of producing a range of clinical manifestations varying from simple motor lesions to generalized cutaneous lesions, and that the classic form of the disease lies midway between these extremes.

"Tridione" for Petit Mal.—Butter points out that the synthetic anticonvulsant drug "tridione," 3,5,5-trimethyloxazolidine-2,4-dione, has been extensively used in the treatment of petit mal in America since 1944. When supplies of this drug became available in Britain, a preliminary investigation was made at a hospital for epilepsy. The treatment with "tridione" in 23 cases of petit mal is analyzed. Approximately four fifths of the patients improved, but various toxic symptoms and signs were manifested in almost every case. Nineteen patients mentioned that they found the outdoor light too bright. This phenomenon was variously described as "dazzle" or "glare," or "a whiteness like mist over everything." In most instances the sensation ceased after a short interval. Five men were aware of slight drowsiness, apparently due to the drug; 1 complained of lack of concentration and 1 of restlessness; in 2 slight ataxia developed; 2 complained of hiccup and 2 of slight epigastric discomfort. In 1 there developed a slight rash, and 1 had a severe rash of the face, neck and hands. Most of the patients were anxious to continue taking the drug, as in their opinion the relief obtained from the reduction in their attacks more than outweighed the slight nuisance of the "dazzle phenomenon" or the other symptoms. The author believes that "tridione" has a pronounced inhibitory effect on petit mal.

Biology of Cervix and Puerperal Infections.—McIlrath and Hellestrand review the history and the present knowledge of puerperal infection. Their own investigation was undertaken in an endeavor to discover if cervical lesions present during pregnancy were caused by or harbored organisms which could spread into the tissues during labor and the puerperium and be responsible for the low grade infections so frequently seen in women who have borne children. Seventy-seven women were studied throughout pregnancy, in the puerperium and post partum. Of these, 12 were normal, 7 were referred as normal but classified as "for observation," 37 were primigravidas and 21 multiparas with leukorrhea. The pH data, cells seen in smears from cervix, vagina and urethra and cultures taken from these areas were studied. Biopsies were taken at intervals throughout pregnancy, the puerperium and post partum. From a study of these, normal changes in the cervix were recognized and four deviations from normal were classified. They are hyperplastic, proliferative, secretory and mixed types. In only 2 patients in the normal group did inflammatory lesions develop, and both these patients had suffered traumatic lesions. In the hyperplastic group 2 patients who entered labor with active erosions later had inflammatory lesions, although they suffered no trauma. In nearly half of the abnormal primigravidas (15) inflammatory lesions developed, though traumatic lesions had been suffered by only 2 of these patients. In about two thirds (14) of the abnormal multiparous group inflammatory lesions developed, and 8 of these patients had suffered trauma. Of the 23 patients who had no pelvic abnormality at their final visit, all had clinically healthy cervices or minor deviations from normal at the last prenatal visit. The authors conclude that the cervical lesions constitute a definite danger to the mother and increase chances of the development of a low grade pelvic infection after confinement. Every patient should have her cervix inspected at each antenatal visit just as faithfully as her blood pressure is taken. The treatment which proved most satisfactory was the application of penicillin-sulfanilamide powder and vitamin B therapy. Every patient should be followed up for at least eight weeks post partum, as spreading lesions may not appear before that period. If a woman with a cervical erosion is seen before marriage, everything possible should be done to cure the condition in view of the risk that a low grade pelvic inflammation may develop after a pregnancy.

Basal Temperature in Sterile Women.—Halbrecht says that investigators are of the opinion that the two most important causes of female sterility are tubal occlusion and failure of ovulation in women who menstruate normally. Although the diagnosis of tubal occlusion is now easy, the investigation of ovarian activity still offers difficulties. Among methods used for this purpose, endometrial biopsy has been considered the most reliable, but variations of the basal temperature curve also seem significant. The author reviews studies on 425 sterile women, who measured their temperatures in 1,184 cycles. In 80 per cent the the oral basal temperatures varied between 36.4 and 36.8 C. (97.5 and 98.2 F.) in the postmenstrual phase and between 36.9 and 37.2 C. (98.4 and 99 F.) in the premenstrual phase of the cycle. In 90 cases it was possible to compare the basal temperatures with endometrial biopsies taken during the same cycle. In all but 3 cases the results were identical. It seems that the basal temperature is more reliable than the edometrial biopsy, at least for the purpose of determining the time of ovulation. The temperature curves in normally menstruating sterile women were biphasic. The two hundred and twenty two cycles in which the temperature curve was monophasic must be considered as anovulatory. In many women ovulation seems to effect no more than a drop of 0.1 to 0.3 degree Centigrade (0.18 to 0.54 Fahrenheit) during one to three days of the intermenstrual midcycle. Thyroid extract, progestin and estrogens do not change the temperature level. The rise in temperature in the second half of the cycle is caused by a complex mechanism, lutein being probably only one of the many factors. Amenorrheic women have monophasic curves. In many cases, however, the temperature rises fourteen days before spontaneous menstruation, indicating that ovulation has occurred.

Club Foot.—Reviewing the various treatments for club foot, Smith is of the opinion that the Denis Browne splint, either in its original form or in its modifications, remains the most satisfactory appliance in the treatment of club foot. The author's preference is for the modification of Bell and Grice, which for him has solved the problem of keeping the heel in contact with the sole plate. There is no need to use great force in manipulating the infant's foot, the majority of club feet in the newborn being amenable to overcorrection by gentle stretching in four to six weeks at the outside. It is at this stage that the Denis Browne splint can be introduced with such telling effect and the overcorrection continuously maintained until walking commences. Inversion of an undeveloped heel is the main element in relapsed or neglected club feet. When the child is 5 or 6 years of age this deformity cannot be corrected by manipulation. In these tarsectomy is usually planned about five years later, the accepted age for stabilizing operations. The author has operated on 30 patients of this age. He has removed a wedge from the neck of the talus and taken a cut from the calcaneocuboid joint. In 25 of these cases the purpose of the operation was achieved, that is, a plantigrade foot. This is only a makeshift operation, as it does not effect the most important element in the deformity or help the equinus position. However, it does produce a foot much improved in appearance, with a more normal weight distribution. For the treatment of older patients the author prefers an osseous reconstruction in the form of a wedge tarsectomy.

- *Atypical, Verrucous Endocarditis of Libman-Sacks Type and Its Relationship to Acute Lupus Erythematosus. A. von Albertini and O. Alb. -p. 133.
- *Libman-Sacks Disease. E. Coelho and A. Gonçalves. -p. 170.
- *Allergic Myocarditis Following Use of Antirabic Vaccine. E. Lyon. -p. 183.

Atypical Verrucous Endocarditis.—Von Albertini and Alb report 1 case of atypical verrucous endocarditis of the Libman-Sacks type with acute disseminated lupus erythematosus in a woman aged 24. Two sisters of the patient had a chronic form of the disease. The patient presented the clinical picture of a generalized infectious condition with acute exacerbations initiated by chorea minor and associated with high fever, disturbance of circulation, polyarthritic and nephritic manifestations and panmyelopathy. The dissemination extended to the mucous membranes of the oral cavity, the urinary bladder and the vulva. Death occurred from bronchopneumonia, and the anatomicopathologic picture revealed a characteristic form of atypical verrucous endocarditis complicated by bland embolism of an intermediate form between rheumatic endocarditis and endocarditis lenta. In addition there were inflammatory changes in the arteries in the sense of periarteritis nodosa which suggested an acquired allergic reaction. From the pathogenic point of view the clinical and bacteriologic peculiarities of the Libman-Sack syndrome may be explained best on the basis of a focal infection (suppurative bronchiectasis in the author's case). The acute form of lupus erythematosus is probably a modification of a preexistent chronic lupus erythematosus, and the diffusion of the cutaneous disease may occur under the influence of the Libman-Sacks disease. Spread of this type also occurs as a sequela of other severe diseases such as tuberculosis or cancer.

Libman-Sacks Disease.—Coelho and Goncalves report 2 cases of Libman-Sacks disease in 2 women aged 22 and 18, respectively, who died. The first patient had an acute disseminated lupus erythematosus and presented a mitral systolic murmur on auscultation; necropsy was not performed. The second patient also had an acute disseminated lupus erythematosus without any symptom of endocarditis on auscultation. Necropsy in this case confirmed the observations of atypical verrucous endocarditis by Libman, Sacks, Gross and other American authors. There were no vascular changes of the renal glomeruli. Because of the presence of mural endocardiac lesions, clinical symptoms of the verrucous endocarditis may be absent. On the basis of the morphologic changes and the clinical symptomatology it is considered that acute lupus erythematosus and Libman-Sacks disease constitute the same disease, which may or may not involve the skin but which always affects the viscera (with or without mural or valvular endocarditis).

Allergic Myocarditis.—Lyon reports 1 case of allergic myocarditis in a man aged 58 who had been bitten by a dog and had been given fourteen antirabic vaccine injections. The vaccine used was a 2 per cent emulsion of fixed virus brain destroyed by the combined action over twenty-four hours of heat and 1 per cent phenol. After each injection, redness, swelling and itching was noted at the site, increasing in intensity with each injection. A few weeks after this treatment had been terminated he began to suffer from frequent attacks of palpitation during working hours. During subsequent months palpitations increased, particularly after mounting stairs and after some walking. The patient then had dyspnea and was susceptible to quick fatigue. Electrocardiograms showed that both the atrioventricular and intraventricular conduction time were at the upper limit of normal or had slightly surpassed this limit, to become normal again in the course of time. Both atrioventricular and ventricular extrasystoles occurred occasionally. There were T wave changes in CF2, a high T in the first and a flatly negative T in the second record, while T was again normal in the fifth record. In elderly persons with an allergic history the employment of skin tests is indicated to determine the hypersensitivity to antirabic vaccine before initiation of the treatment. The occurrence of allergic myocarditis in the author's case suggests that myocarditis often may not be the result of infection and that the way in which the organism and the heart muscle react may play a decisive part in the pathologic mechanism.

91:3665-3740 (Dec. 20) 1947

- *Auricular Fibrillation During Pregnancy and Puerperium. G. A. Lindeboom. -p. 3686.
- *Open Dislocation of Four Fingers in Metacarpal Joints. B. A. G. Veraart. -p. 3695.

Auricular Fibrillation in Pregnancy.—Lindeboom presents histories of 7 women with mitral stenosis, in whom auricular fibrillation developed during pregnancy or puerperium. Review of the literature suggests that fibrillation develops infrequently in young pregnant women with mitral stenosis. In the group of 7 all but 1 were over 30 years of age. All the patients had signs of decompensation. If the patient survived, the decompensation subsided under suitable treatment. The mortality rate is considerable; one statistical report indicates that 33 of 99 cases terminated in death. Little is known about the later fate of women who were discharged from the hospital. Efforts should be made to prevent decompensation. Hospitalization is advisable in order to enforce rest in bed; digitalization should be employed, and after the signs of decompensation have subsided efforts can be made to restore the normal rhythm by quinidine. The author does not regard cesarian section advisable for these women.

Dislocation of Fingers in Phalangometacarpal Joints.—Veraart reports the case of a coal miner in whom 4 fingers of the left hand were dislocated dorsally, with the result that the heads of the metacarpal bones were denuded and exposed through the wounds. The flexor tendon sheaths were all ruptured. After the wound was cleansed with hydrogen peroxide and diluted alcohol, it was disinfected with 5 per cent tincture of iodine. Healing took place by primary intention after reposition and suture. After six weeks the patient was able to resume light work. Flexing of the fingers was so slightly impaired that at the end of six months the patient received compensation on the basis of a 20 per cent disability.

- *Painful Syndrome of Upper Extremity: Shoulder Pain and Brachialgia. R. Leriche. -p. 9.

Shoulder Pain and Brachialgia.—According to Leriche, cold, epidemic neuraxitis, subdeltoid calcification, a glomus or a cervical rib may be the causes of brachialgia which will be identified easily. In the absence of one of these causes two others may be considered, namely, herniation of intervertebral disk or abnormality of the thoracic outlet. Frequently the symptoms of herniated disk, such as stabbing pain or pinprick pain, heaviness, dead fingers, tingling and dysesthesia may be manifested only approximatively in the area of the affected root. There may be radiating pain in the nape of the neck, in both shoulders and in the breast. The motor phenomena, hypotonia, fibrillary contractions and disturbances of reflectibility may be more closely localized. There seem to be few vasomotor disturbances associated with herniation of the disk. Attacks resembling Reynaud's syndrome may be absent, although they are common in the scalenic syndrome and in cases of cervical rib or abnormal first rib. In herniation of the disk the contact is purely radicular. In the syndromes of the subclavian cavity and of the outlet of the thorax there is contact with the subclavian, as demonstrated by the high incidence of arterial dilatation or of distant thromboses. In the latter syndromes there may be occasional cramps. In any type of brachialgia the symptoms may be bilateral. Nocturnal predominance of the pain is characteristic of the syndrome which originates in the subclavicular cavity. Compression of the vein in the costoclavicular interval may be one of the causes. Symptomatology frequently may thus be an aid to the clinical diagnosis of brachialgia, while roentgenography will establish the diagnosis: when the transverse process of the seventh cervical vertebra appears like the beak of a toucan or thinned, one should consider a stellate syndrome; on the contrary, when an obliterated intervertebral space may be seen in the upright column, and the closure of an intertransverse aperture in the oblique, one should consider herniation of the disk. Repeated infiltrations of the stellate ganglion or section of the scalenus should be carried out in the first case and laminectomy in the second. Section of the scalenus should not be done without additional exploration of the superior aperture of the thorax, and in certain cases it should be combined with excision of part or all of the first rib.

*Penicillin in Therapy of Hepatobiliary Infection: New Method for Duodenal Application. W. Martini. -p. 433.

Penicillin in Hepatobiliary Infection.—Treatment of hepatobiliary infection consists in emptying the stomach of gastric secretion; biliary drainage with isotonic sodium chloride solution, repeated several times at intervals of thirty minutes; washing the duodenum by instillation of 15 cc. of isotonic sodium chloride solution through an Einhorn sound; and, immediately after washing, intraduodenal administration of a solution of 30,000 Oxford units of penicillin in 15 cc. isotonic sodium chloride solution. The patient remains in right lateral posture for from five to ten minutes, after which the sound is removed and intramuscular injections of 20,000 Oxford units of penicillin are given at intervals of three hours to a total dose which varies between 800,000 and 1,000,000 units. Treatments are repeated at intervals of one month. The number of treatments varies between two and six, depending on the seriousness of the infection and the clinical reaction to treatment. Permanent clinical cure is reported in 35 cases.

*Q Fever (Queensland Fever) in Switzerland: Endemic Pneumonias Caused by Rickettsia Burneti. O. Gsell. -p. 1.

Recent Contributions to Physiology of Secretion of Epinephrine. H. Hermann. -p. 10.

*Roentgen Therapy of Localized Hyperhidrosis: Follow-Up of 192 Patients. G. Miescher and C. Böhm. -p. 14.

*Nicotinamide in Pregnancy Toxicoses, Particularly Hyperemesis. W. Widmer. -p. 20.

Q Fever in Switzerland.—Gsell says that of the cases of atypical pneumonia observed at the Medical Clinic of St. Gallen in Switzerland in the spring of 1947, 7 gave positive complement fixation tests with the antigen of Q fever. Further investigations revealed that at least four groups of infections due to Q fever occurred in Switzerland during 1947. The first group was a familial one, in which 4 persons became ill within three days. The second group involved a village epidemic, in which about 50 cases of pneumonia, chiefly in men, occurred in four weeks. The rickettsial character of the disease was serologically demonstrated in 1 case at once and in 6 others in the course of the next six months. The third group comprised sporadic cases that occurred in the spring of 1947 in St. Gallen and in the autumn in eastern Switzerland. The fourth group was an epidemic of 30 cases occurring in a boarding school in Geneva. Sudden high fever, lack of appetite and malaise, occasionally with vomiting and sweating, severe headache and sometimes stupor were the usual symptoms. Roentgenograms of the chest usually revealed extensive infiltrations in the form of soft multiple shadows. In the severe cases physical signs of pneumonia became evident later on. The process usually had a favorable outcome with subsidence of the fever between the fifth and twelfth days. Complications took the form of serious pleurisy, orchitis or thrombophlebitis. Serums showed positive complement fixation titers for Rickettsia burneti, and injection of blood into guinea pigs resulted in the appearance of specific antibodies of Rickettsia burneti.

Roentgen Therapy of Hyperhidrosis.—In order to obtain information about indications for roentgen treatment of localized hyperhidrosis Miescher and Böhm investigated cases involving such treatment from as far back as 1925, when the iontometric system of measurement came into use. Treatments were given after four, six and eight weeks. At the first and second irradiations 400 r were usually given and at the later ones 300 r. Only patients with the localized form of hyperhidrosis of hands, feet or axillas were treated with roentgen rays. A total of 192 patients were studied, and it was found that there is a considerable difference in the efficacy of roentgen therapy, depending on whether the hyperhidrosis is continuous or intermittent. Whereas the results of roentgen therapy were favorable in more than four fifths of those with the continuous form, less than one third of those with the intermittent form responded favorably. Although considerable dryness of the hands resulted in some cases, no roentgenologic injuries of the skin resulted.

Nicotinamide in Toxicoses of Pregnancy.--Widmer says that he obtained excellent results with nicotinamide in patients with various gestational disturbances such as those of the appetite, and in nausea, emesis and hyperemesis. At the first injection 1 ampule of 100 mg. of nicotinamide is usually administered. If this injection has no effect, the author usually suggests to the patient that she try from four to six injections over a number of days. If the first injection effects some improvement, a total of three or four injections is usually adequate. Of 68 women with various forms of gestoses, particularly hyperemesis, 38 were cured, 18 more were improved and the remaining 12 remained uninfluenced.

Book Notices

Directory of Convalescent Homes in the United States. Prepared under the Auspices of the Committee on Public Health Relations of the New York Academy of Medicine. *Sixth edition Paper.* Price, 50 cents. Pp. 112. The Burke Foundation. White Plains, New York, 1947.

The Committee on Public Health Relations of the New York Academy of Medicine presents in this booklet a list of one hundred and sixty-four institutions in thirty states devoted to convalescent care, tuberculosis preventorium service and the hospitalization and treatment of cardiac disease, particularly in children. The majority of the homes are philanthropic institutions offering free care or service below cost. Proprietory institutions are also represented, but only when charges are low enough to enable patients to obtain accommodations for ward or semiprivate care. Homes offering service primarily for the aged are not included.

The committee recognizes that without inspection facilities it is not possible to evaluate the quality of service rendered, and therefore the directory listing does not in any way constitute an endorsement or approval of individual institutions. Though the list is not a complete record of the convalescent homes in all states, it nevertheless becomes a useful source of reference for physicians, hospital administrators, social service workers, welfare agencies and individual patients and their families. In relation to each institution the directory gives information about location, buildings, bed capacity, ownership or control, administrative personnel, medical staff, nursing service, types of patients admitted, requirements for admission, therapeutic facilities available and rates. Of the institutions listed, seventy-three are for adults only, seventy-six limit their admissions to children and fifteen offer facilities for both adults and children.

Medicine Today: The March of Medicine 1946. No. XI of the New York Academy of Medicine Lectures to the Laity. Cloth. Price, $2. Pp. 177. Columbia University Press, 2960 Broadway, New York 27, 1947.

The lectures in this volume were designed for the public. There are seven lectures in this series. They offer a realistic appraisal of the relation of present day medicine to the larger society in which we all live. The moral standards of the community require that the ill be cared for regardless of ability to pay. Medicine is emerging as a social science as well as a natural science. The form of medical practice must not be allowed to interfere with the quality of medical care received. More particularly, compensations and incentives must not be allowed to become other than spurs to better work. The series as a whole comprises a healthy introspective glance into the medical profession.

Best's Safety Directory of Safety, Hygiene, First Aid and Fire Protective Products. *Edited by Harry Armand and others. Second annual edition, 1948.* Fabrikoid. Price, $5. Pp. 494, with illustrations. *Safety Engineering Magazine, a Division* of Alfred M. Best Co., Inc., 75 Fulton St., New York 7, 1947.

This Directory, as recently announced by the Alfred M. Best Company's Safety Engineering Division, is unique in that it combines all the best practical features of a safety manual, directory, index, encyclopedia and catalogue into one comprehensive, profusely illustrated volume. It is the "what, how and where book of safety;" it shows what safety products or devices to use for specific hazards, how to use them and where to get them. Best's was the first safety directory published and is still the only one in the field. One outstanding feature of this book is its indexing and subject-grouping system. These devices—plus countless illustrations—make it easy to locate safety products even when the user is not certain of the type or name of the product he needs. The logical arrangement of subjects also serves as a checklist of hazards—many of which are frequently overlooked. This second annual edition will be appreciated by industrial physicians and surgeons, industrial hygienists, public health and safety officials.

Los Angeles County Hospital House Staff Manual. *Robert F. Nielsen, M. D., Editor in Chief.* John A. Wilson Jr., M. D.; Gordon E. Goodhart, M. D. and Herman Weiner, M. D., Assistant Editors. Fifth edition. Loose-Leaf. Paper. Price, $4. Pp. 525, with illustrations. Los Angeles County Hospital, 1200 N. State St., Los Angeles 33, 1947.

This manual is a comprehensive loose-leaf record of the therapeutic procedures that have been outlined by the Los Angeles County Hospital for the guidance of the interns and residents on the staff. There are detailed sections on respiratory and circulatory diseases; hematology; renal, digestive, hepatic and biliary diseases; endocrine and metabolic disorders; nutritional and deficiency changes; allergy; arthritis, and contagious diseases. Procedures commonly employed in dermatology, syphilology, pediatrics, psychiatry, neurology and obstetrics-gynecology are also described as well as those pertaining to general surgery, orthopedics, urology, ophthalmology and otolaryngology. Descriptive material is likewise included, with reference to minor therapeutic procedures, sulfonamide drugs, penicillin and streptomycin therapy, physical medicine, roentgen ray and laboratory procedures, dietary management, prescriptions and special drugs. Conversion tables for equivalent weights and measures are provided to facilitate the use of the metric system which has been instituted in the present edition in accordance with modern trends.

The manual is a valuable guide to interns and residents in their introduction to individual hospital services. It can also serve as a useful reference for other institutions planning to formulate new procedures or modify existing regulations.

A Synopsis of Anaesthesia. *By J. Alfred Lee,* M.R.C.S. L.R.C.P., M.M.S.A., Consultant Anaesthetist to Southend General Hospital, Rochford, England. Cloth. Price, $4. Pp. 254, with 42 illustrations, Williams & Wilkins Co., Mt. Royal and Guilford Aves., Baltimore 2, 1947.

This little book is well written and contains more information in fewer words than any other book on anesthesia. It covers material on the following subjects: history of anesthesia, respiration, preanesthetic care and preparation, premedication, inhalation anesthesia, agents for inhalation anesthesia, the closed circut, cyclopropane, controlled respiration, nitrous oxide anesthesia, accidents of inhalation anesthesia and how to treat them, gases used in association with anesthesia, endotracheal anesthesia, rectal anesthesia, basal narcosis, intravenous anesthesia, analeptics, spinal analgesia, regional anesthesia, refrigeration analgesia, choice of anesthetic as influenced by type of operation, choice of anesthetic and methods as influenced by general condition of the patient, the use of curare in anesthesia, shock, anesthesia in thoracic surgery, the complications and sequelae of anesthesia, explosion risks in anesthesia, management of the unconscious patient, anesthetic records and anesthesia and analgesia in labor.

Semiologia Cardiovascular. Por el Dr. Rafael Carral y de Teresa, medico del Instituto nacional de cardiologia de México, México, D.F. Cloth. Pp. 409, with 93 illustrations. Instituto nacional de cardiologia, México, D.F., 1947.

This book presents a summary of cardiovascular disease. It emanates from the National Institute of Cardiology of Mexico City. It is a good up-to-date survey of the field in which the author shows his familiarity with the literature. The book is divided into six parts. The first deals with the functional disturbances caused by cardiovascular disease, including dyspnea, cyanosis, pain and palpitation. The second part deals with abnormal hemodynamics such as are encountered in valvular disturbances and with an insufficient myocardium. A discussion is presented on elevation of venous pressure, edema, ascitis, circulation time, blood volume and arterial hypertension. The third part deals with the clinical examination of the heart. The fourth part deals with laboratory tests, such as determination of sedimentation time, serology tests and the examination of the blood. The fifth part deals with the roentgen examination of the heart. The sixth part deals with electrocardiography. This book should prove useful to the physician and medical student who can read Spanish.

Lehrbuch der Pharmakognosie für Hochschulen. Begründet Von George Karsten. Sixth edition, edited by Dr. Ulrich Weber, Apl. Professor, zur Zeit an der Universität Marburg Lahn. Boards. Pp. 428, with 585 illustrations. Gustav Fischer, Jena, Germany, 1946.

Although no effort is made to describe pharmacognosy in an introductory chapter, it immediately becomes obvious according to this textbook that pharmacognosy is the study of all vegetable drugs. Most of the emphasis has been placed on the botanical characterization of the drugs, especially their morphology and histology. The student using this textbook must be familiar with the fundamentals of descriptive botany. Though less attention is devoted to the constituents and uses of these drugs, nevertheless these data are brief and complete.

The drugs to be treated are arranged on a taxonomic and also on a morphologic basis. In the beginning the drugs are grouped under the thallophytes and pteridophytes. The spermatophytes are divided into a number of morphologic groupings such as rhizome and roots, tubers, woods, barks, herbs, leaves, flowers, fruits and seeds. Each of these groups is subdivided into monocotyledons and dicotyledons, and, finally, the drugs are listed and described under these respective classes. Other drugs without a definite morphology are grouped according to their method of preparation or the nature of their constituents. Information concerning each drug includes, with few exceptions, the origin, description of the whole drug, its histology, a detailed microscopic description, constituents, uses and history. The comments pertaining to the preparation of each drug are somewhat limited. Occasionally a paragraph is devoted to the cultivation of the drug plant. All of the numerous illustrations are exceptionally good line drawings exhibiting unusual care as to details, accuracy and labeling. Many of the figures are drawn in color to differentiate the various tissues and cells. Such impressive illustrations should serve as a valuable visual teaching aid.

The book contains an appendix which includes a list of drugs frequently used in homoeopathy in the foreign countries and a key which may be followed in the identification of powdered plant drugs. It also includes a list of the drugs under the various plant families which are arranged according to the Engler system, and a list of the drugs classified on the basis of their most important chemical constituent.

Apparently the scope of pharmacognosy in Germany is somewhat narrowed to the botanical study of drugs. It would be well if the next edition of this textbook included subjects closely related to the interest of pharmacognosy, such as the insecticides, herbicides and allergens. Since Germany is the source of many vegetable drugs for export, it would have been interesting to learn something about the factors which influence the commerce of drugs and more about the cultivation of drug plants.

If one were to make a thorough study of the botanical drugs in the laboratory with the aid of this textbook, he would become, without question, an expert in the identification of such drugs. The reviewer highly recommends to any technician in drug plant work and to all laboratories interested in the authenticity and identification of their drugs the use of this textbook as a valuable reference. The American teacher of pharmacognosy will do well to supplement his information by frequent reference to this book.

Studies in Biochemistry Dedicated to Professor Dr. Carl Neuberg, on the Occasion of His 70th Birthday, by Pupils, Friends, and Colleagues. Editor: Bruno Kisch, M.D. [Experimental Medicine and Surgery, Volume V, No. 2-3, 1947.] Cloth. Price, $10. Pp. 306, with portrait. Brooklyn Medical Press, Inc., P.O. Box 99, Station H., New York 25, 1947. 1947.

This book consists of a collection of nineteen papers prepared by former students of Carl Neuberg in honor of the 70th birthday of this noted biochemist. Dr. Bruno Kisch has edited the volume and prepared the introduction summarizing Dr. Neuberg's life and achievements.

The papers cover a wide range of subjects, among which might be mentioned a discussion on the immunity to Brucella abortus by Alberto Ascoli, loss of alkali as a cause of nephritic acidosis by A.P. Briggs, the toxicity of histidine by Gustav J. Martin and the determination of aspartic and glutamic acids by Irene S. Roberts.

It is difficult to see the usefulness of this volume other than as a gracious memento to an eminent scientist. In general, the quality of the papers is not high, and the subjects are of little general interest. The book is suitable only for workers in biochemistry and allied fields.

Causes of Blindness Among Recipients of Aid to the Blind. By Ralph G. Hurlin, Sadie Saffian and Carl E. Rice, M.D. Federal Security Agency, Social Security Administration, Bureau of Public Assistance. Paper. Price, 40 cents. Pp. 131. Supt. of Doc., Government Printing Office, Washington 25, D.C., 1947.

This report analyzes the causes of blindness of nearly 21,000 recipients of aid to the blind as taken from medical records in twenty states during 1940 and 1941. As a result of uniform procedures required as a condition of federal welfare grants, the Bureau of Public Assistance was able to collect comprehensive and comparable data on the causes of blindness of recipients in relation to their age, sex, race and age at onset of blindness. Standard definitions and classifications were followed by the states included in the study. The chief source of information was the physician's report of eye examinations required for each applicant for aid to the blind and containing a diagnosis of the eye condition, cause and nature of the defect, a report of remaining vision, prognosis and recommendation of treatment. Causes of blindness were classified according to site and type of pathologic condition and etiology of defect. When these tables are related, they yield statistics on the percentage distribution of recipients by cause for each site and type of affection and, conversely, by site and type of affection for each cause. Separate tables analyze etiologic data by states, age, sex, race and age at onset of blindness.

Despite the volume of information collected by the study, conclusions drawn from the data cannot be extended to the blind population as a whole. The sample group is unrepresentative, including only the needy, and underweighting blind children and blind persons 65 years of age and over, who receive aid under other public assistance programs. Taking this latter factor into account, the Bureau has adjusted its data by comparing the age distribution of recipients with persons found blind by the National Health Survey. The cause data suggest that more medical care could conserve or improve the vision of many recipients of aid to the blind.

Jaundice: Its Pathogenesis and Differential Diagnosis. By Eli Rodin Movitt, M.D., Acting Chief of Medicine, Veterans Administration Hospital, Oakland, Calif. Cloth. Price, $6.50. Pp. 261, with 25 illustrations. Oxford University Press, 114 Fifth Ave., New York 11, 1947.

This book presents clearly the problems met in the diagnosis of diseases associated with jaundice. In the first part the anatomic and functional changes found in the presence of jaundice are discussed. It includes a broad discussion of the normal and pathologic physiology of the liver, with a description of the basis and technic of the function tests in used Although indications and contraindications of the individual tests are not clearly defined, a successful attempt is made to combine them with clinical methods into an unified diagnostic approach. This part also contains an analysis of what little we know of the pathogenesis of jaundice. The shortcomings of this first section are caused by our still erratic knowledge of the physiologic basis of the function tests and of their application to the differential diagnosis of jaundice. Moreover, since, as yet, the correlation between anatomic and clinical findings in the liver is rather vague, the pathogenesis of jaundice is a thankless problem. The second section presents a review of the different diseases in which jaundice occurs. It reveals thorough knowledge of the literature as well as careful clinical observation and acumen. As cannot be avoided, some chapters are dealt with more sketchily than others; for instance, little reference is made to jaundice in childhood. The main emphasis is placed on diagnosis, and therapeutic considerations are kept in the background. As a whole, the book is written in a fluent and pleasant style and the well arranged tables help for quick orientation. The illustrations are well chosen. It should be of great value to the general practitioner, internist and surgeon who treat patients with jaundice. The value as a reference book for the student of the problem of jaundice is greatly reduced by the relatively small number of literature references, the simplification in the presentation of the newer advances and the omission of arguments where the facts are as yet unestablished. However, the latter two disadvantages may make for easier reading

Manual of Medical Parasitology with Techniques for Laboratory Diagnosis and Notes on Related Animal Parasites. By C. Courson Zeliff, M.S., Ph.D., Assistant Professor of Human Parasitology and Zoology, The Pennsylvania State College, State College, Pa. Paper. Pp. 159, with illustrations. Price, $3.75. The Author, State College. Pa. 1947.

This text has been prepared as a laboratory and reference guide for use by medical and nonmedical students taking an intensive course in parasitology. Numerous references are cited. and many well selected tables and illustrations have been reproduced from other publications. The latter in many instances have suffered from the photo-offset technic and lithographic reproduction which together with reduction in size render them difficult to interpret.

The biologic and morphologic material is well presented and the notes on parasites of animals are useful. Similarly the section on laboratory technics is a useful compilation. Unfortunately, the text is not free from misinformation; for example, the statements that Schistosoma mansoni is found in Central America and Loa loa in the West Indies. The brief reference to DDT (4,4'-dichlorodiphenyltrichloroethane) is inaccurate and inadequate. The volume is weakened by lack of competent medical editing.

The Industrial Environment and Its Control. By J. M. Dallavalle. Cloth. Price, $4.50. Pp. 225, with illustrations. Pitman Pub. Co., 2 W. 45th St., New York 19, 1948.

Facts regarding the industrial environment and control are presented in this book with an unusual clarity and logical development. Simplicity and precision characterize the discussion of critical details regarding exposures to excessive concentrations of dusts, fumes, mists, gases and vapors. There is an extensive discussion of exhaust ventilation as a means of control. In the words of the author: "As to the special emphasis on exhaust ventilation, I need only point out that practically all problems relating to atmospheric contaminants, and hence to industrial hygiene, are solved by ventilation methods." The book is divided into twelve chapters with an introduction by J. J. Bloomfield, senior sanitary engineer, U. S. Public Health Service, in which the scope of industrial hygiene is treated in a masterful way. The names of the chapter headings are as follows: Problems and Trends. Psychrometry. The Atmospheric Environment. Illumination and Radiant Energy. Noise, Vibration, and Fatigue. The Thermal Environment. Industrial Ventilation. Design of Local Exhaust Hoods. Design of Exhaust Systems. Measurement of Air Flow. Air Sanitation. Industrial Dust Collection.

In addition the book contains a well written preface, an appendix and index. Industrial hygiene engineers will welcome this volume and assign it a deserved niche in their libraries.

Die Diagnostik und Therapie des Nebennierenausfalls und das Krankheitsbild der relativen Nebennierenrindeninsuffizienz (Hypadrenie). Von A. Kappert [Erschienen in den Helvetica medica acta als Supplementum 20, Beilage zu Vol. 14, 1947, Fasc. 4/5.] Paper. Price, 8 Swiss francs. Pp. 192, with illustrations. Grune & Stratton Inc., 381 4th Ave., New York 16; Benno Schwabe & Co. Klosterberg 27, Basel 10, 1947.

This small monograph is a competent review of the diagnosis and treatment of adrenal cortical insufficiency. Without going into great detail as to basic physiology, sufficient applied physiology is included to illuminate the clinical discussion. The clinical concepts are similar to those which are current in this country, with the possible exception of the acceptance by the author of certain borderline syndromes as forms of adrenal cortical insufficiency. The references to the literature are ample and international in character. This volume should be of value to internists who have a special interest in disorders of the endocrine glands.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

RHEUMATOID ARTHRITIS

To the Editor:—Please give data on the latest treatment of rheumatoid arthritis following rheumatic fever of young adults

W. C. Terry, M.D., Hamlet, N.C.

ANSWER.—Although there is no reason why rheumatoid arthritis should not follow rheumatic fever in the same person, proved cases of this combination are difficult to find. In most instances when rheumatic fever is believed to precede the development of a progressive joint disease consistent with rheumatoid arthritis, the patient has actually had an atypical acute or subacute first attack of rheumatoid arthritis. Another less likely possibility is that the patient is suffering from an adult type of rheumatic fever, without evidence of carditis and with unusually prolonged articular manifestations. Treatment, of course, depends on the final diagnosis. While this is still uncertain, the patient should be confined to bed, receive a well balanced diet and be given salicylates in as large doses as can be tolerated. The joints should be watched for the development of persistent changes, in which case the diagnosis is presumably rheumatoid arthritis. A review of the current status of therapy in both rheumatic fever and rheumatoid arthritis has recently appeared (Hench, P.S., and others: *Ann. Int. Med.* 28:66-168, 1948.)

BIRTH CONTROL

To the Editor:—I have literature on a so-called "rhythmeter," which is supposed to be accurate in predicting rhythm control of pregnancy and also useful in more accurately predicting births. The American Medical Association is quoted in this material. Are these statements correct? Has this system been tried and how successful has it proved? I have always been skeptical of it and have only advised it for families who are not allowed to use other methods. This article claims that it is better than the conventional methods. Please give information in this matter.

Alvin H. Seibert, M.D., Grosse Pointe Park, Mich.

ANSWER.—The greatest exponents of the rhythm, or Ogino-Knaus, theory in this country are Latz and Reiner (J.A.M.A. 105:1241 [Oct. 19] 1935). They set forth following rules:

1. A written record is made of the dates of the beginnings of menstrual periods covering a period of at least eight months to one year before applying the method. This is necessary to determine the variation between the shortest and the longest cycle. Patients should also be instructed to record disturbing factors that may upset the regularity of menstruation, such as sickness (even colds), mental shock or upset, physical strains and even great changes in climate or altitude. This will enable the physician to make an intelligent interpretation of the data given. Data furnished by memory are of no value.
2. Sexual intercourse during the time of possible conception is prohibited.
3. Regularity in menstruation must prevail. The menstrual cycle may be either long or short, but the variation should not be more than ten days; a longer variation would make the use of the method impracticable. However, according to Latz and Reiner, 90 per cent of women have variations of from two to eight days regardless of whether their cycles are short or long, and therefore they maintain that most women menstruate regularly enough to make use of this method of natural conception control.
4. After these three rules have been satisfied, the woman is told that her fertile period extends from the twelfth to the nineteenth day before her expected menstruation (the expected first day of menstruation being calculated from the longest cycle in the last eight months) plus the days of variation between the longest and the shortest cycle in the last eight months added to the beginning of the fertile period. For example: Suppose a woman has varied between a twenty-six and a thirty day cycle in the last eight months. Then her first seven days, counting from the first day of menstruation, are sterile. The next twelve days (eight days of regular fertility plus the four days of variation) are fertile. The patient is then asked to record conscientiously on a calendar the day of each intercourse as well as the first day of each menstrual period.

This method of birth control should not be used: (1) after labor, miscarriage or abortion until the regularity of the cycle is reestablished (usually in three to six months); about 50 per cent of women menstruate irregularly after childbirth; (2) after febrile or debilitating diseases or severe physical injuries. (3) after severe psychic or emotional upsets, or (4) after any drastic alteration in the ordinary routine of life, such as prolonged travel in a different climate and strenuous exercises. During and after these unusual occurrences, the method should not be used until regular menses have been definitely established.

J. P. Greenhill (*Office Gynecology*, ed. 4, Chicago, Year Book Publishers, 1946, p. 223) says: Unfortunately, the safe period of conception control cannot be applied as universally as its proponents believe. In the first place, only 80 per cent of women, at most, menstruate with any degree of regularity which will permit calculation of a fertile period. Certainly not more than 60 per cent of all women menstruate approximately every twenty-eight days. Second, a large proportion of women at more or less periodic intervals encounter the contraindications enumerated by Latz and Reiner. Thus, most women at various times have full term pregnancies or miscarriages, minor or major illnesses, psychic or emotional upsets or they take trips to other climates. Third, certainly not all, or even the majority of women ovulate on the fifteenth day before every menstrual period. Many women ovulate a few days before or after this date....An objection to the Ogino-Knaus method raised by many couples, particularly recently married ones, is that there is an excessively large number of days each month when coitus cannot be indulged in. In some cases less than half of each month is safe or convenient for coitus.

Latz and Reiner present a useful chart which shows the fertile days each month for women who menstruate from twenty-one to thirty-eight days apart. A number of mechanical devices, of which the "rhythmeter" is one, have been designed to help physicians and patients determine the fertile days in each month, but these devices are not necessary.

MENOPAUSAL ARTHRALGIA

To the Editor:—I have seen 3 women recently, all of whom complain of being awakened at night with severe pain in both hands. The pain is so severe that they are obliged to get up and walk around shaking their hands until they obtain some relief. Sometimes the hands are swollen but the color does not change. Bathing the hands in warm water gives little or no relief. Physical observations are noncontributory. The women are all between the ages of 38 and 45. Is this a manifestation of so-called menopausal arthritis? I would appreciate suggestions as to treatment.

H. V. Temple, M.D., Oak Creek, Colo.

ANSWER.—Exquisite pain in the fingers, occurring especially at night, has been described by Hall (*New England J. Med.* 219:1015-1026, 1938) in patients with articular symptoms following the menopause. The suggestion was made by this author that the pain was due to vascular spasm. Similar pain, however, is not uncommon in the early stages of rheumatoid arthritis. The presence of other symptoms and signs commonly associated with the menopause would add weight to the opinion that menopausal arthralgia was present. A trial of oral or parenteral estrogenic therapy in adequate dosage is indicated, but the final diagnosis will probably depend on further observation.

DIETHYLSTILBESTROL

To the Editor:—A man aged 72 had an enlarged prostate. He took diethylstilbestrol, 5 mg. a day for about twenty days. Then it began to nauseate him a little and he stopped. As a result of the medication the prostatic difficulty improved considerably, but about ten days later he noticed that he had a slight enlargement of both breasts with some soreness and slight pain on palpation. This hyperplasia of the breasts was fibrotic in character—a disk about the size and thickness of a quarter developed underneath each nipple—rather hard, like cartilage, to the touch and sensitive, the nipple especially, with a moderate degree of soreness of the disk underlying the nipple. This condition of the breasts has continued for three months. Will this abnormality clear up, since the diethylstilbestrol therapy has been discontinued? Might it be cancer initiated by the treatment, possibly due to the rather large doses taken? The literature on this drug suggests that it has been given in much larger doses over extended periods without serious after-effects.

C. C. Townsend, M.D., Walnut Ridge, Ark.

ANSWER.—Diethylstilbestrol is indicated only in the presence of carcinoma of the prostate gland. The patient should be observed at intervals while on stilbestrol therapy, because of the many and varied reactions to this medication. Besides the decrease in size of the carcinoma and its metastases, one also notes enlargement of the breasts, salt and fluid retention, dyspepsia, atrophy of the testicles and hypertrophy of the pubic fat pad.

Cancer of the male breasts is not a well established sequela of diethylstilbestrol therapy. However, such a case was reported this year. Refer to the *Journal of Urology* (59: 76 [Jan.] 1948) for the explanation of this situation and an excellent bibliography of diethylstilbestrol therapy for carcinoma of the prostate.

CANCER OF THE BREAST

To the Editor:—In THE JOURNAL, Jan. 31, 1948, page 305, Cornelius P. Rhoads, M.D., makes brief reference to the use of testosterone and diethylstilbestrol for metastatic cancer of the breast. A woman patient, 67, had a carcinoma of the breast removed eighteen months ago. The tumor had invaded the anterior wall of the chest, so that the pectoralis major was adherent to the ribs and intercostal tissues, due to the carcinomatous infiltration. The pathologic diagnosis was carcinoma of the simplex or medullary type with regional metastases. The patient is still apparently well, and no growth of the remaining malignant growth was palpable until recently, when a hard nodule became palpable high in the axilla, which seems to be adherent to a rib. On the anterior chest where widespread pieces of malignant tissue were left signs of recurrence are absent. Should this patient be treated with either testosterone or diethylstiobestrol? She has not had roentgen therapy, and roentgenograms do not indicate metastasis.

ANSWER.—The choice of the sex hormone to be tested therapeutically in inoperable mammary cancer in female patients is dependent on two principal factors: the age of the patient and the site of the metastatic cancer. Female sex hormone is used exclusively in patients several years past the menopause, whereas male sex hormone is used without reference to the age. Female sex hormone is the empiric choice in the presence of nonosseous metastases (lymph node, skin, breast), while male sex hormone is preferred in the presence of osseous metastases.

In the case of the patient in question further clinical studies are indicated. Roentgenograms of the lungs, ribs and other bones should be made to establish the extent of the metastatic involvement. Pelvic examination should be made in order to rule out concomitant pelvic disease which might preclude the use of estrogen.

If the decision is made to try sex hormone, rather than conventional roentgen therapy, then the choice, whether estrogen or androgen, will depend on the relative clinical importance of the metastases in the various sites.

GOLD THERAPY

To the Editor:—A patient has been taking the gold treatment for chronic arthritis for some months and apparently was much helped thereby. But recently he has had a sudden hemorrhage from the throat, repeated twice after he reached the hospital. Is there any record of gold having caused such hemorrhages?

George A. Skinner, M.D., Berkeley, Calif.

ANSWER.—"Sudden hemorrhage from the throat" is not a reported complication of chrysotherapy, although toxic effects on the hemopoietic system resulting from the use of gold salts have produced hemorrhages in the intestines, brain and skin. D. E. McKenna (discussion, *New York State J. Med.* 36: 1530-1531, 1936) has reported febrile epistaxis of severe degree in 2 cases and of mild degree in 6 cases of a total of 26 cases in which toxic reactions to chrysotherapy were manifest. Before assuming that the hemorrhages from the throat in this case were actually related to the chrysotherapy, one must exclude the presence of certain other conditions, such as esophageal varices, varices at the base of the tongue, small localized nasopharyngeal ulcers, hemangiomas and superficially placed arterioles. The results of a thorough examination along these lines, the type of gold preparation, the dosage schedule and the total amount received by the patient must be known before an opinion can be given concerning the cause of the hemorrhage from the throat in this case. Also, estimation of the hemoglobin and bleeding time and counts of the erythrocytes and platelets should be made.

Hemorrhage related to toxic effects of chrysotherapy on the hemopoietic system may result from thrombocytopenic purpura, agranulocytosis or aplastic anemia. The toxic reactions may be mild, serious or fatal. Most commonly encountered is thrombocytopenic purpura, which, when promptly recognized, is usually not a serious complication; however, grave reactions and death have occurred. Other reported deaths have resulted from multiple cerebral hemorrhages, agranulocytosis and aplastic anemia. When toxicity is suspected or confirmed, it is imperative that chrysotherapy be promptly discontinued (either temporarily or permanently), as most reactions are controlled thereby. Although no specific antidote for the toxic reactions from chrysotherapy is known, penicillin is effective in preventing serious secondary infectious processes that might otherwise unfavorably complicate the course of agranulocytosis (Boland, E. W.; Headley, N. E., and Hench, P. S.: The Treatment of Agranulocytosis with Penicillin, *J.A.M.A.* 130: 556-559 [Mar. 2] 1946) or aplastic anemia. Recently 2, 3-dimercaptopropanol (BAL, British anti-lewisite) has been used for treatment of toxic reactions from various heavy metals, including gold (Cohen, A.; Goldman, J., and Dubbs, A. W.: The Treatment of Acute Gold and Arsenic Poisoning; Use of BAL [2, 3-Dimercaptopropanol, British Anti-Lewisite], *J.A.M.A.* 133:749-752 [Mar. 15] 1947. Ragan, C., and Boots, R. H.: The Treatment of Gold Dermatitides; Use of BAL [2, 3-Dimercaptopropanol], ibid. 133:752-754 [Mar. 15] 1947. Lockie, L. M.: Norcross, B.M., and George, C.W.: Treatment of Two Reactions Due to Gold; Response of Thrombopenic Purpura and Granulocytopenia to BAL therapy, ibid. 133:754-755 [Mar. 15] 1947).

Although much information regarding chrysotherapy has been accumulated in recent years, this treatment still involves acceptance of risks which are potentially serious. These risks are justified when rheumatoid arthritis is progressive and unrelieved by adequate trial of safer methods of treatment, when the patient understands and accepts the risk and when the physician has fully acquainted himself with chrysotherapy before accepting responsibility for its use.

COLA AND ASPIRIN

To the Editor:—Several of my patients have informed me that they have experienced a "jag," or sort of intoxication, from drinking "coca-cola" fortified by the addition of acetylsalicylic acid. My first reaction was to doubt the existence of such a physiologic reaction to the combination of these two relatively harmless ingredients, but I was assured that it was a true intoxication. I would like to know if there is such a reaction, and if so, to what is it due and is it harmful? Frank E. Nagel, M.D., Chicago.

ANSWER.—The only active ingredients in "coca-cola are caffeine (approx. 60 mg., 1 grain, in the Northern states and 120 mg., 2 grains, in the Southern states) and phosphoric acid. The combination of acetylsalicylic acid or other coal tar analgesics with caffeine is common in proprietary remedies for the relief of mild types of pain ("empirin," "bromo-seltzer," "stanback" and "B.C."). A portion of the analgesia produced by this combination results because headaches are often due to an irregularity in caffeine intake, which will result in caffeine-withdrawal headache (Dreisbach, R. H., and Pfeiffer, C.: *J. Lab. & Clin. Med.* 28: 1212, 1943). This is typified by the patient who has a headache if he does not obtain his morning cup of coffee. Caffeine alone is specifically analgesic in this type of headache but does not raise the normal pain threshold in the normal subject (Hardy, J. D.; Wolff, H. G., and Goodell, H.: *J. Clin. Investigation* 20:63, 1941).

Changes in mood as a result of acetylsalicylic acid and caffeine are extremely difficult to evaluate. Since experimenters in this field have given relatively enormous doses of these two drugs to normal subjects and have not observed such changes, the reports of the patients in this instance may be due to an unusual sensitivity to the drugs or to the initial presence of an abnormally dull mood precipitated by lack of caffeine in the habituated subject. A third possibility may be that this combination has taken the place of the older "ammonia coke," which consisted of a drop or two of dilute solution of ammonia in a "coca-cola" and was at one time falsely regarded by the laity as highly stimulant. This would place the observation in the category of an overrated fad of the laity.

TRAUMA AND CIRRHOSIS

To the Editor:—An Italian man, aged 56, has unequivocal clinical and laboratory evidence of cirrhosis, his chief complaint being ascites. Shortly preceding the onset of his illness he had a fair degree of trauma over his hepatic area. The patient has led an exemplary life, is not an alcoholic addict, has followed a good diet and has never had any evidence of hepatic disease (e.g., jaundice) previously. Is there any possible relationship between the cirrhosis and the trauma?

Franklin K. Paddock, M.D., Pittsfield, Mass.

ANSWER.—In any large series of patients with cirrhosis, the physician frequently encounters some who have had no exposure to alcohol, hepatotoxic agents or dietary errors and who do not give a history of infectious jaundice. In such patients the basic cause of the process remains obscure. External trauma to the abdomen in the vicinity of the liver is not believed to be of any etiologic importance in the production of cirrhosis, there being no reported instances in which the disease followed injury alone. Lacerations of the liver, subcapsular hematomas and the like have been reported to follow trauma, but they usually leave no important residues. An exception must be made in the rare cases in which deep lacerations seriously interfere with the blood supply and produce massive areas of necrosis. In such cases the termination usually is fatal within a matter of a few days.

THUMB SUCKING

To the Editor:—A girl aged 8 years has been sucking her thumb since infancy. Her dentist stated that it was responsible for malocclusion. In order to correct this he desires that measures be taken to stop the habit. What trauma to the personality may result from forceful or psychiatric measures to arrest this habit? Is there any dental, medical or psychiatric contraindication to allowing this habit to reach a natural termination?

M.D., Georgia.

ANSWER.—Many dentists and physicians believe that in persistent thumb sucking there may occur malocclusion characterized by a bending down of the anterior mandible, the lower incisors being bent backward and the upper incisors pushed forward. Of course, it is well known that many children have malocclusion without ever having practiced thumb sucking and, conversely, that in not a few persistent thumb suckers malocclusion never develops. One cannot, on the basis of present knowledge, flatly contradict the assumption that malocclusion is caused by this habit, though, on the other hand, the proof that it causes deformities of jaws and teeth is not altogether convincing.

The thumb-sucking habit is acquired during the early months of life and most often disappears in preschool age. If the habit persists after the twelfth month, it is, to say the least, undesirable. If it continues after the sixth or seventh year, psychiatrists say that it is a manifestation of a general emotional immaturity. An attempt should certainly be made to help this child of 8 years to correct this habit. Harsh methods should not be employed; intelligent kindly treatment should be tried. While most infantile thumb suckers desist from the habit early in life, it may be said confidently that the older the child, the more fixed the habit and the more difficult it is to cure. In the case of a patient 8 years of age it is late to expect a natural or spontaneous termination; as has already been stated, the child needs help.

PREVENTATIVE

To the Editor:—We have had a discussion on the use of the word "preventative." We are familiar with the word "preventive," but is there such a word as "preventative?"

ANSWER.—We prefer the word "preventive" as applied in the term "preventive medicine" and for all other purposes. The Oxford Dictionary indicates under the word "preventative" that it is an alternate word which came into use about 1654, whereas preventive came into use in 1639. According to Fowler's "Modern English Usage," which is considered to be the greatest authority, the short term "preventive" is preferred for all purposes. According to Opdycke, whose book "Don't Say It" is a well recognized authority, preventive "is both adjective and noun, meaning precautionary or stopping or tending to prevent." the word preventative, he says, is "a corrupt but still widely used term."

ANTIGENIC POLISHES

To the Editor:—Is there a nonantigenic furniture polish? Which brands are recommended?

Clifford H. Kalb, M.D., Milwaukee.

ANSWER.—Polishes designed for use on wooden furniture contain soap or other alkalies, oils and waxes. Polishes for metals contain abrasives and solvents also. All these materials are capable of producing dermatitis in susceptible persons and, unfortunately, there is still no satisfactory substitute for these potential cutaneous irritants.

USE OF STAINLESS STEEL IN COOKING

To the Editor:—Kindly state the advantages and disadvantages of cooking with stainless steel pans, waterless.

Louis F. Waldmann, M.D., Waukegan, Ill.

ANSWER.—Stainless steel represents no fixed alloy composition and may represent 18 per cent chromium and 8 per cent nickel, the remainder being steel. However, there may be a minor constituency of silicon, columbium, manganese and/or beryllium. In any event, these metals provide no exposure for the user. Food acids attack stainless steel little and mineral acid scarcely more. Phosphoric acid is more active in attacking such utensils. Stainless steel is more durable than aluminum but, in truth, is not permanently stainless. Its bright surfaces reflect heat, which suggests that the bottom should be allowed to become blackened or should be deliberately blackened. Stainless steel is a poor conductor of heat, so that localized points of heat might interfere with cooking. To overcome this some manufacturers introduce a second bottom of copper as a heat conductor, but obviously this adds to the cost. Cast iron utensils are more easily attacked by chemicals within foods and may provide enough dissolved metal to impart unwanted taste. Notwithstanding, many old-timers continually regard the the passing of the cast iron cooking pot as a major gustatory defeat.

"Waterless" cooking is a catch phrase to emphasize "a little water." Some vegetables contain enough water to require none in addition; the majority require a fraction of an inch of water. Obviously, an egg boiled in a gallon of water requires more fuel than the same egg boiled in an ounce of water Equally obvious, the loss of vitamins and minerals increases in copious quantities of cooking water. For example, cabbage cooked in much water retained 54 per cent of its ascorbic acid. The same cabbage cooked in a minimum of water retained 84 per cent of its ascorbic acid. However, for snap beans and potatoes no differences are measurable from the two methods of cooking. Ordinarily cooks prefer little water in order to conserve the shape of certain vegetables, such as cauliflower. Further, it is obvious that more time in addition to more fuel is required to heat up a large amount of cooking water. All considered, the waterless cooking appears to have substantial merit as a vitamin-mineral saver, a fuel saver, a time saver and an appearance saver.

HYPOTHYROIDISM

To the Editor:—Please let me know the present status of use of a thyroid in a mildly overweight man aged 41 (10 to 15 pounds, 4.5 to 6.8 Kg.) with a basal metabolic rate of minus 25 per cent but no true hypothyroid symptoms. There is also a moderately elevated blood cholesterol level. Should a low cholesterol diet be prescribed in the hope of minimizing early arteriosclerosis? (The patient's father died at 54 years of age of coronary thrombosis.) If a low cholesterol diet is recommended, what foods should be eliminated?

M.D., Connecticut.

ANSWER.—The use of thyroid extract cannot be recommended for the treatment of obesity in which hypothyroidism is not the etiologic agent. However, the low basal metabolic rate and the elevated blood cholesterol level suggest that, as sometimes happens, this patient is suffering from hypothyroidism without obvious clinical symptoms. Determination of the bound protein iodine of the blood might be helpful as an additional objective criterion. If the last mentioned is not available, thyroid extract may be administered as a therapeutic test. If the basal metabolic rate reacts sensitively to the administered thyroid and if the blood cholesterol level decreases to the normal range, it may be concluded that the patient has hypothyroidism and that the thyroid extract should be continued on a treatment basis. But if the basal metabolic rate shows little or only temporary rise with small or moderate doses of thyroid extract (1 to 2 grains [0.06 to 0.13 Gm.] per day) and if the cholesterol level doses not fall, the thyroid should be discontinued.

In the absence of a specific endocrine disturbance, the only sound treatment for obesity is the restriction of the total caloric intake. This must be continued until the proper caloric intake becomes a well established habit with the patient. As regards the relationship of the blood cholesterol level and the development of arteriosclerosis, evidence to date does not reveal any clear connection. Hence, despite some suggestions that such a connection exists, it is hardly warranted to impose the inconveniences of a low cholesterol diet on patients until more definitive evidence of a casual relationship is available.

SESAME OIL

To the Editor:—Please give information on the fate of the sesame oil in sesame oil preparations when injected intramuscularly and subcutaneously. Is there any hazard in the long-continued use of such preparations, especially penicillin in sesame oil which would be given once daily over a period of from one to three or four months?

ANSWER—Sesame oil preparations injected intramuscularly cause minor local reaction and are broken down readily into minute oil cysts by the action of the muscle. When they are given subcutaneously, diffusion occurs through the subcutaneous tissues, and because of this localization considerable inflammatory reaction with local pain occurs. When administration is intramuscular, the minute oil cysts which are formed usually disappear in from ten days to several weeks. The action of the muscle tends to collapse these minute cysts, so that biopsy material, when obtained at approximately a two- to three-week interval after injection, rarely shows any residue. Injections of sesame oil could be given daily for protracted periods of time if given intramuscularly and at different sites. The minor hazards which might occur are sensitivity to the penicillin and rarely to the oil. It is advisable to question patients as to penicillin or sesame oil sensitivity prior to injection.

BIRTHMARKS

To the Editor:—A patient has a port wine birthmark occupying a large part of the left side of his face and neck. I believe that at the annual meeting in Atlantic City, N. J., last year a paper was read which suggested use of a tattoo procedure. Could you give me any information regarding this problem.

J. C. Lee, M.D., Indiana, Pa.

ANSWER.—Usually port wine marks are not treated because the results are less than satisfactory and and they can be hidden successfully by covering with a cosmetic preparation such as "covermark." The lesions are often irregular in shape and color, so that treatment with the usual destructive measures, such as radiation or solid carbon dioxide, leaves a mottled appearance which still constitutes a cosmetic problem. Grenz rays are said to produce some improvement, particularly when used in infancy, but experience with Grenz rays has not been extensive.

Recently H. Conway and J. P. Doktor (*Surg., Gynec. & Obstet.* 84:866 [April 15] 1947) reported on a method of treatment by tattoo wherein permanent pigments were tattooed into the nevus. This article described the technic and illustrated the results of the treatment with photographs.

THE VAGINAL SMEAR

Its Value to the Internist, with Report of Diagnosis of Unsuspected Uterine Cancer in Four Cases

MAURICE FREMONT-SMITH, M.D.
and
RUTH M. GRAHAM, B.S.
Boston

The vaginal smear has been established as a valuable aid in the diagnosis of uterine cancer.[1] While neither biopsy nor vaginal smear will disclose all cases of malignant uterine growth, the two methods used in conjunction have been shown to make diagnosis possible in 98 per cent of 181 cases.[2] In our hands the vaginal smear has proved of unique value in the detection of carcinoma of the cervix in the early (noninvasive) stage.[3] Gates and Warren,[4] in a recent critical evaluation, stated, "Even taking into account differences in criteria, these figures suggest a distinct advantage in favor of the smear method" in the detection of carcinoma in situ of the cervix. In 1943, our associates and we[1d] emphasized the value of the vaginal smear as a screening procedure for the discovery of early uterine cancer and advised "incorporation of this method of diagnosis as a part of every routine physical examination in office, outpatient department, and hospital."

During the early investigation of the method (1943 to 1946), smears were made by an internist (M. F.-S.) for 23 office patients in whom, because of symptoms or abnormal pelvic findings, uterine cancer was suspected. In this group, positive vaginal smears were obtained on 7 women, 6 of whom were later proved to have cancer.[5] For the seventh patient, whose smear was reported to be positive in 1943, repeated biopsies since that time have not revealed malignant tissue, and all subsequent smears have been negative for carcinoma. This case represents a mistaken positive diagnosis made when we were as yet unable to distinguish, in a few instances, between atrophic basal cells and cancer cells.

Beginning Jan. 1, 1946, a single routine smear was taken in the office for almost every female patient, irrespective of the presenting symptom. To date, 200 women have been screened by this method. Of the 200 patients, 21 presented gynecologic symptoms; only 14 complained of abnormal bleeding or discharge. The age span of the group was 18 to 81 years, with an average of 42 years.

Of the 200 smears 183 were negative for cancer, 7 were doubtful; 5 were unsatisfactory, and 5 were positive for cancer. Of the 5 women whose smears were positive, cancer was present in 4 (carcinoma in situ of the cervix in 3; adenocarcinoma of the endometrium in 1). Histologic sections from the cervix of the fifth woman whose smear was positive were examined by two pathologists. Although both examiners agreed that the tissue showed suspicious evidence of carcinoma, neither would make a positive diagnosis of cancer from the material available. Of the 7 women whose smears were doubtful, 1 was found to have carcinoma of the bladder, for 2 repeated smears were negative, and on 4 no follow-up observation was possible. Two of the 4 proved cases have been included in previous reports.[7] Brief summaries of the 2 unreported cases follow:

M. P., a single woman aged 62, came for examination because of fatigue and exhaustion. There had been no vaginal bleeding or discharge. A paternal aunt had died of uterine cancer.

The cervix was soft and normal on inspection. The fundus was anterior and normal in size; the vaults were clear. The normal condition of the pelvis was confirmed by Dr. J. V. Meigs.

The vaginal smear was positive for epidermoid carcinoma.

With the patient under anesthesia, Dr. Meigs completely excised the os with a knife (to obtain a biopsy specimen) and performed a total hysterectomy. The pathologic diagnosis made by Dr. Tracy B. Mallory was carcinoma in situ of the cervix.

A. McC., a married woman aged 65, whose menopause had occurred twenty years before, came to the office complaining of pain in the back of the head and radiating to the elbows. For several years she had been given weekly injections of estrone U.S.P.("theelin") On direct questioning, she stated that there had been spotting on one occasion two weeks previously.

Examination showed a cervical polyp, and the cervix was described as suggestive of carcinoma. One vaginal smear was doubtful; a second was positive for cancer. From material obtained at curettement a diagnosis of adenocarcinoma of the endometrium was made. The diagnosis was confirmed on pathologic examination following hysterectomy.

Of the 3 women found to have cervical cancer, 2 had had no bleeding or discharge; the third had bled for a single day after estrogen therapy given for arthritis, which had been her presenting symptom. In all pelvic

[7] Fremont-Smith and others.[3] Meigs.[6c]

examination revealed nothing abnormal. The patient harboring adenocarcinoma of the endometrium came to the physician with the sole complaint of pain in the head. She had received estrogen therapy for several years and admitted having had vaginal bleeding for one day two weeks before. This case is the second of endometrial cancer occurring during prolonged estrogen therapy to be reported by us.[8]

It is well known that in the majority of cases carcinoma of the cervix is discovered too late for effective treatment surgically or with radiation. Maliphant,[9] reporting on 837 women with cervical cancer treated with radium, stated that 60 per cent of patients seen six months after the onset of vaginal bleeding showed advanced cervical cancer. Only 1 patient in 10 received treatment within three months of the onset of symptoms. Of this group of women, more than 50 per cent had advanced carcinoma of the cervix.

We have previously discussed the evidence indicating that cervical carcinoma exists for months or years before any symptom or sign is apparent.[3] If this concept is valid, early cases will not often be discovered by the gynecologist, as women do not usually consult a specialist until symptoms are present. Thus it may be the responsibility of the internist to detect the early cases of cervical cancer before symptoms appear and at the stage of the disease when cure is most certain. Screening by means of vaginal smear is at present the only practical way of discovering carcinoma of the cervix in the very early stage. All patients with a positive smear deserve immediate and multiple biopsies. Although we believe that a final diagnosis of cancer can be accepted only after study of fixed tissue sections, there are, nevertheless, occasions when, with the full understanding of the patient, hysterectomy may be justified on the basis of repeated characteristic positive vaginal smears, even when biopsy shows no evidence of malignancy. Early carcinoma of the cervix is not infrequently discovered in tissue sections made after hysterectomy when even multiple preoperative biopsies have failed to demonstrate its presence.[3] The converse, a negative vaginal smear and positive biopsy evidence, has also been observed.[2]

SUMMARY

Two hundred unselected office patients were screened for uterine cancer by examination of the vaginal smear.

Smears positive for cancer were obtained for 5 patients. For 3 of them the diagnosis of carcinoma in situ of the cervix, and, for 1 that of adenocarcinoma of the endometrium, was made by the pathologist. For the fifth woman with a positive smear, the presence of cancer was not proved.

Two of the 3 women with proved early cancer of the cervix gave no history of abnormal bleeding or discharge. In all 3 patients pelvic examination had shown nothing abnormal.

Unsuspected cancer of the uterus was diagnosed in 2 per cent of 200 unselected office patients with the use of the vaginal smear as a screening procedure.

Note.—Since this paper was written, a further 108 women have been screened by vaginal smear. One positive smear was obtained from a woman without symptoms and with normal pelvic findings. Microscopic examination following hysterectomy confirmed the diagnosis of carcinoma in situ of the cervix.

CLINICAL COURSE OF CHRONIC NONSPECIFIC ULCERATIVE COLITIS

JOSEPH B. KIRSNER, M. D.
WALTER LINCOLN PALMER, M. D.
S. N. MAIMON, M. D.
and
W. E. RICKETTS, M. D.
Chicago

The literature pertaining to nonspecific ulcerative colitis continues to emphasize the widely varying concepts of its pathogenesis and treatment.[1] Although considerable attention has been directed in the past decade to the effects of antibiotics[2] and to the results of surgical therapy,[3] observations on the natural history of this disease have been comparatively infrequent.[4] It seemed of interest, therefore, to review the clinical features and course of nonspecific ulcerative colitis in an illustrative series of 100 patients. The cases were chosen from a group of approximately 250 by the following criteria: completeness of data, length of the period of observation and accurate information as to their present status. There were 14 deaths. Sixty-five of the 86 surviving patients have been reexamined since Jan. 1, 1947; the remainder were restudied in 1946. Because of the method of selection of material to be used in this report, the number of patients requiring surgical treatment and the mortality rate in the series are probably higher than would have been the case if we had been able to report on the course of the entire group.

AGE AND SEX

The distribution of patients by sex and by age at the onset of symptoms is shown in table 1.

TABLE 1 - *Age and Sex*

Decade	Male	Female	Total
1-9	3	-	3
10-19	7	17	24
20-29	17	21	38
30-39	12	9	21
40-49	7	4	11
50-+	2	1	3
Total	48	52	100

In common with other reports, the incidence in this series is almost equal for the two sexes. Persons between the ages of 10 and 40 were most often affected. It is to be noted, however, that in 3 patients the disease developed before the age of 10 and in 3 patients after the age of 50.

DURATION OF DISEASE

The duration of symptoms at the time of initial admission to this hospital was less than twelve months in 33 patients and more than ten years in 14. The period of continuous observation was less than one year in 28 patients, including 10 of the patients who died; it ranged from one to four years in 31, including 4 who died; it exceeded five years in 41 patients.

Table 2 again emphasizes the high mortality during the initial one or two years of illness, and the extremely low death rate among persons with prolonged symptoms.[5] The duration of illness was less than twelve months in 3, and between twelve and twenty-eight months in 6 of the 14 patients who died.

ONSET

The onset of symptoms was insidious in 59 patients and sudden in 41, including 3 with fulminant, rapidly fatal illnesses.

POSSIBLE CONTRIBUTORY FACTORS

The circumstances preceding the onset of the disease were recalled by 39 patients. Twenty-six apparently had been subjected to various emotional stresses, often involving the death or separation of parents, marital problems and disruption of the home. Six of this group had experienced recurrent bouts of diarrhea precipitated by nervous tension. In 1 male patient, diarrhea appeared at the age of 2 years and 6 months, when his bowel habits were being regulated. Among the remaining 13 patients, 4 related the abrupt onset of diarrhea to infections of the upper respiratory tract. Three ascribed their illness to "food poisoning." The onset was abrupt in 2 patients after the use of cathartics, and in 2 persons after appendectomy and hemorrhoidectomy, respectively. In 2 patients, the symptoms first appeared during pregnancy.

TABLE 2 - *Duration of Symptoms (At Most Recent Visit)*

Duration, Years	Cases	Deaths
Less than 1	5	3
1-4	25	8
5-9	33	2
10-14	20	-
15-20+	17	1

The close chronologic association between emotional stress and the onset of symptoms in 26 of 39 patients supports the observations of Murray,[6] Sullivan[7] and Daniels[8] and suggests that the relationship may be more than casual.

SYMPTOMS AND PHYSICAL FINDINGS

The symptoms usually consisted of bloody diarrhea, cramping abdominal distress, rectal tenesmus, fever, anorexia and weakness. Profuse rectal bleeding occurred in 12 patients. The loss of weight exceeded 25 pounds (11.3 Kg.) in 47 cases. The physical findings, except in the more seriously ill patients, were not conspicuous. Pronounced tenderness over the colon was demonstrated in only one fourth of the series. Evidence of loss of weight was noted in 44 patients, being pronounced in 31 of these.

PROCTOSCOPY

The appearance of the rectal mucosa was interpreted as typical of nonspecific ulcerative colitis in 95 cases. The mucosa was normal in 3 of the 4 patients with segmental colitis, and it was mildly inflamed in the fourth case. In the 1 patient not examined, the diagnosis of nonspecific ulcerative colitis was confirmed at autopsy. The proctoscopic findings did not parellel the clinical course directly, for a severely inflamed mucosa not infrequently was observed in patients with comparatively mild symptoms.

DIFFERENTIAL DIAGNOSIS

The diagnosis of nonspecific ulcerative colitis was further established by the exclusion of specific etiologic agents known to produce a similar clinical picture. The absence of dysentery organisms from cultures of the stools and the negative results of agglutination tests presumably eliminated the possibility of bacillary dysentery. Amebiasis was excluded by the absence of Endamoeba histolytica from the stools. The reaction to the Frei test for venereal lymphogranuloma was negative in the 50 patients tested. Roentgenograms of the chest were negative for active pulmonary tuberculosis; the inoculation of rectal discharges from a small group of patients into guinea pigs yielded negative results. The gross and histologic changes at autopsy in the 14 fatal cases were interpreted by the pathologist as characteristic of nonspecific ulcerative colitis.

ROENTGEN OBSERVATIONS

The colon and terminal part of the ileum were examined roentgenologically in 89 cases. The colon appeared normal in 24 patients, 19 of whom had experienced mild symptoms. The colon was totally involved at the initial examination in 30, and, at a later study, in 5 additional patients; the terminal part of the ileum was demonstrably diseased in 9 of the 35. The roentgen extent of the disease did not correspond uniformly with the duration of symptoms (table 3). Complete involvement was observed in 10 patients with an illness of less than one year's duration, whereas a normal colon was demonstrated in 2 persons more than ten years after the initial appearance of symptoms. In general, the clinical course parelleled the extent of involvement, being more severe with more extensive disease, but there were striking exceptions. The symptoms were extremely mild in 18 patients with roentgen evidence of the disease, including 4 with involvement of the entire colon, on the other hand, the clinical course was moderately severe in 2 patients whose colons appeared normal by roentgen rays.

TABLE 3 - *Initial Roentgen Findings and Duration of Symptoms*

	Duration of Symptoms			
Extent of Involvement	Less Than 1 Yr.	1-9 Yr.	10-20+ Yr.	Total
Normal	10	12	2	24
Rectosigmoid only	3	7	1	11
Rectum to splenic flexure	6	5	1	12
Rectum to hepatic flexure	2	6	-	8
Entire colon	10	16	4	30
Segmental	1	2	1	4
Total	32	48	9	89

Two or more roentgen examinations were obtained in 50 patients (table 4). The period of roentgen observation was slightly less than a year in 4 cases, between one and nine years in 37, and exceeded ten years in 10 patients. The roentgen findings were stationary in 31 patients, including 11 with a normal-appearing colon. Progression was observed in 13, 11 of whom gave roentgen evidence of disease at the initial examination. Improvement was noted in 6 patients, a normal appearance being regained in 3.

These observations coincide with those of Hern and with the results of a similar study made by us previously.[9] The evidence suggests that nonspecific ulcerative colitis in many cases attacks the colon with greatest intensity relatively early in the disease and that the initial roentgen examination not infrequently discloses the maximum extent of the disease.

Entire colon	12	3	1*
Segmental	—	—	1
Total	31	6	13

* Polyposis and carcinoma of descending colon.

RELAPSES

The clinical course was characterized by frequent exacerbations of symptoms. These varied in severity and duration and recurred at unpredictable intervals. The possible causes of 140 separate relapses, as listed in table 5, suggest that emotional stress, infections of the upper respiratory tract and physical fatigue were most often associated with the recurrence of symptoms. Twenty patients, though not recalling specific details, nevertheless emphasized nervous tension as an important disturbing influence. Nine exacerbations accompanied pregnancy; however, pregnancy was uneventful in 7 other patients. Three recurrences appeared to coincide with the extraction of teeth. The incision of a peridental abscess was followed by a fatal relapse in 1 case.

TABLE 5 --*Possible Precipitating Factors in 140 Relapses of Nonspecific Ulcerative Colitis*

Type	Relapses
Emotional stress	49
Infections of respiratory tract	40
Physical fatigue	20
Dietary indiscretions	11
Pregnancy	9
Dental extraction	3
Incision of peridental abscess	1
Barium enema	2
Operations (a) appendectomy	2
(b) tonsillectomy	1
Injury	2

Total	140

PSYCHOGENIC FACTORS

Present interest in the role of psychogenic factors in nonspecific ulcerative colitis derives largely from the observations of Murray, Sullivan, Daniels and Wittkower.[10] It seemed of interest to survey briefly the emotional background of 72 patients for whom such data were available. Eighteen patients were interviewed by psychiatrists and 16 by a physician investigating the psychosomatic aspects of ulcerative colitis. Significant emotional problems were detected in 32 of the 34. Among the remaining 38 cases, definite emotional disturbances were encountered in 15 and lesser degrees of nervous tension in 20. Possible psychogenic factors thus were present in 67 of 72 patients, 42 women and 25 men. The patients often were described by the psychiatrists as immature, dependent and overtly passive. Anxiety states, insecurity, hostility, sexual maladjustments and schizoid tendencies were commonly observed. There was a tendency for the symptoms to recur or to become accentuated during the development of situations requiring responsible and decisive action.

COMPLICATIONS

The complications of chronic nonspecific ulcerative colitis are numerous, varied and often extremely serious.[11] They may be classified arbitrarily as disturbances of nutrition, "local" complications arising in the bowel and "systemic" complications affecting areas of the body other than the colon.

Nutritional deficiencies[12] result from the inadequate intake and utilization of food, from the loss of nutrient substances, especially protein, via the bowel and, perhaps, also from the depression of metabolic functions, particularly those of the liver, by "toxins." The nutritional complications of major importance in this series may be summarized as follows:

Anemia: Moderate or severe, usually hypochromic, microcytic anemia developed in 60 patients. The erythrocyte count in 24 of these ranged from 1,900,000 to 2,900,000; the hemoglobin values were between 5 and 8 Gm.

Prothrombin Time: The prothrombin time was prolonged in 6 cases; readings 43 and 48 per cent of normal were obtained in 2 patients during the course of a fulminating illness.

Hypoproteinemia: The plasma proteins and albumin-globulin ratio were measured at variable intervals in 58 patients (table 6). Values below the minimum normal level of 6 Gm. per hundred cubic centimeters were obtained in 29 cases, in all of which the ulcerative colitis was severe. The albumin-globulin ratio was reversed in 9 patients, chiefly because of a reduction in the albumin fraction. Electrophoretic studies in a small group of cases have confirmed the presence of hypoalbuminemia.[13] The plasma proteins subsequently returned to normal levels (usually between 6.5 and 7 Gm. per hundred cubic centimeters) in 23 of the 29 patients. The plasma proteins ranged from 4.1 to 5.03 Gm. per hundred cubic centimeters in 5 of the 9 medical fatalities.

TABLE 7.—*Clinical Complications in Chronic Nonspecific Ulcerative Colitis**

Complications	Cases
Stricture	19
Perirectal abscess, fistula	17
Polyps	16
Severe bleeding from bowel	12
Perforation, colon; peritonitis	6
Severe hemorrhoids	4
Intestinal obstructions	1
Carcinoma of the colon	2
"Toxic" psychosis	2
Erythema nodosum	9
Pyoderma	4
Infections, eye and ear	5
Aphthous stomatitis	4
Nonspecific laryngitis—obstruction—tracheotomy	1
Parotitis	2
Arthritis	8
Peripheral neuritis	3
Thrombophlebitis	3
Vascular thromboses	2
Pneumonia	3
Infections, urinary tract	4
Renal calculi	3
Infantilism	1
Miscellaneous	14
No complications	33
One complication	28
Two complications	17
More than two complications	22

*Not including anemia, hypoproteinemia, complications after surgical treatment or those found at autopsy.

Peripheral neuritis and other evidences of vitamin deficiency were noted in the more seriously ill patients. The urinary excretion of thiamine was decidedly reduced in the 2 patients so examined. The level of ascorbic acid in the blood was diminished in the 3 persons tested. Cannon[14] has directed attention to the profound loss of resistance and the high incidence of infections in malnourished hypoproteinemic patients. It seems likely, therefore, that many of the infections observed in this series are attributable, in part at least, to impairment of nutrition. Eleven of the 14 patients who died were emaciated at the time of autopsy; severe fatty changes were found in the liver in all 14. The importance of fatty hepatic degeneration of this disease has been stressed by Cain and Callen.[15] Tumen and his associates[16] recently have described 5 instances of hepatic cirrhosis in patients with ulcerative colitis.

Stricture, polyps, perirectal abscess and fistula, profuse hemorrhage and perforation of the colon with peritonitis were the most frequent " local " complications (table 7). The more common " systemic " complications included cutaneous lesions, pyogenic infections, arthritis, pneumonia, peripheral neuritis, vascular thrombosis and thrombophlebitis. Multiple complications were present in 39 patients. The incidence of secondary disorders is higher in this selected series than in other reported studies, reflecting the severity of the disease in the group chosen for illustrative purposes.

RESULTS OF MEDICAL TREATMENT

Eighty-six of the 100 patients were hospitalized one or more times. The total period of hospitalization for individual cases ranged from one hundred to three hundred days in 37 cases and from four hundred and fifty-eight to six hundred and sixty-two days in 5 cases. Eighty-one patients were treated medically throughout the course of their illness. Therapy included bed rest and the use of sedatives and antispasmodics; emotional problems were evaluated and their solution sought. Emphasis, with respect to nutrition, was placed on the oral intake of a bland attractively served diet, containing 90 to 110 Gm. of protein and 2,500 to 3,500 calories. Vitamins were given routinely, frequently vitamin K. Other measures included transfusions of blood and plasma, the administration of 5 per cent dextrose in isotonic solution of sodium chloride and, occasionally, protein hydrolysates. The majority of patients received various types of sulfonamide compounds; pencillin was administered in a small number of cases. One patient manifested an excellent response to sulfaguanidine, even when given in small doses. In general, however, the results with chemotherapy were not striking. Definite clinical improvement in many cases appeared to coincide with the administration of sulfonamide compounds and/or pencillin, but the effectiveness of the antibiotics appeared to diminish with repeated courses of treatment. On the other hand, chemotherapy proved extremely valuable in the management of complicating infections and, for example, facilitated the recovery of 1 patient who had sustained a perforation of the colon with generalized peritonitis.

Nine patients died during medical treatment. Among the remaining 72 cases slight improvement only occurred in 19 persons, none of whom were significantly incapacitated. Improvement was moderate in 22 and pronounced in 25 patients. Six patients, observed for periods of six to fifteen years, maybe tentatively classified as "cured" or with indefinitely prolonged remission. There have been no symptoms during intervals of three to fourteen years, and results of proctoscopic and roentgen examinations are now normal.

RESULTS OF SURGICAL TREATMENT

Nineteen patients were treated surgically (table 8). Indications for operation were the persistence of severe symptoms during medical treatment, stricture with partial obstruction, diffuse polyposis, extensive perirectal ulceration and severe arthritis or anemia. Approximately 50 such complications occurred in the 19 patients operated on. In 8 of 11 such patients examined roentgenologically, the entire colon was diseased; in the remaining 3, varying degrees of involvement were noted.

One patient with segmental colitis improved decidedly after resection of the diseased segment. Ileostomy was performed in the other 18 patients, with 4 deaths. Of the remaining 14 patients, 3 improved markedly; however, subtotal colectomy became necessary in 1 of these a year later. Moderate improvement occurred in 7 patients, characterized by a gain in weight and by partial or complete resumption of their former occupations. However, complications, notably anemia and arthritis, persisted or recurred frequently. Two patients were unimproved and subsequently underwent resection of the colon. The disease progressed in 2 patients despite ileostomy five and ten weeks after the onset of symptoms; advanced ulcerative colitis of the entire colon was demonstrated in both cases four years later. Sanguinous or sanguinopurulent rectal discharges continued in varying degree in all 14 patients surviving ileostomy. After operation, partial intestinal obstruction occurred in 4, fecal fistula in 4 and abscess formation in 3.

TABLE 8.—*Results of Surgical Treatment (19 Patients)*

	Resection of Segment of Colon (1)	Ileostomy (18)	Further Surgery	
			Partial Colectomy (9)	Resection of Rectosigmoid (2)
" Completely well"			5	
Pronounced improvement	1	3	3	1
Moderate improvement		7		1+
Unimproved, stationary		2		
Unimproved, progressive		2*		
Deaths		4	1	

* Operation was done elsewhere five and ten weeks after initial onset of symptoms.

+ Subsequently there was closure of ileostomy opening; death occurred three months thereafter from perforation of colon and peritonitis.

Eleven of the 14 patients underwent further surgical treatment subsequent to the ileostomy. One patient improved decidedly after abdominoperineal resection of the rectum. Moderate improvement occurred in the second case after resection of the rectosigmoid because of stenosis; the ileostomy opening later was closed, but the patient died three months thereafter from perforation of the colon and peritonitis.

The colon from the cecum to the rectosigmoid was removed in 9 patients with 1 death. Partial proctectomy was necessary later in 1 case because of pronounced stenosis of the rectum. Eight patients are alive from one to ten years after operation. Five consider themselves "well" or "almost normal." Three patients are moderately improved and have regained their normal weight; the majority have been able to work. Their only difficulties at this time consist of the occasional passage of mucoid or bloody material from the rectum and the management of the ileostomy opening.

The relative merits of the medical and surgical treatment of nonspecific ulcerative colitis continue under active discussion.[17] The reported indications for surgical intervention range from that of ileostomy within several weeks after the onset of symptoms to ileostomy and resection of the colon only in patients with persistently severe symptoms during medical management or with severe complications. Our experience is in accord with the latter view. The present results indicate that, although considerable improvement may occur after ileostomy, this procedure does not cure the disease. Nor does ileostomy invariably retard the progress of the colitis, as is illustrated by 2 patients, even when performed soon after the appearance of symptoms. Resection of the colon in selected cases, on the other hand, usually induces a decided improvement, with restoration of the patient to a healthier and more active life.

CAUSES OF DEATH

There were 14 deaths in this series, 9 during medical treatment and 5 after operation; 8 of the patients were men and 6 women. Six of the 9 medical fatalities occurred before 1942 (table 9). The principal causes of death in the medical group were peritonitis in 6, due to perforation of the colon in 5 and of the ileum in 1; inanition and pneumonia in 2 and thrombosis of the left common iliac artery with gangrene of the left lower extremity in 1. The principal causes of death in the surgical group were peritonitis in 3, due to ulcerative enteritis and perforation of the small bowel, cerebral thrombosis in 1 and adenocarcinoma with intestinal obstruction in 1. The chief contributory causes of death in the entire group were malnutrition in 9, pneumonia in 6 and disturbances of the acid-base equilibrium in 3 patients having undergone ileostomy. In the latter group, the postoperative course was characterized by severe diarrhea, hypochloremia, dehydration and episodes of peripheral vascular collapse.

This study directs attention to a number of interesting clinical features of nonspecific ulcerative colitis.

First, with regard to age, while it is generally recognized that the disease occurs most frequently during the second, third and fourth decades, the fact that it may occur at any age has, perhaps, not been emphasized sufficiently. The youngest patient in this series, for example, was 2 years and 6 months at the time of onset; the eldest, 57 years. Secondly, the high mortality rate among young patients with severe symptoms is of considerable importance in evaluating the prognosis. Six of the 9 medical deaths recorded occurred in persons less than 25 years of age; 4 were under 20. The duration of symptoms was less than a year in 3 of the fatal cases, and between one and two years in 3 others. Of the 4 surgical fatalities, 4 patients were less than 29 years of age. The disease had been present for a longer time, however, in the surgical group, as evidenced by the fact that symptoms had existed for periods ranging from twenty-one months to fifteen years.

TABLE 9.—*Causes of Death in Fourteen Patients with Nonspecific Ulcerative Colitis*

Principal Causes	Medical (9)	Surgical (5)
Peritonitis		
(a) Perforation of colon	5

Pneumonia	4	2
Vascular thromboses		
Both femoral veins	1	
Left common iliac vein	1	
Acute cardiac dilatation	1	
Necrosis of liver and spleen		1
Diarrhea, hypochloremia--peripheral vascular collapse		3

The frequency of inflammatory changes in the rectum, as shown by proctoscopy, is significant from the standpoint of the pathogenesis of the disease. In this series, proctoscopic evidence of nonspecific ulcerative colitis was present in 95 per cent of cases. This observation and the roentgen demonstration of disease of the rectosigmoid in 61 of 89 patients examined support the concept that nonspecific ulcerative colitis begins in the rectum. Judging from the evidence provided by statistics giving the incidence of involvement in varying portions of the colon, the disease does progress retrograde from the anus to the ileocecal valve and, indeed, to the terminal ileum. It is to be noted, however, that while extension of the process was demonstrated roentgenologically in 25 per cent of the cases, the disease appeared by roentgen rays to be stationary in 62 per cent. The subsidence of the inflammation occurring during the remissions of the disease was much more evident proctoscopically than it was roentgenologically. The chronicity of the process is further indicated by the fact that definite roentgenologic evidence of regression was observed in only 6 of the 50 patients reexamined after a significant period (one to fifteen years).

[17] Cattell, R.B.: Colectomy for Intractable Ulcerative Colitis, S. Clin. North America 17:803, 1937. Jones, T.E.: The Surgical Treatment of Ulcerative Colitis, J.A.M.A. 111:2076 (Dec. 3) 1938. Elsom, K.A., and Ferguson, L.K.: An Appraisal of the Medical Versus the Surgical Treatment of Idiopathic Ulcerative Colitis, Am. J. M. Sc. 202:59, 1941. Bargen, J.A.; Lindahl, W.W.; Ashburn, F.S., and Pemberton, J.J.: Ileostomy for Chronic Ulcerative Colitis: End Results and Complications in Eighty-Five Cases, Ann. Int. Med. 18:43, 1943. Footnote 3.

While the clinical severity of ulcerative colitis usually parallels the degree of involvement of the colon, this correlation is by no means exact. There is likewise no uniform relationship between the roentgen extent of the disease and the length of symptoms. In 10 patients with symptoms of less than a year's duration, including 2 with an illness of only four weeks, the entire colon was diseased.

Although the cause of nonspecific ulcerative colitis remains obscure, the symptoms and clinical course strongly suggest that the disease is an inflammatory process. However, no specific organism has been established conclusively as the etiologic agent. Possibly a number of factors are involved. The role of emotional stress is not clear at present. There is no convincing evidence that the disease is psychogenic in origin. Nevertheless, it would appear from the frequent coincidence of emotional disturbances and the recurrences of symptoms that some relationship does exist between psychogenic factors and the exacerbations of the disease.

The tendency toward exacerbations and remissions of symptoms is one of the characteristic features of nonspecific ulcerative colitis. It is possible to attribute the relapses in this series to emotional disturbances in 34 per cent; to infections of the respiratory tract in 29 per cent and to physical fatigue in 14 per cent. However, these represent several of the more common difficulties in life, and, hence, the relationship may be more accidental than causal. Indeed, relapses seem to occur with any form of stress and to be a reflection of a labile intestinal response.

In spite of the emphasis on the severity of the disease, it is an interesting fact that ulcerative colitis may exist for many years without significant disability and with rather minor symptoms. This is illustrated particularly in 5 patients in whom mild symptoms recurred over periods of seventeen to twenty-one years, with surprisingly little impairment of health.

The high incidence of complications in this selected series of patients is striking. Among these, nutritional deficiencies and such local complications as perforation, stricture, polyps, perirectal abscess and neoplastic hyperplasia are of particular importance. Thus, perforation of the bowel and peritonitis, malnutrition and vascular thromboses accounted for the majority of deaths. The therapeutic implications are obvious, but it remains to be seen how satisfactorily these complications can be prevented by modern methods of maintaining nutrition and by chemotherapy.

It is apparent from this study that the number of "cures" is small. In the 100 cases there are only 6 which we were willing so to designate. By "cure" we mean a normal bowel function, a normal colon as determined by roentgen rays and a normal rectal mucosa by proctoscopy. The number of cures was exceeded by the number of deaths, there being a total of 14 fatalities, 9 on medical management and 5 in patients subjected to operation. Of the remaining 80 patients neither cured nor dead, 47 have manifested a definite improvement and 19 a slight improvement on medical management. The occasional exacerbations of the disease usually respond to the program of rest, a bland diet, high in protein content, sedatives, antispasmodics, vitamins, psychotherapy and chemotherapy. Surgical intervention is indicated, in our judgment, chiefly *for patients with severe symptoms persisting* during medical treatment or with severe complications. Operation seems to have saved 14 persons from a life of invalidism and restored them to health; however, it has not cured the disease, except perhaps for the 8 patients surviving resection of the colon.

SUMMARY

This study again emphasizes the fact that nonspecific ulcerative colitis is a chronic disease, the course of which is characterized by frequent exacerbations and remissions. In spite of evidence of a retrograde spread of the process from the anus to the terminal part of the ileum in certain patients, we have been surprised to see how often the initial involvement seems to be the maximum involvement, as determined roentgenologically. Proctoscopic evidence of improvement during remissions is usually obtained; roentgenologic proof of regression is rare, occurring in only 12 per cent of the patients studied. The mortality rate is highest in young patients with severe symptoms during the initial one or two years of illness. The predominant precipitating factors seem to to be emotional stress, acute infections of the respiratory tract and physical fatigue. The most important complications are nutritional (cachexia, anemia, fatty degeneration of the liver) and local (perforation, abscess, fistulas, stricture, neoplastic hyperplasia). Complete and lasting cure following medical management is rare (6 per cent in this series); following ileostomy no cures of the disease process have been observed. On the other hand, after medical management alone, it has been possible to maintain 47 per cent of the patients in a "satisfactory" state of health; 19 per cent, though not markedly improved, are, on the other hand, not significantly incapacitated. Surgical treatment restored 14 of 19 patients to satisfactory health; 5 died. Under medical management, there were 9 deaths (11 per cent of those treated medically). Six of the 9 medical deaths occurred before 1942. The effect of more modern methods of therapy (nutritional, antibiotic, psychiatric) on the course of the *disease remains to be ascertained.*

SURGICAL TREATMENT OF ULCERATIVE COLITIS

RICHARD B. CATTELL, M. D.,
and
ERNEST SACHS JR., M. D.,
Boston

The treatment of ulcerative colitis in both the acute and chronic phases of the disease is rather difficult. There is uniform agreement that these patients should be treated medically as long as they show improvement and continue in a satisfactory condition. It should be admitted, however, that some patients do not respond satisfactorily to any or all of the medical measures that may be employed. It is in this group that surgical treatment has been demonstrated to be effective. There is considerable disagreement relative to the number that should be submitted to surgical treatment. This number will vary considerably in different series of cases depending on the number of cases of acute fulminating disease as well as the number with pronounced late cicatricial changes. The longer that a group of patients is followed the more complications will be encountered in which operation must be considered. Without doubt, a group of patients continuing under the care of a gastroenterologist or internist with few surgical consultations will have few operations performed. On the other hand, if they are followed on a surgical service a larger number may be operated on. Unquestionably, there is a middle ground between these two extremes where a surgical procedure can be employed to great advantage.

Over a period of twenty years at the Lahey Clinic these patients have been treated on the gastroenterologic service with frequent surgical consultations in those cases in which medical management is unsatisfactory. We wish to present our surgical experience of this twenty year period—during which time an appreciable number of patients has been operated on—in an attempt to evaluate the place of surgical treatment in the management of ulcerative colitis.

It must be admitted that the results of the first half of this period, 1927 to 1936 inclusive, were found to be unsatisfactory because of a high operative mortality and complications related to the operative procedures. Furthermore, during this period the care of patients with ileostomy was less satisfactory than it became subsequently. The high operative mortality was largely owing to delay in submitting patients to surgical treatment. With an increasing experience in selection of patients for operation and with knowledge gained in the technical aspects of operation, both complications and mortality have been decidedly lowered. Furthermore, with a better management of ileostomy, these patients are no longer handicapped to the extent that they were previously. It is hoped that the presentation of this experience together with that of others may aid in clarifying the status of surgical treatment in the management of ulcerative colitis.

During the twenty year period 1927 to 1946 inclusive, 630 patients with ulcerative colitis were under medical treatment. From this group, 166 patients, or 26 per cent, were operated on. During the first five years of this period ileostomy, colostomy and occasionally partial colectomy were employed, and these infrequently. Because this early experience was most unsatisfactory, we worked out a plan for surgical management which was predicated on earlier intervention and confined to three procedures: ileostomy, subtotal or partial colectomy and total colectomy. Temporizing operations such as appendicostomy and colostomy were discontinued and were not further utilized.

To illustrate more graphically the employment of surgical procedures in our cases of ulcerative colitis, we found that of every 4 patients, 2 would respond satisfactorily to medical measures even though they might have a mild return of symptoms during a long period of observation. A third would have recurrent symptoms to an extent that the result might be considered unsatisfactory, but under intermittent medical treatment the symptoms were managed reasonably well. The fourth patient, because of one or more complications, was submitted to operation. Kiefer,[1] in reporting 55 cases that were followed after medical treatment, stated that in 45 per cent the results were unsatisfactory because of recurrence of symptoms.

INDICATIONS FOR SURGERY

The number of patients who have been submitted to operation in the series reported in the literature has varied greatly. Bargen[2] and his associates reported that of 3,301 patients who were under treatment 5.5 per cent were submitted to operation. Cave[3] reported an incidence of 20 per cent and Garlock[4] stated that 10 to 20 per cent of patients required operation. As stated earlier in this paper, we have operated on 26 per cent of our patients.

Indications for surgical treatment in ulcerative colitis are rather similar to those for surgical intervention in peptic ulcer. These have previously been presented by one of us[5] and will be briefly discussed in this paper.

Failure of Medical Management.—Unsatisfactory results with medical treatment may occur in both the acute and chronic forms of the disease. The acute fulminating type is the most difficult to treat and it is in this group that the highest medical and surgical mortality occurs. Approximately two thirds of the fatalities following operation in our series occurred in this group. Death from the toxemia of the infection or perforation of the bowel may occur a short time after onset. If operation is delayed in this group, a prohibitive mortality will result. If these patients do not respond satisfactorily to medical treatment within a few days to a week ileostomy should be advised. If perforation and peritonitis have occurred, neither medical nor surgical treatment will be of aid. The only hope for saving these patients is to carry out an ileostomy as early as possible. If this policy is adopted it will result in a higher percentage of patients being submitted to operation but will unquestionably lower both medical and surgical mortality.

In the chronic type the indications for surgical intervention are less well defined. Whatever time is necessary to evaluate the condition of the patient and the function of the colon can be taken. If the disease causes chronic disability so that the patient is unable to pursue normal activity or gainful occupation, surgical treatment is certainly indicated. In order to clarify our position relative to these cases we would state that any patient who is incapacitated for three months or more out of each year should be operated on. If it is difficult to maintain a satisfactory nutritional state or if there is persisting diarrhea or incontinence of the anal sphincter, the patient's condition can be greatly improved by operation.

Subacute Perforation, Abscess and Fistula.—As stated previously, if there is free perforation into the peritoneal cavity, surgical treatment rarely offers benefit. At times, while patients are under medical treatment signs and symptoms of peritoneal irritation may develop, suggesting impending perforation. If these do not disappear promptly, operation should be advised. Rather frequently, signs will be encountered of previous local perforation as evidenced by localized abscess within the abdominal cavity or more usually in the pelvis or perirectal area. Less frequently we have encountered abdominal fistula, rectovesical fistula or rectovaginal fistula. In 1 patient all three of these were found and, in addition, a duodenocolic and an ileosigmoidal fistula were present. Operative treatment offered the only means of relieving these patients.

Obstruction.—One of the late complications in long-standing ulcerative colitis is contraction of the colon or rectum to a point where obstruction occurs. This may be found when active infection is no longer present. As long as the stools remain liquid a severe degree of obstruction does not occur. Most of the patients with a foreshortened, so-called lead pipe colon may no longer be treated satisfactorily on a medical regimen. We have seen a number of patients in whom rectal examination was impossible because of narrowing and obstruction of this portion of the bowel. In this group the surgical indications seem to be clear.

Hemorrhage.—Fortunately, massive hemorrhage in patients with ulcerative colitis does not occur frequently. A high mortality is likely to result in these cases just as it does in those of the acute fulminating type. If hemorrhage continues in spite of repeated blood transfusion, operation should be advised, but it should be limited to ileostomy, since the results of resection during acute hemorrhage are followed by a prohibitive mortality. Chronic blood loss is seen more frequently, and if medical measures fail to correct the anemia, operation is indicated.

Infectious Arthritis.—Infectious arthritis involving one or more joints is a common complication in ulcerative colitis. We have seen it lead to pronounced structural changes in the joints resulting in complete incapacity from muscle atrophy and flexion contraction. If removal of the colon is carried out before structural change occurs in the joints, dramatic recovery will usually follow. Once this process becomes established only surgical treatment will be effective for its relief.

Polyposis.—When ulcerative colitis has been present for a considerable period, pseudopolypoid degeneration of the mucosa may occur. This can readily be visualized by the sigmoidoscope and by contrast air films of the colon. It may be found in patients in whom hemorrhage is a conspicuous feature as well as in the markedly contracted colon. These patients, in our experience, respond poorly to medical management and should have surgical intervention.

Carcinoma.—We have had 12 patients in whom carcinoma has developed from ulcerative colitis. Early in our experience we were not impressed with this as a frequent complication. Recently these cases were reviewed,[6] and it was found that the average duration of the ulcerative colitis in cases in which malignant degeneration developed was nine years. From this experience we believe that the longer patients are followed the higher the incidence of malignant degeneration will be. Seven per cent of the patients operated on in our series had carcinoma. Any patient with a filling defect or irregularity in the colon as shown by barium enema should be operated on. Furthermore, in any patient who has been in a quiescent state but who begins to pass blood, the development of malignant degeneration should be strongly suspected. Unless earlier operation is advised in this group of patients the results will be poor. Only 3 of the 12 patients operated on are living two years or more after operation.

Segmental Colitis.—In a small percentage of cases ulcerative colitis is limited to one part of the colon or to the rectum. If the proximal bowel is involved segmental resection

---

[6] Cattell, R. B., and Boehme, E. J.: The Importance of Malignant Degeneration as a Complication of Chronic Ulcerative Colitis, Gastroenterology, to be published.

h anastomosis may be done. In those cases in which only the distal segment is involved abdominoperineal resection with colostomy may be carried out. These patients must be carefully selected to be certain that both the preoperative and operative findings demonstrate that the process is limited. Our poorest results of surgical treatment have occurred in this group because of the presence of the disease beyond the limits of the resection.

The largest number of our patients were submitted to surgical treatment because of unsatisfactory response to medical treatment. Abscesses, subacute perforations and fistulas were the indications for operation in 10 cases. Thirteen patients had pseudopolyposis, 12 had cancer, 7 had severe infectious arthritis and 5 had a severe degree of obstruction. Fecal incontinence was present in 9 cases.

TYPE OF OPERATION

Three surgical procedures are being employed at the Lahey Clinic in the surgical treatment of ulcerative colitis. These are ileostomy, partial or subtotal colectomy and total colectomy. Except in the segmental form of the disease, ileostomy is the first surgical procedure instituted. Cases in which ileostomy has been performed should be followed for a considerable period before a decision is made as to the necessity for removal of the colon. If observation is continued for at least six months, maximum improvement should be evident, and during this period visualization of the bowel by sigmoidoscopic and barium enema examinations will be possible. Furthermore, this period enables the patient to improve and to be a much better operative risk for whatever further surgical treatment is required.

There are three possibilities for the patient who has had ileostomy. First, the ileostomy may be closed in a few cases; second, the ileostomy may be permanent with a remission of symptoms continued, and third, the ileostomy is permanent but symptoms persist and colectomy must be done for relief.

Closure of an ileostomy is not often possible. In our series of 145 patients with ileostomy, closure was carried out fourteen times, or in 10 per cent of the cases. It was necessary to do a second ileostomy in 6 because of recurrence of the disease, while 8 patients have continued to do well for six months to eight years following closure. The number of patients in whom closure of the ileostomy will work out satisfactorily can increase only if ileostomy is performed before pronounced structural change occurs in the colon. Closure should not be considered unless conditions are rather favorable, as previously outlined by one of us.[7] Complete remission of symptoms for a year or more after ileostomy, negative sigmoidoscopic findings and an adequate lumen as demonstrated by the barium enema must all be present.

We see no indication for colectomy for the patient who has a remission of symptoms by ileostomy, yet cannot have the ileostomy closed. Unfortunately, in our experience this group is small, as we have only 15 patients whose course we are following with ileostomy alone without removal of a portion or all of the colon. The indications for removal of the colon will increase the longer that this group is followed.

The second surgical procedure which we utilize is partial or subtotal colectomy. All patients are included in this group in whom a portion of the colon is removed, but some segment is left, either proximal colon or rectum.

TABLE 1. *Type of Operation*

	Patients	Operations
Ileostomy	145	151*
Partial colectomy	46	78
Total colectomy	75	235

*Six had a second ileostomy.

We include in this group the patients in whom the right, transverse and descending colon have been removed.

The third surgical procedure we term total colectomy. In all of these patients, the terminal ileum, right, transverse and descending colon and rectal segment are removed. This procedure is usually carried out in three stages, consisting of ileostomy, colectomy and abdominoperineal resection.

CLINICAL DATA

The type of operation which we have employed is shown in table 1. Of the 166 patients who have been operated on, 145 have had ileostomy; a total of 151 ileostomies were performed, since 6 patients had a second ileostomy. Partial colectomy, usually in two stages, was carried out in 46 cases, with a total of 78 operations. These procedures were made up of a number of different operations. In a few, hemicolectomy and abdominoperineal resection were done, leaving a permanent colostomy in the transverse colon. A few had ileostomy with removal of the colon but with the rectal segment left. The largest number of this group had removal of the colon, with a Mikulicz form of anastomosis between the ileum and sigmoid colon, or ileostomy and colectomy followed later by implantation of the ileum in the sigmoid. No resections and primary anastomoses were done in this group. Removal of the colon and rectum, which we term total colectomy, was performed in 75 patients, 235 operations being required to carry it out.

The operative mortality is shown in table 2 and is rather high. One hundred and sixty-six patients had a total of 313 operations. There were 37 operative deaths, making a patient mortality of 22.3 per cent and an operative mortality of 11.8 per cent. Twenty patients died after their discharge from the hospital, which figure includes 3 known suicides. It is believed that most of these subsequent deaths were related to the disease of ulcerative colitis or to late complications following operation. This leaves 109 patients of the total group of 166 operated on who have survived for six months to twenty years following surgical treatment. It should be appreciated that patients submitted to operation are those with the disease in the most severe form and associated with serious complications. They represent the patients who cannot be controlled medically.

---

[7] Cattell, R.B.: Closure of Ileostomy in Ulcerative Colitis, Ann. Surg. 115:956-968 (June) 1942.

The reasons for the high operative mortality are indicated in table 3. There were 27 deaths following ileostomy, an operative mortality of 18 per cent. Twenty-two of these 27 deaths occurred in patients in whom the ileostomy was done as an emergency. Many of these occurred early in our experience when we were slow to accept ileostomy, and most of the deaths occurred in the acute fulminating type. Seven deaths, or 15.2 per cent, followed partial or subtotal colectomy. From our experience we believe that too many patients were submitted to subtotal colectomy who should have had total colectomy in two or, usually, three stages. Few of these patients had an initial ileostomy, which would have made the procedure much safer, since these cases were not emergencies. Only 3 deaths, or 4 per cent, occurred in patients who had total colectomy. This is not a true figure, since some of the patients who had partial colectomy only were candidates for total colectomy and a considerable proportion of the mortality associated with ileostomy should properly be considered as part of the mortality of total colectomy. It is difficult to arrive at the correct figure for the risk of total colectomy because the procedure is not decided on at the time that ileostomy is done but only after subsequent observation of six to twelve months. It does demonstrate, however, that patients withstand abdominoperineal resection well because they have already had the improvement gained by ileostomy and the first stage of the colectomy.

TABLE 2. - *Mortality*

Total patients	166	Patient mortality	22.3%
Total operations	313	Operative mortality	11.8%
Operative deaths	37		
Subsequent deaths (including 3 suicides)	20		
Surviving 6 months to 20 years	109		

TABLE 3. - *Mortality Correlated with Type of Operation*

		Operative Deaths		Subsequent
	Number	Cases	Percentage	Deaths
Ileostomy	145	27	18	4
Partial colectomy	46	7	15.2	10
Total colectomy	75	3	4	6*

*Including 3 suicides.

The most significant thing relative to deaths that may follow the patient's discharge from the hospital is also illustrated in table 3. It will be noted that there were 10 subsequent deaths in patients having partial colectomy. In other words, of the 46 patients operated on 7 died after operation and 10 died after hospital discharge. Careful scrutiny of patients whose course has been followed after partial colectomy indicates that the segmental form of the disease is not common, since the process continued in spite of resection of all the bowel that appeared to be involved. Three patients who survived total colectomy died from surgical complications after leaving the hospital, and 3 additional patients were known to have committed suicide.

COMMENT

From our experience we believe that when surgical intervention is necessary in ulcerative colitis, ileostomy will be required and in most cases must be followed by removal of the colon. Bargen[2] and his associates reported 185 patients who had ileostomy performed over a twenty-seven year period, with 55 deaths. Of the 130 patients surviving operation, 39.2 per cent had further symptoms. These results are similar to those reported by Cave,[8] who performed 196 operations on 106 patients with a patient mortality of 19.8 per and an operative mortality of 10.7 per cent. In a group of 15 patients who had ileostomies which he considered as emergencies, there were 8 deaths, or 53.3 per cent, in contrast to the mortality of 9.4 per cent following elective ileostomies. He performed 58 subtotal colectomies with 6 deaths, and in 11 of these patients abdominoperineal resection was done without further fatality. Garlock[9] reported 25 patients who had been submitted to operation before 1941 and 68 additional cases in 1945. Following 21 subtotal colectomies there were 4 deaths—19.9 per cent, and after 38 ileostomies, 6 deaths, or 15.7 per cent. Dennis[10] reported 25 surgical cases with a mortality of 8 per cent for the different procedures employed.

A consideration of the mortality figures is important but does not give the real picture of what can be accomplished by surgical treatment. If one considers patients who have been submitted to total colectomy with permanent ileostomy in whom it is known that all of the infected bowel has been removed, we find a high proportion in excellent health. Their nutritional state is entirely normal. With the modern management of ileostomy by means of an apparatus that is cemented to the skin of the abdominal wall,[11] a minimum of inconvenience from the ileostomy is experienced.[12] These patients are able to pursue essentially normal activity which includes sports and all types of work. They are an exceedingly grateful group of patients, since most of them had had a chronic illness of long duration. Several patients have been married after surgical treatment, and an occasional one has gone through a successful pregnancy.

[12] Cattell, R.B.: Care of Ileostomy, Lahey Clin. Bull. 4:45-52 (Oct.) 1944.

Fortunately, with further experience with the surgical treatment and with earlier operation, mortality has been lowered markedly. This is well illustrated by the more recent experience during 1945 and 1946 (tables 4 and 5). During this period 75 patients were operated on, having a total of 94 operations. Some of these patients had been operated on before 1945 and some were operated on in 1947 or will have further procedures in the future. There were 3 deaths, a patient mortality of 4 per cent or an operative mortality of 3.2 per cent. During this period 39 ileostomies were done with 2 deaths and 30 partial colectomies with 1 death. Twenty-one total colectomies were completed without a fatality. During this period 3 ileostomies were closed. For this two year period the patient mortality of 4 per cent should be considered along with the mortality over a twenty year period of 22.3 per cent. We believe in the light of present knowledge and experience that this low operative mortality can be maintained. This low mortality, combined with the modern management of ileostomy, justifies the surgical treatment of all patients with ulcerative colitis who do not respond satisfactorily to medical treatment.

SUMMARY

Experiences in the surgical management of ulcerative colitis over a twenty-year period have been reviewed. The indications for surgical treatment are discussed. Operation is necessary to handle the complications occurring in the course of the disease.

One hundred sixty-six patients were operated on, representing 26 per cent of the total number of patients treated. Ileostomy, partial colectomy and total colectomy have been the procedures utilized. One hundred and forty-five patients have been submitted to ileostomy and 75 to total colectomy. There were 37 operative deaths, with a patient mortality of 22.3 per cent and an operative mortality of 11.8 per cent. Two thirds of the fatalities occurred in patients who had an emergency ileostomy.

During 1945 and 1946, 75 patients were operated on with 3 deaths, a mortality of 4 per cent.

ABSTRACT OF DISCUSSION

On papers of Drs. Kirsner, Palmer, Maimon and Ricketts and Drs. Cattell and Sachs

DR. J.A. BARGEN, Rochester, Minn.: My associates and I think of chronic ulcerative colitis as a syndrome comprising many or at least several disease entities. Our experiences with a rather large series of patients are in line with the results of Dr. Kirsner's follow-up studies. One should call attention, however, to the importance of some contributory factors which in a larger series seem to be of paramount importance. In the most common form of ulcerative colitis which we have been designating as thromboulcerative, or streptococcic, infections of the upper respiratory tract are of the first importance not only in initiating the disease but in subsequent exacerbations. In the milder form or insidious forms psychosomatic factors may assume importance. Reducing intestinal activity by withholding food and fluid by mouth and feeding the patient parenterally have great value in the extremely sick patient, the one whom we speak of as having the fulminating form of the disease, and this form of treatment has saved many patients from ileostomy. We have been using this form of treatment for many years but have always hesitated to continue it more than a week at a time. We can no more treat the fulminating form like the chronic form than we can treat simple, uncomplicated ulcer like the one with massive hemorrhage. When a case of severely acute colitis has become chronic, a different problem presents itself. Then it approaches the stage of so-called intractability. I have frequently said that intractability is directly proportional to the physician's patience and long-suffering. Intractability is rarely, if ever, an indication for surgical treatment. In the past, we have reported the incidence of surgical intervention as 5.5 per cent of our cases. There was a time when we operated on patients with the fulminating form and those who apparently had the intractable form. The mortality in the first group seemed to us to make surgical intervention prohibitive. Furthermore, in most of them the symptoms come under control by adequate medical care. In the group in which complications occur, surgical treatment frequently becomes mandatory. Dr. Cattell has listed these complications. The diffuse form or the thromboulcerative form of colitis should not be confused with the segmental type when surgical intervention is discussed. It is doubtful that more than 10 per cent of patients with various forms of ulcerative colitis should become surgical problems. However, each one of us must be prepared to keep the patient with chronic ulcerative colitis under observation for a long time once he consults us for advice and treatment. The careful follow-up of these cases over a long time cannot be overemphasized. If this is done good results will be achieved in most cases.

DR. E.N. COLLINS, Cleveland: Ten years ago we started using sulfonamide compounds as an adjunct to the usual therapy at Cleveland Clinic. During this time we have found administration of sulfonamide drugs by retention enema more effective than oral use, particularly in early cases in which the disease is limited to the rectum and/or the left colon. In the November 1946 issue of *Gastroenterology* we reported on 55 cases in which progress stool, proctoscopic and roentgen examinations had been made over a period of two years. Although it is impossible to attribute favorable results to any single item of therapy in this disease, the use of succinylsulfathiazole was considered beneficial. Only 10 patients failed to make a favorable response. In patients whose disease was limited to the rectum and/or the left colon (28 patients) only 1 had not improved, 3 had relapses which were promptly controlled when the use of succinylsulfathiazole was resumed, and 24 had complete remission from the time that the drug was first started by retention enema. Regular remittent courses of therapy were given over an average period of eight months, whether symptoms were relieved promptly or not. Our position on surgical therapy at present apparently corresponds with our geographic position, not quite as conservative as that held in Rochester, Minn., and perhaps more conservative than that held in Boston. However, the trend at the Cleveland Clinic is toward surgical intervention in a larger percentage of patients than was the case five years ago, particularly in patients having toxic symptoms.

DR. JOSEPH FELSEN, New York: Nothing has been said concerning the prevention of this disease. Since 1933 there has been a growing conviction that some, but not all cases of chronic ulcerative colitis are due to bacillary dysentery. What is the etiology of the remaining cases? No one has presented acceptable evidence pointing to any cause other than bacillary dysentery. The disease has been repeatedly traced in the same person from the initial acute specific phase of bacillary dysentery to the chronic, nonspecific phase of ulcerative colitis. The pathology is distinctive. The Shigella organism has been isolated with a frequency which is statistically significant in terms of adequate controls. The disputatious attitude of some clinicians concerning the relationship of the bacillary dysentery to chronic ulcerative colitis and chronic dysentery resembles that concerning puerperal fever. Holmes, in his treatise on "The Contagiousness of Puerperal Fever," stated: "If anyone is disposed, then, to take one hundred instances of lives endangered or sacrificed out of those I have mentioned and make it reasonably clear that within a similar time and compass ten thousand escaped the same exposure, I shall thank him for his industry, but I must be permitted to hold my own practical conclusions, and beg him to adopt and at least to examine them also. Children that walk in calico before open fires are not always burned to death. The instances to the contrary may be worth recording, but by no means if they are to be used as arguments against woolen frocks and high fenders." In only a small percentage of patients with acute bacillary dysentery does chronic ulcerative colitis or ileitis develop. Of these, the Shigella organism can be recovered in only 10 to 15 per cent after the lapse of one year. Our public health record in bacillary dysentery is deplorable, and the disease continues unabated. It is my conviction, after much critical study, that if we can eradicate acute bacillary dysentery, a completely preventable disease, we shall no longer see chronic ulcerative colitis or chronic ileitis.

DR. SIDNEY A. PORTIS, Chicago: I think that we should have a more philosophical approach to this problem. If a psychiatrist can produce a remission in this disease then it might be well to inquire what was happening to the body as a whole as a result of that form of therapy. Apparently, the bowel is put at physiologic rest. If the psychiatrist can presumably normalize the emotional status of a patient and therefore prevent overt stimulation through the parasympathetic nervous system, we ought to be able to simulate this treatment pharmacologically. Therefore, one should use atropine three times a day at meals and at bedtime to paralyze the parasympathetic nerves going to the gastrointestinal tract, particularly the sacropelvic nerves. This normalization of the emotional status may be further aided by the use of phenobarbital three times a day and an additional dose at bedtime. If enzyme digestion is a factor in continuing the ulceration of the mucous membrane then the binding or attenuating of those enzymes by wetting agents, such as sodium, alkyl sulfate, or any other detergent should be of distinct benefit. This may be given in enteric-coated capsules three times a day in doses of 200 mg. It is important that the patient be fed frequently during the day and before he retires at night. A high level of blood sugar coming from the gastrointestinal tract produces a more normal physiologic balance in the brain. In the care of a patient with this disease it is important that psychiatry be combined with medical treatment because a psychiatrist cannot control the emotional factors of a given patient twenty-four hours a day. The medical management outlined will prevent untoward complications and will provide the psychiatrist with the safeguards he should have in his approach and handling of a patient with this disease.

DR. ALBERT F. R. ANDRESEN, Brooklyn: In any case of bloody diarrhea it is of great importance to determine the cause of the diarrhea and the exact origin of the bleeding. Tuberculosis must be excluded and cancer must be suspected until it has been definitely ruled out. In a series of cases of so-called nonspecific ulcerative colitis we were able to prove that over 60 per cent were due to allergy, our figures agreeing almost exactly with those reported by Mackie. About 50 per cent of those caused by allergy have been shown to be due to milk. The success of many of the diets suggested for this disease depends probably on their small or absent milk content. Some of the worst cases I have seen have been due to orange, wheat or egg. It requires extreme care and patience to discover these allergens and to treat these patients, but even the cases of most severe colitis can be definitely cleared up by avoidance of the foods which have been shown to be the cause. In addition to this there must be adequate attention to dietetic needs, especially sufficient proteins, to the care of anemia, by repeated transfusions, and to general hygienic measures Secondary infections may require sulfonamide drugs or antibiotics. Operation is practically never necessary in the cases of acute disease but may be required for secondary obstructions or deformities. As in any other type of allergy, we cannot say that we cure our patients, because if they take the food they are allergic to or any to which they may later become allergic, exacerbations will occur. Sometimes these exacerbations are seasonal, not only because the food happens to be plentiful at the particular time of the year, but because at times a milk-sensitive person is really sensitive to something in the diet of the cow, which varies somewhat with the seasons.

DR. HYMAN I. GOLDSTEIN, Camden, N. J.: In discussing Dr. Portis' remarks on psychosomatic influence in these gastrointentinal disorders—may I recall some early references to this problem: D. Veegens' "De sympathia inter ventriculum et caput, praecipue in statu praeternaturali," Leyden Edinburgh, 1784; C. Wightman's "De consensu ventriculum inter et cerebrum," 1808; "A Lecture on the Connection and Reciprocal Influence Between the Brain and the Stomach," by Usher Parsons, Providence, 1841. I suggest that we read the symposium on the same topic—the influence of psychic factors on gastrointestinal disorders, including colitis, in the *Psychoanalytic Quarterly* (3:501-539, 1934). The late Dr. Jacob Kaufmann in 1918 addressed the American Gastroenterological Association on "The Psychic Element as an Important Factor in the Development and Treatment of Peptic Ulcer" (*Tr. Am. Gastroenter. A.* 1918, pp. 19-23). Hemmeter and Kaufmann knew of the importance of these psychic factors, and discussed them with me many years ago So we are today reviving the so-called new look--psychosomatic medicine, in relation to gastrointestinal disorders! Even Thomas Sydenham (1624-1689) considered colitis ("dysentery") a constitutional disease with (secondary) colonic manifestations. ("variolas anomalas constitutionis dysentericae").

DR. GARNET W. AULT, Washington, D.C.: Our experience with 110 patients having chronic ulcerative colitis indicates that 15 to 20 per cent become candidates for surgical treatment. Among 20 patients who underwent 35 operations, a postoperative mortality of 8.5 per cent was encountered. A mortality of 5.7 per cent, due to the disease but not the operative procedures, was likewise met. I should like to emphasize what Dr. Cattell said, that in a certain percentage of cases of chronic ulcerative colitis surgical intervention is indicated, under the circumstances that he outlined. A properly fitted ileostomy bag can be worn in the summer under a flat front dress. It does not leak. It is glued to the skin with liquid latex. The older apparatuses, sponges, dressings, etc., are not acceptable to the patient and should not be to the surgeon. The use of this bag after surgical treatment has enabled us to rehabilitate about 72 per cent of these patients for previous occupation or avocation. Most are employed on a full time basis without disability. They are not surgical invalids and they are not medical derelicts because they underwent operation.

DR. FRANK H. LAHEY, Boston: A majority of our patients are handled medically. One of the reasons that our incidence of surgical treatment is high is that many of our patients have intractable disease and are sent with the prospect of requiring surgical treatment. On the other hand, we see a large group of patients who come at a time when the patient, physician, gastroenterologist, surgeon and family are willing to accept the undesirable ileostomy, and that was the state of affairs when our first 80 ileostomies gave us a mortality of 22 per cent. On several occasions I made a plea for earlier ileostomy in these cases of acute disease. The reason that we did ileostomies late was that every one agreed that life with an ileostomy was an almost impossible existence. Now that we are able to close ileostomy openings and restore the fecal stream in some cases and have the Koenig-Rutzen bag which makes patients comfortable after ileostomies and is satisfactory, there is no argument against doing them early in serious cases. We now have a mortality in the later series of ileostomies that is favorable, around 4 per cent. I urge that there be more frequent early consultations between the physician in charge of these cases of serious ulcerative colitis and the surgeon, particularly in patients who are becoming toxic and in whom the question of surgical treatment is being even remotely considered. It is important to do this in order that one may be sure that the disease is not permitted to advance to the late stages at which the mortality rates just described result. Surgeons dealing with patients who are to have ileostomies during the acute stage of ulcerative colitis must remember that this is an entirely different operative procedure from the ileostomy done deliberately when the patient is not toxic, does not have a rise in temperature and is not an emergency. The emergency ileostomy is to be done with as little disturbance to the colon and the abdominal contents as possible and, therefore, should never be a divided ileostomy but should be the simplest possible loop colostomy, by means of which a loop of ileum can be picked up, implanted in the wound and divided with the least possible manipulation of the abdominal contents. One must not forget that in the ileostomy done as an emergency during the acute stage of ulcerative colitis any manipulation of the infected colon will result in dissemination of organisms and the production of peritonitis.

LATE RESULTS OF RADIUM THERAPY FOR CARCINOMA OF THE UTERINE CERVIX

HARRY H. BOWING, M.D.
and
ROBERT E. FRICKE, M.D.
Rochester, Minn.

The first recorded case in which cancer of the uterine cervix was treated at the Mayo Clinic with radium occurred in 1915. To date, an experience of thirty-two years has accumulated. One of us (H. H. B.) has had an active share for twenty-eight years in this special work. In no little part the experience of many workers in this field of endeavor is reflected in the study. The material contained in the tables used in this paper was furnished by the Division of Biometry and Medical Statistics of the clinic, and the inferences and statements made are based on our experience with cancer of the uterine cervix.

The first division of this study concerns the method or methods of management in these cases and indicates the source of the cases for the statistical data. The second division concerns important data about the disease and the third division concerns important data for the estimation of prognosis.

DIVISION 1

The time allotted will not permit a historical review of the diagnosis and the surgical and radiosurgical treatment of cancer of the uterine cervix. The literature contains many worth while attempts to crystallize thought based on the experience of many workers in this special field.[1] Surgical procedure has always maintained

a definite position in the management of these patients; for example, the group of patients with clearly localized lesions. Irradiation therapy has proved to be an excellent surgical adjunct; otherwise, its chief position is in the fields of treatment for patients in the inoperable, further advanced and "recurring" groups. These two distinct methods of treatment have furnished a wide range of personal therapy to meet the ever-changing demands of the individual case. With careful selection of patients for the proper method of treatment, whether for a single procedure or a combination of procedures, a good initial and enduring result will be obtained. In some cases the amount of palliation will be entirely unexpected and it may last for years.

Our first data for analysis concern the arrangement of the entire number of patients treated during the study period into groups according to the procedures or combination of procedures employed at the time of their acceptance for treatment. It must be appreciated that some of the patients were treated during the early period of our radiosurgical experience.

Table 1.—*Malignant Lesions of the Cervix, 1915-1944 Inclusive: Type of Treatment*

Treatment	Cases	
	Number	Percentage
Radium therapy alone	510	13.4
Roentgen therapy alone	127	3.3
Radium and roentgen therapy	2,246	59.2
Operation alone[*]	445	11.7
Operation and radium therapy	124	3.3
Operation and roentgen therapy	87	2.3
Operation, radium therapy and roentgen therapy	259	6.8
Total	3,798†	100

[*] Exploratory operations are excluded.

† Includes only cases in which patients were treated.

Table 1 concerns the method or methods of management of a grand total of 3,798 treated patients whose condition was diagnosed as cancer of the uterine cervix at the clinic from 1915 to 1944 inclusive. The greatest number of patients were referred to the Section on Radium Therapy, and the combined method of radium therapy and supplemental roentgen therapy was employed. This group will be considered further in other tables.

The next largest group of patients were treated with radium therapy alone. There are several reasons for this selection of our method of treatment; for example, (1) poor general condition of the patient, permitting only limited radium therapy; (2) marked obesity; (3) abandonment of radium therapy for various reasons; (4) patient elected to have the supplemental roentgen therapy given at or near her home; (5) initial roentgen therapy given elsewhere.

The next largest group of patients were treated by surgical intervention alone. In all likelihood the selection of patients for this single method was made for one of the following reasons: (1) the primary lesion was clearly localized; (2) the lesion was of a low grade of malignancy; (3) further treatment was temporarily omitted for more complete surgical convalescence; (4) patients underwent operation in the years of our early experience with radiosurgical technics. It is of interest that in previous analyses of data on cancer of the uterine cervix the percentage of patients selected for surgical treatment was in the range of 11 to 12 per cent, approximately the same as in the present study. Later on, in this study, reference will be made to this important finding.

The next largest group of patients were treated by operation, radium therapy and roentgen therapy. In the main these were patients seen early enough in the course of development of the lesion to have the benefit of a combined treatment: (1) operable primary lesion with a high grade malignant change; (2) borderline lesion found at operation; (3) preoperative radium therapy (a small number of cases); (4) postradiosurgical complications (persistent uterine discharge); (5) operable lesion with other findings indicating surgical intervention.

The next group in order of numbers received roentgen therapy alone. The selection of this single method of management may have been due to the following causes: (1) extensive involvement of the vaginal wall precluding intracavitary radium therapy; (2) limited roentgen therapy given for relief of pain; (3) unilateral edema of the leg.

The next largest group of patients were treated by operation and radium therapy. The considerations for the selection of these methods of management may be as follows: (1) borderline cases with low grade of malignancy; (2) operable cases with early recurring lesions; (3) operable cases with high grade malignant lesion.

The last group for consideration were treated by operation and roentgen therapy. The indications for this combination of methods may be as follows: (1) early and borderline lesions with a high grade malignant lesion; (2) postoperative vaginal stump with a slow or delayed healing.

No doubt there are many more indications for the selection of the method or methods employed than those listed. However, the ones suggested are in line with good radiosurgical judgment. Considering the limitations of each procedure when used alone as well as the various local and systemic conditions presented by each patient the selection indicates another attempt at personalized management. The majority of patients referred to the Section on Radium Therapy were in the inoperable or advanced stage of the disease when first seen, and the only method available for cure or palliation was radium and roentgen therapy.

DIVISION 2

The age distribution in cases of cancer of the uterine cervix varies greatly. However, the majority of patients are in the menopausal years of their lives. The age distribution is recorded in table 2. About two thirds of the entire group were from 40 through 59 years of age.

Table 2.—*Malignant Lesions of the Cervix, 1915-1944 Inclusive: Age of Patients*

[illegible]	Patients	
	[illegible]	[illegible]
40-49	731	32.6
50-59	687	30.6
60-69	302	13.4
70-79	45	2.0
80+	3	0.1
Total	2,246	100
Mean	49.1 years	
Youngest	21 years	
Oldest	82 years	

The next factor for consideration is the extent of the primary lesion at the time of the employment of the first method of management. The extent of the cancer is the most noteworthy single feature of the disease and the guiding principle in classifying cases. The terminology employed by the surgeons is as follows: (1) operable, (2) borderline, (3) inoperable and (4) terminal. The skill of the surgeon and the facilities and equipment of the hospital entered into the selection of cases for surgical intervention, and these were later considered undesirable features of a classification.

Schmitz[2] reported on a group of patients treated between April 1914 and Dec. 31, 1919. His classification was based only on the extent of the primary lesion. The terminology and definitions are as follows: (1) operable, clearly localized after a physical examination; (2) borderline, doubtfully localized after a physical examination; (3) inoperable, demonstrable invasion of contiguous tissues, organs and regional lymph nodes, after a physical examination; (4) terminal, hopeless cases. For the first group, abdominal panhysterectomy was recommended. For the second group, as well as operable cases with complicating constitutional diseases, irradiation therapy was recommended. For the third group, intensive irradiation therapy was recommended. For the fourth group, only symptomatic treatment was recommended. Schmitz mentioned passive immunity as an important factor of irradiation therapy.

The surgical terminology is the oldest, conveys definite ideas and the need for separable classes of cases and probably is the wording best understood by a large number of physicians. The College of Surgeons proposed, many years ago, a large card for the recording of data and conditions for classification of cases; however, it was not generally accepted.

The League of Nations recommended a terminology and classification[3]: stages I, II, III and IV, depending strictly on the extent of disease. The word "stage" has proved rather acceptable; however, the description of each stage, although clear, is too tedious to follow. Briefly stated the terminology used in our classification is that of the League of Nations, and the extent of the primary lesion is that rational to the clinican, surgeon and therapeutic radiologist. In stage I the lesions are confined to the cervix; in stage II there is a moderate local invasion; in stage III there is extensive local invasion or unilateral fixation, and in stage IV there is a massive local invasion or metastasis elsewhere.

To determine the extent of the primary lesion is essential for the selection of the method or methods of treatment to be employed. In some cases, this determination can be readily made by a bimanual pelvic examination and a careful inspection of the vaginal cavity and cervix. In other cases, more special examinations may be necessary to determine the extent of the local malignant involvement. For example, a lesion of the cervix may be considered to be localized and yet when a sound is passed into the cervical canal the greater portion of the uterus may be found to be involved. In another case, with only partial cervical involvement, the lesions may extend into the anterior vaginal wall sufficiently to cause a block to the flow of urine on the involved side, the onset of hydronephrosis.

Another difficulty is the attempt to separate other pelvic pathologic conditions from the malignant involvement, such as the residue of an old pelvic inflammatory disease, fibroids and tumors of the ovary. In some cases, it may be necessary to defer determination of the stage of the primary lesion until the time when the initial radium treatment is about completed. Nearly all stage IV and some stage III classifications furnish a real problem in determining the primary lesion immediately.

The study group furnished 2,146 cases classified according to the stages which we proposed in table 3.

TABLE 3.—*Malignant Lesions of the Cervix, 1915-1944 Inclusive: Stage of Involvement*

Stage of Involvement	Cases	
	Number	Percentage
I	27	1.3
II	306	14.3
III	1,419	66.0
IV	394	18.4
Total	2,146*	100

* There were 100 patients in whom the stage of involvement was unknown.

There were 15.6 per cent in a favorable unit (stages I and II), while the majority (66.0 per cent) were in an unfavorable unit, and 18.4 per cent were in an apparently terminal phase of the malignant disease. In the discussion of table 1, it was emphasized that 11.7 per cent of the patients were treated by surgical procedures alone, indicating the proportion of favorable cases occurring in the grand total of 3,798 cases. The patients referred to the Section on Radium Therapy may be considered a selected group of patients, and yet when analyzed according to favorability the percentage figures are relatively comparable. For the purpose of further comparison with other statistical data occurring in the literature, they may be considered as an average unselected group of patients who have cancer of the uterine cervix. There is a possible difference, in that the favorable group in table 3 may contain a large number of older patients, obese patients and those with complicating systemic diseases contraindicating radical surgical intervention.

The patient's age and stage classification are an important combination of factors in that they influence the selection of method or methods of treatment. For example, young patients tolerate radical surgical procedures better than their seniors. A combination of favorable factors for adequate surgical intervention would be (1) a young patient with a stage I lesion, or (2) a selected patient with a stage II lesion, (3) all in perfect health. Considering only the first two factors (age and stage), table 2 lists 21.3 per cent 39 years of age or less, table 3 lists 15.6 per cent in the favorable stages and the mean age of the patients in stage I as recorded in table 4 was 54.5 years. The number of cases for this special consideration is too small for statistical purposes; as a rule, patients with the combination of favorable factors are exceptionally few. The mean ages of patients in stages II and III are similar and approximate the average age of the entire group. The mean age of patients in stage IV is 0.9 year greater than the mean age of those in stage III. This difference may indicate the mean length of time necessary for a stage III lesion to advance to a stage IV involvement.

The modified patients furnish an interesting and important classification for analysis and are always too large a group to be ignored. We have chosen the term "modified" for this group of previously treated patients because it is almost impossible to obtain all the necessary data to establish the stage of the lesion when the patient was first considered or treated (elsewhere). In some of the cases it is obvious that the treatment given was intended for palliation and, of course, residual cancer tissue was found present at the time of our examination. Incomplete information records many types of procedures, for example, dilatation and curettage, chemical and actual cautery, cervical amputation, electrosurgical procedures, and so forth. These procedures proved to be inadequate, and yet some temporary benefit occurred in that a local arrest of the surface phase of the disease resulted in diminished ulceration, infection, loss of blood, and so forth. However, the anatomic landmarks were destroyed and the resulting effect modified the primary lesion to such an extent that only limited radium therapy could be applied. Some of these cases require something special of the therapeutic radiologist; they are more tedious to manage and an extra amount of responsibility must be assumed. The immediate and late results obtained have always been a real pleasure to report and a great surprise to all concerned; however, they always reduce our five year cure rate. The mean age of this group, 46.4 years, was nearly three years less than the average age of the entire group. This feature may be due to the many different methods of treatment selected and applied elsewhere by physicians in various specialties.

DIVISION 3

Our final consideration concerns the factors necessary for an estimation of the probable prognosis. This determination cannot be definitely stated when a patient who has cancer of the cervix is first seen by the surgeon or radiosurgeon. However, one may attempt to evaluate for the patient's family or responsible party the chance of cure or palliation only. Today, there are many encouraging features that the patient should know and there are many other features that the relatives or responsible party should know. A statistical study, as presented, does not evaluate the kind or degree of palliation that is most certain to occur in all treated patients. The constant obnoxious vaginal discharge, the odor, the pain, the bleeding and hemorrhage are certain to yield for various periods, naturally depending on the serious features of the disease and place of treatment. The immediate result is always uppermost in the minds of the patient and her relatives. The five year salvage and beyond surely enters into their consideration, but their chief concern centers about the relief or "help" that the patient may obtain rather promptly, and from these early responses they derive their encouragement and faith in the method selected. In all likelihood little do they realize that the surgeon and radiosurgeon are equally interested in the initial response to the method selected for their recovery.

The surgeon knows from long experience in this field that a good immediate result is the best assurance of a good lasting result. Only a few postsurgical months are necessary for this evaluation. In the event that the disease recurs locally the chance of recovery from a second surgical procedure is almost nil. This is an important observation and a valuable lesson for the radiosurgeon to learn and to remember. His method of attack has some features similar to that of surgery. The important one is that irradiation in a measure is a local attack on the disease, and his success depends on the skill and judgment used in completely or adequately treating the visual and palpable expressions of the disease. The recognition and treatment of the local gross pathologic changes should be his chief concern. His limitations are also comparable to those of the surgeon in that an immediate good response is the first part of a good and lasting result. If a second application is necessary after a few post-treatment months, the chance of a permanent recovery from a second application of treatment is also almost nil. It seems reasonable to assume that all single methods of management have their limitations and that by a combination of selected methods in proper sequence the most good can be obtained for the patient. Secondly, each patient presents individual problems which demand individual management. So far, there are no mass production procedures that will effectively control the malignant disease.

Our first consideration is the influence of age on the five year survival rates. Our data are contained in table 5. Included in the table are only those patients treated five or more years prior to the time of inquiry; that is, in 1939 or earlier. For simplification the patients are grouped in decades. The age group 20 to 29 years and the age group 70 years or more furnish only a small number of patients. Of the patients traced in the first group 25 per cent lived five or more years after leaving the hospital, while of the later group 36.4 per cent lived for the same period. The results obtained in these two groups compare favorably with the average result (32.8 per cent) obtained for the entire group. It is apparent that these groups will always contain few patients for statistical study. The next unit for comparison is the 30 to 49 year group, of which 29.5 per cent were living five or more years after leaving the hospital. Of the patients traced in the next unit, the 50 to 69 year group, 36.9 per cent were living five or more years after leaving the hospital. The difference of 7.4 per cent is no doubt significant and is in favor of the older patients. The data presented in table 5 adhere to the general idea that youth unfavorably influences the chance of five year survival. However, in this study the unfavorable factor is relatively small, and furthermore the favorable factor is relatively good in influence on the five year survival rate.

TABLE 5.—*Malignant Lesions of the Cervix, 1915-1944 Inclusive: Five Year Survival Rates According to Age of Patients*

Age, Years	Patients* Total Number	Patients* Number Traced	Lived 5 or More Years After Leaving Hospital Number	Lived 5 or More Years After Leaving Hospital Percentage of Traced Patients

Total	1,799	1,581	519	32.8

*Inquiry as of Jan. 1, 1945. Included here are only those patients treated five or more years prior to the time of inquiry; that is 1939 or earlier.

Our second consideration is the influence of grade of malignant change on the five year survival rate. It is based on data contained in table 6. Included in the table are only those patients treated five or more years prior to the time of inquiry; that is, in 1939 or earlier. The work of MacCarty[4] and Broders[5] on the cytologic studies on surgical material has advanced our knowledge regarding the defense mechanism of the body against the destructive character of neoplastic disease. MacCarty grouped differentiation, lymphocytic infiltration, fibrosis and hyalinization all as part of this defense system. He found that when these factors are favorable, the postoperative longevity is 146 per cent greater. Broders' method of grading is a serviceable contribution and of great value to both surgeon and radiosurgeon. In this study and in previous ones the high grade malignant lesions predominate (table 6), and it is this unequal distribution that makes comparison impossible. We do not recall treating a primary grade 1 squamous cell epithelioma of the cervix. A few such lesions have been treated; however, they were secondary to leukoplakic cervicitis. The grade 1 lesions are adenocarcinomas. In this study, there were only 9 patients with grade 1 malignant change. Of the patients traced 57.1 per cent lived five or more years after leaving the hospital. This is an extremely small number of patients. However, linked with grade 1 malignant lesions occuring in other anatomic locations these lesions are not definitely radioresistant. The radiosurgeon prefers to treat these lesions on the same basis as the surgeon does, in that they are slow to spread locally and elsewhere in the host. The grades 2, 3 and 4 occurred in sufficient numbers for comparisons. Of patients with a grade 2 lesion who were traced, 39.8 per cent lived five or more years after leaving the hospital. Of patients with a grade 3 lesion who were traced, 38.2 per cent lived five or more years after leaving the hospital. Of patients with a grade 4 lesion who were traced, 36.4 per cent lived five or more years after leaving the hospital. The differences between successive grades in these percentage figures are 1.6 per cent and 1.8 per cent respectively, small differences indeed. The difference in percentage cure rates when lesions of the various grades are treated surgically is most pronounced, as previously stated. Of patients without a record of the grade of the lesion who were traced, 19 per cent lived five or more years after leaving the hospital. The reason for the rather low comparative five year survival rate for this group is not indicated. In the early years of radiation therapy the grade was not determined. There is a possibility that the influences of age, stage, grade and limited radium therapy are all reflected in this low percentage figure.

* Inquiry as of Jan. 1, 1945. Included here are only those patients treated five or more years prior to the time of inquiry; that is, 1939 or earlier.

Naturally, these data are disturbing to both surgeon and radiosurgeon; to the former, because the results in grades 2, 3 and 4 are so near equal, and to the latter, because radiosensitivity is more complex than the microscopic analysis of grading. Grading may be a factor in estimating radiosensitivity and an index of immunity. However, as yet there is no acceptable method of grading radiosensitivity by microscopic cellular studies or any other type of study. It is definitely appreciated that severe secondary anemia, malnutrition and systemic diseases will influence radiosensitivity unfavorably. The importance of a good blood supply to the tumor bed is well established. The judgment, skill and radium therapy technic of the radiosurgeon can favorably influence radiosensitivity.

From our standpoint, we consider that this similarity of result in grades 2, 3 and 4 is due to the method of radium therapy which we apply. The individual response in the early days of the radium treatment is observed and recorded. The response in some patients is prompt, while in other patients the response is slow The patient with a prompt response receives less intensive therapy, or a longer interval between applications is allowed to take place It is equally important that the radium applications be well distributed throughout the involved genital tract. Patients with potentially serious local complications, such as inflammation, ulceration, necrosis and bleeding, are seen and treated almost daily until the condition is under control. The wounds are surgically treated and dressed in a similar manner to wounds occurring on the body surface. The factor of time between the applications of radium is important and yet must not be prolonged. These brief remarks will help to formulate some idea concerning our efforts to individualize the radium therapy to meet the personal requirements of each patient and are offered as an explanation for the similarity of results obtained in the various grades of malignant lesions. The total treatment time for the average patient with stage III classification including both radium therapy and supplemental roentgen therapy is about three weeks. The roentgen treatment is begun during the final days of the radium therapy. The treatments are given daily. Two anterior and two posterior fields are treated, the factors being as follows: 200 kilovolt equipment with a total dosage of 500 to 700 r per field. A second course may be given after an interval of three months.[6]

The post-treatment convalescence is, as a rule, a mildly distressing experience. It endures for a few days and gradually subsides. Abdominal cramps, diarrhea and tenesmus may occur. These reactions may be severe and demanding in the susceptible patient. Patients with serious late sequelae are few.

The importance of a well planned follow-up system cannot be overstressed. We recommend reexamination every three or four months for the first post-treatment year, every six months for the second post-treatment year, and every year thereafter. In the main, the period of palliation can be prolonged.

Our last consideration is the stage of the primary lesion and the late result obtained. The former is the most important single feature of the disease in the estimation of t in table 7 include all those patients treated five or more years prior to the time of inquiry: that is, in 1939 and earlier.

Not stated	52	45	19	42.2
Total	1,799	1,581	519	32.8

* Inquiry as of Jan. 1, 1945. This group includes only those patients who were treated five or more years prior to the time of inquiry; that is, in 1939 or earlier.

The number of early or favorable cases in which treatment for cure is practicable is always low, an estimated 10 to 15 per cent of the grand total. Of the patients in stage I who were traced 58.8 per cent, and of those in stage II 65.3 per cent, lived five or more years after leaving the hospital. The difference of 6.5 in the percentage between stage I and stage II may be due to the factor of age as shown in table 4, in that the mean age was greater for the patients in stage I than for those in stage II. Of the patients in stage III who were traced 33.7 per cent, and of those in stage IV, 16.5 per cent, lived five or more years after leaving the hospital. Of the patients traced in the modified group, without classification by stage, 25.1 per cent lived five or more years after leaving the hospital. Of the patients traced who lacked a classification by stage 42.2 per cent lived five or more years after leaving the hospital. Evidently the majority of these patients would have been in stage III if the classification had been recorded for them.

Finally, hospitalization is required for radium therapy for cases of cancer of the uterine cervix. The number of admissions varies from 1 to 2 or more a week for the two to three weeks or more, depending on the stage classification. The morbidity rate is low. This feature of the management was not considered in this study.

There were 5 deaths in the hospital (0.2 per cent) for the group of 2,246 patients receiving radium therapy and supplemental roentgen therapy.

COMMENT

The group of patients furnishing the data for this study may be considered a selected group in that they were referred to the Section on Radium Therapy. The proportion of favorable cases was in the range of 12 to 15 per cent, while the proportion of favorable cases selected for surgical intervention in a larger group was in the range of 11 per cent. These comparable figures may indicate the presence of a common denominator in the first-mentioned group. It can be further recorded that the favorable cases in the study group contained more cases with obesity, more older patients and constitutional diseases than the second group used for comparison.

Multiple methods of management, in proper sequence, will furnish a flexible plan of treatment, so that all classifications of the disease may be accepted for cure or palliation with the exclusion of the obviously terminal cases.

The majority of patients treated by the radiosurgeon are in the inoperable and "recurring" stage classifications of the disease, a fact which definitely limits his attempts to determine the site of the primary lesion, as well as his endeavors regarding adequate treatment.

Cancer of the uterine cervix is characterized by the host. Each patient requires individualized treatment. The radiosurgeon must plan and apply a radium therapy technic based on the gross visual and palpable features of the malignant lesion.

The day to day response to the radium therapy technic selected and applied will furnish some estimation of the dosage to apply for a complete treatment intended for cure or a limited treatment intended for palliation.

Palliation is an immediate and dependable result. The tendency to bleed may be favorably influenced in a few days after the first application of radium. Relief of pain may occur in a few days or after the second or third application of radium. The odor and discharge will diminish in seven to ten days, and this result can be accelerated by the employment of supplemental vaginal hygienic treatments by the radiosurgeon. The control of the primary lesion prevents extension to the local urinary system and rectum, thus putting in the background the distressing and embarrassing complications of vesicovaginal and rectovaginal fistula. Unilateral edema of an extremity may not yield to irradiation therapy. However, proper elevation of the involved member will reduce the edema. Palliation is the important consideration during the early days of the radium applications, including supportive therapy to accelerate the reduction of the severity of the malignant disease.

The average age of the patients in this study group was 49 years. Evidently the disease may occur at any age. There is no pronounced influence of the age of the patient on the stage classification of the lesion.

The grade of malignant change was originally based on the cellular study of postoperative material. This determination is of especial value to the surgeon in estimating the probable postoperative longevity and, further, it indicates the degree or index of the patient's resistance to the neoplastic disease. Surely this is a serviceable contribution to our knowledge of cancer.

The grade of malignant change is important information for the radiosurgeon, in that it serves as a guide in the selection of a method or methods of treatment and their sequence for an individual case, to insure the best chance of five year survival after the patient leaves the hospital and the greatest amount of palliation with a minimal chance of distressing sequelae.

All grades of malignant lesions of the uterine cervix are radiosensitive. The response to treatment is governed by the radium therapy technic employed. The radiosurgeon prefers to treat low grade malignant lesions in the favorable classifications on the same bases as the surgeon, in that, if they are adequately treated, the chance of recovery is good because these lesions are less malignant and do not metastasize early.

As yet, there is no acceptable determination of the degree or kind of radiosensitivity. Evidently the response to irradiation therapy obtained is a relative one, depending on the general condition of the patient, the location and extent of the disease, the cellular characteristics of the lesion, the method or methods of treatment and their sequence, the dosage and distribution of the irradiation therapy, the age of the patient, the control of the many simple and serious complications, and so forth.

So far, chemical science has not developed an accepted clinical laboratory test to determine the presence of active immunity to the malignant cellular process in a patient who has cancer. The grade of malignant change may indicate the presence of a resistant factor, in that the grade I lesions are characterized by slow growth and a decidedly reduced tendency to metastasize, while the grade IV lesions are characterized by rapid growth and a decidedly increased tendency to metastasize. These differences are not apparent when the various grades of malignant lesions are treated by irradiation therapy. The grades II, III and IV are in sufficient numbers for comparisons. The results or five year cure rates obtained in these respective grades are approximately equal. The radium therapy technic not only controls the primary lesion but also has some favorable influence in controlling the metastatic features of the disease. This finding has a serviceable application, in that all patients who have high grade cancers in the stage I and II classification should be considered candidates for adequate preoperative radium therapy and there should be an interval, at least in months, for passive immunity to develop, in order to protect the patient effectively before adequate surgical procedures are carried out. There is a possibility that, if the same consideration were applied to the low grade lesions in the same classifications, the ultimate prognosis would show improvement. These implications are contained in the statement concerning method or methods of treatment and their sequences.

The patient 49 years of age or less has a mildly unfavorable factor influencing the five year cure rate, while the patient more than 49 years of age has a definitely favorable factor influencing the five year cure rate.

The stage of the primary lesion is the most important single finding that definitely influences the early and late results to be obtained. Patients in stages I and II have the best chance for five year survival, those in stage III have a fair chance for five year survival, while those in stage IV have a poor chance for five year survival.

The 5 deaths in the hospital recorded for this study group are surely few. The deaths occur in stages III and IV.

CONCLUSIONS

The study period, 1915 through 1944, includes the early years of our experience with radium therapy and roentgen therapy. During this time 2,246 patients who had cancer of the uterine cervix were referred to the Section on Radium Therapy and treated. This group furnished the data and the Division of Biometry and Medical Statistics arranged the material in the tables used in the paper. All inferences and statements concern cases of cancer of the uterine cervix.

The method or methods of treatment employed were intended to meet the individual therapeutic requirements of the patient and thus to reduce the severity of the disease. Some of the treatments were designed for cure and some for palliation only. The broken dose intensive radium therapy supplemented by roentgen therapy was employed. A therapeutic rationale is presented. Recheck examinations in the post-treatment months and years are necessary.

Eighty-five per cent of the patients had advanced cancer when treated. A small percentage were in the favorable stages of the disease. Many cases were modified and the plight of the patients was too perplexed to be disregarded. Their numbers reduce our average five year cure rate.

Patients of 49 years or less did not obtain as good a result as those past 49 years of age. The mean age was 49.1 years.

The various grades of malignant change responded equally well, in that the five year survival rate for each grade was almost similar. The grade 1 lesions were few and the patients in this class obtained the best five year rate. High grade malignant lesions predominated.

Sixty-five per cent of the patients in stage II lived five or more years after leaving the hospital and 33 per cent of the patients in stage III lived five or more years after leaving the hospital. Five year cures occurred in all classifications.

The treatment was well tolerated. There were 5 deaths, or a hospital mortality rate of 0.2 per cent. The serious morbidity rate was equally low.

ABSTRACT OF DISCUSSION

Dr. Leda June Stacy, White Plains, N. Y.: In the days before the valuable work of the physicists, Drs. Viol, Failla and Quimby, and the study of cross firing by roentgen radiation by Dr. Henry Schmitz and others, we felt our way as to dosage and screening, largely by trial and error, and treated only the inoperable cases. In some of these extensive cases there was observed remarkable improvement in the local lesion and in the general condition of the patient. It was due to these unexpected favorable results that the surgeons began to refer the less extensive cases to the radiologic department for treatment with radium and roentgen rays alone or combined with surgery. In 1920 Broders published his classification of cancer cells, giving us valuable information regarding the radiosensitivity of the lesion, thus enabling the surgeon and the radiologist to select more accurately the treatment best suited to the individual case and also to aid in the prognosis in a given case. In the early days at the Mayo Clinic small doses of radium were given at longer intervals, but too often vesicovaginal and rectovaginal fistulas developed as a result of exposing tissue whose blood supply had been interfered with to more radium. Also, occlusion of the cervix or of the vault of the vagina occurred, preventing further application of radium. This technic was soon changed, as it was in most clinics, to that of giving the total amount of radium into the uterus, the cervix and vagina at one sitting or in divided doses over a period of two or three weeks, then cross firing with the roentgen ray. In some clinics as in the White Plains Hospital, in cases of extensive involvement of the cervix with hemorrhage or infection the roentgen treatment is started first, to be interrupted at such a time as examination shows the cervical canal to be opened sufficiently to enable insertion of the radium without trauma, roentgen treatment being resumed after completion of the radium treatment. In the extensive case with involvement of the parametrium, preliminary investigation of the urinary tract may lead one to modify the treatment in such a way as to avoid later occlusion of ureters by postradiation edema or infiltration. The differential diagnosis between extension of the cancer and tissue reaction to radiation is always a difficult problem when examination two or three years after treatment reveals fixation of the uterus and induration in the broad ligament area. Reexamination in two or three months' time usually reveals the nature of the infiltration. Factitial cystitis and proctitis are problems, also. The question arises whether the lesions are new growths, extension from the original lesion, or late reactions to the radiation. Careful observation over a period of two or three months usually settles the question. Dr. Bowing's and Dr. Fricke's statistics are most interesting and bear further study. The age grouping is to be noted, in that 2.2 per cent of their patients were between ages of 20 and 29 years of age, and 19 per cent were between 30 and 39 years of age; of these 25 per cent and 29 per cent respectively lived five or more years, while of the 30 per cent aged between 50 and 59 years, 34 per cent survived five years or more, showing that the younger the patient the poorer the prognosis. The results recorded that of the 188 patients traced who had surgical, radium and roentgen treatment, 60 per cent lived more than five years. These last figures demonstrate the advantage of selection of treatment best suited to each patient, considering the grade of the cancer and the stage of the disease and the age and general condition of the patient. The fact that 21 per cent of the 1,380 patients traced, who had received their treatment ten years or more previously, lived for ten or more years is the reward for the patience and attention to detail exhibited by the essayists and is the result of close cooperation between clinician, pathologist, surgeon and radiologist.

GENERAL PRACTITIONER SESSION

UPHOLDING THE PRESTIGE OF THE GENERAL PRACTITIONER

WINGATE M. JOHNSON, M. D.
Winston-Salem, N. C.

When I was asked to discuss this subject, just out of curiosity I consulted Webster's dictionary to see exactly what "prestige" means. I found that the word comes from the Latin *praestigium*, meaning "delusion," "illusion." The first meaning given was "a conjurer's trick; a sorcery; an illusion; a deception." The second meaning was "power to charm, dazzle, or command admiration; hence, eclat, renown." The third, the most common today, was "ascendancy derived from general admiration or esteem; commanding position in men's minds."

These three definitions represent an evolutionary process. Unfortunately the first and second meanings still apply to the exalted position of the specialist. Specialism is allowed to dazzle entirely too much; there is an illusion about it which we should get away from. The prestige of the general practitioner is based on the final meaning of "prestige" "ascendancy gained from general. . .esteem." That is a solid foundation which has endured for centuries.

Concern over specialization is not new. Plato said, more than 2,400 years ago: "If the head and the body are to be well, you must begin by curing the soul. . . This is the reason why the cure of so many diseases is unknown to the physicians of Hellas because they are ignorant of the whole, which ought to be studied also; for the part can never be well unless the whole is well."

Those who have read "The History of the American Medical Association" which was published recently may recall that as far back as 1866 the Committee on Medical Ethics decided that the disadvantages of specialization "could be overcome if the specialist would begin as a general practitioner and gradually grow into his specialty." It is interesting that this idea is being revived today. In 1883, Nathan Smith Davis, the founder of the American Medical Association, deplored the growing interest in specialization. Osler, in 1902, said, "It is amusing to read and hear of the passing of the family physician."

Many of you can remember that after World War I there was a similar trend toward specialization, which was halted by the economic depression beginning in 1929. During this period many doctors were forced to give up their work for more lucrative, but less glamorous positions, such as operating elevators. So far as I know, none of these were family doctors.

Among the factors favoring specialization are the specialty boards; the higher fees paid specialists by the Veterans Administration, workmen's compensation commissions and similar organizations; the fact that medical schools are encouraging their students to specialize and the fact that some hospitals are closing their staffs to general practitioners.

I believe that it is a studied policy of Isadore Falk and his followers, who are attempting to socialize the practice of medicine, to drive a wedge into the medical profession. They advocate group practice by specialists and belittle the individual or "solo" practitioner, and also the doctor-patient relationship. One example of the type of propaganda which they are employing is the booklet "Solo or Symphony?" which leaves the impression that medicine in the future must be practiced altogether by individuals or altogether by groups. It overlooks the fact that, while some cases need concentrated study by a specialist or group of specialists, the vast majority (85 per cent is the usual estimate) can be cared for by the general practitioner.

Access to the hospitals for the family doctor is unquestionably one of the most important and urgent problems before the medical profession today. There are any number of indications that this situation is improving and that we are witnessing the renaissance of the general practitioner. More hospitals in rural areas are to be built under the Hill-Burton Act. The Council on Medical Education and Hospitals has recently said that "....it was never intended that staff appointments in hospitals generally, or even in hospitals approved for residencies, should be limited to board-certified physicians as is now the policy in some hospitals. Such policies... are detrimental to the health of the people, and therefore to American medicine. Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients as judged by the professional staff of the hospital and not on certification or special society memberships. In this opinion, the Council has the full concurrence of the Advisory Board for Medical Specialties."

The American Board of Obstetrics and Gynecology, at its last annual meeting in June,

---

Read in the Session on General Practice at the interim meeting of the American Medical Association, Cleveland, Jan. 6, 1948.

adopted the policy that "....the Board does not subscribe to any hospital or medical school rule that certification is to be required for medical appointments in ranks lower than Chief or Senior Staff of hospitals, or Associate Professorship in Schools of Medicine, for the obvious reason that such appointments constitute desirable specialist training." It is likely that other specialty boards will follow suit.

As has been stated by the Joint Committee for Coordination of Medical Activities, "there is an immediate need for integration of general practitioners into hospital staffs throughout the country." Graham Davis, president of the American Hospital Association, said, "I think it would be the general policy of the American Hospital Association to say that every reputable physician should have a hospital staff appointment."

There is every reason for the general practitioner's morale to be elevated. Numerous articles by both physicians and laymen have emphasized his position as the central figure of the medical profession. This meeting is dedicated to the general practitioner. The American Medical Association, at this interim session, has awarded a special honor to a general practitioner who has done outstanding work. The public is demanding the general practitioner.

In order to uphold and maintain his prestige, the general practitioner must do five things:

1. He must combat an inferiority complex. There has been a concerted effort to force this on him by the advocates of political medicine. The general practitioner needs to realize that he is just as much a doctor as is the specialist, and he must not allow any feeling of jealousy or envy to creep into the picture. He can take care of 85 per cent of illnesses and leave the remaining 15 per cent for the specialist.

2. The general practitioner must keep up with medical progress by reading, by attending medical meetings and by informal consultations with his colleagues.

3. He should, so far as possible, systematize his work, have regular office hours and allow enough time for every new patient. One sixty minute interview is worth much more than four fifteen minute interviews. He should keep records.

4. The general practitioner should aspire to be a family doctor rather than a general practitioner in the literal sense. He looks after the family. That is his first thought. Most of his work is apt to be medical. If he can do the work, he should do it; and if he cannot, he should turn it over to the specialist.

5. It is important that the general practitioner work in harmony with the specialist. They need each other and have much to learn from each other. All the members of the medical profession must band together against their common enemies.

THE GENERAL PRACTITIONER AND COMMUNITY LEADERSHIP

FRED STERNAGEL, M. D.
West Des Moines, Iowa

There is an incident of the demagogue in the French Revolution who said, "There go the people; let us hurry and overtake them—I am their leader."

The general practitioner of medicine stands in a peculiar relationship to the people of the community in which he serves. At least, that relationship is peculiar if one allows that a community is more or less limited in area, not quite urban and not quite rural. One may define a community somewhat arbitrarily as the smallest unit that will hold itself together and in which individuals live in groups either organized or unorganized, through which they express their needs, desires, purposes and interests. Such a social unit of course embraces more than the mere geographic limits of a town or a city. It reaches out and includes those elements which react on the business, social, educational, religious and cultural life of the group and influence its character.

The general practitioner has, as I have said, a peculiar relationship to all these phases of community activity, a relationship that no other person could ever enjoy. I care not what type of community activity one calls to mind, there is a physician involved somewhere—or else there is a question of medicine or health demanding the attention of someone trained in medicine.

THE TRADITIONAL RULE

This has always been true. In the earliest primitive communities, the physician—or the medicine man, as he was termed—was actually more powerful than the king or potentate. In fact, he was usually the king or potentate because his "medicine" had been proved "stronger" than that of any of his rivals. In such a situation the physician was a community leader in a literal sense. His leadership today is somewhat less apparent, where it exists, but it is nevertheless equally significant.

In a growing society it is not allowable for any one to shirk his share of community responsibility, nor can any waste of power be permitted. Accordingly, in earlier days, the carpenter was expected to direct the building of the stockade and the lawyer was expected to give part of his time to the shaping of the public statutes. Nor was there any doubt as regarded the nature of the physician's community duties. Plainly he was expected to give to the community the benefit of his special knowledge in matters of public hygiene and health, and he was expected to take professional care of those who were dependent on public support.

Read in the Session on General Practice at the interim meeting of the American Medical Association, Cleveland, Jan. 6, 1948.

In that period—and to a considerable extent the same situation prevails today—the physician gave his best advice about the water supply and about the disposal of sewage and garbage; he also gave attention to the health educational interests of the community, not only safeguarding the health of the school children, but seeing that some of them were fitted to be his assistants and successors; and even more plainly it meant that he must lead the fight against all contagion and infection, that he must plan hospitals and devote himself to their management.

As the community, which we are now imagining, grew larger, and as many physicians followed the footsteps of the individual pioneers, they were being facilitated in these special duties of citizenship by civic and public organizations intended for the improvement of health needs in their communities such as public health boards and councils, special committees on health and societies for the control of tuberculosis, cancer and other diseases. The inception of of these groups does not in the least detract from the responsibility that the physicians still owe their communities; in fact, it increases that obligation with respect to assisting these organizations in the medical problems which are primarily in their sphere. Unfortunately, in many areas of our country the physicians have forgotten or are not aware of their traditional role as the guardians of the health of their communities. Many doctors make little or no effort or show no inclination to place themselves in these circles which are dictating policies that increasingly involve problems of medical care. Instead, by his indifference the physician permits these groups to operate on information from questionable sources and make decisions which are born without his counsel. Too often the physician's only contribution is a howl of protest when some of these activities propagated under such circumstances have savored of socialized medicine.

One must not forget that the general practitioners, not the specialist, by reason of their traditional and recognized status in the community have every right to leadership in these councils if they will only signify their intention to participate and show a willingness to be of service in this direction.

PRIMARY FIELDS OF LEADERSHIP

Bearing in mind that the physician's community leadership involves those functions of government for which his education and experience have especially fitted him, and which cannot so well be performed by the laity, one finds these functions dividing naturally into two primary classes; (1) the direction of organization processes, so far as the physical welfare of the public is concerned, in any part of the wide domains of the medical profession; (2) legislation and administration necessary for the preservation of public health and physical well-being; for the exertion of such influence the general practitioners are qualified by training, experience and influence in a community. These are the primary fields of leadership. There are other secondary fields which I shall mention shortly.

The general practitioner should be the community leader of the health objectives and efforts in public education. Health is the undeniable heritage of every man, woman or child. The people are preparing to guard this heritage on a larger and better scale than ever before. The general practitioner is in an excellent position to meet with them and map out programs and procedures directed toward the improvement of community health through the education process.

In the matter of civic administration and legislation the general practitioners in the average community find themselves in an advantageous political situation, since most of the legislators, whether they be local, state or national, have them as family physicians or belong to one of their clubs. Whenever the community has been properly taught the importance of good public health measures, such work has been cheerfully supported by these representatives.

SECONDARY FIELDS OF LEADERSHIP

Such are the primary fields of leadership in which the general practitioner has an important role. I have already referred, in passing, to the secondary fields: business, social, educational, religious and cultural. The unique position which the general practitioner occupies in the community—growing out of public trust and public confidence in his integrity and ability—makes him at once a leader in community activities in which health and medicine have little or no direct bearing.

In most small communities, the general practitioner exerts much influence in business circles. There is hardly a chamber of commerce or other civic society which does not have as one of its prominent members the local family doctor. In many instances his educational background and his vast experience in human relations enable him to maintain a position of counsel in the business affairs and civic affairs of his community. The general practitioner may not be a businessman himself—in fact, most family doctors are anything but good businessmen, if one is to judge purely on the basis of profit and loss. But he is economically dependent on the community and the community is in a sense economically dependent on him. In the community civic circles the general practitioner will usually receive the respect which he deserves.

In purely social affairs, the family doctor also occupies a unique position. He knows intimately so many families in the community, he is so familiar with their problems, their successes, their tragedies, that no community social circle appears complete unless "Doc" is a part of it. Then again, the general practitioner recognizes that his own work is rendered much more effective when there is a close community spirit growing out of wholesome social relationships among the members of his community.

I have already referred to his leadership in matters of education relating to health; that same leadership carries over into the purely academic aspects of public education. The general practitioner in the smaller community—and in large cities as well—is usually urged to serve on the local board of education. The physician's relationship to the school is a close one; here again his broad view of community problems and personalities qualifies him to assume a position of leadership.

In most communities the family doctor is almost as much of a religious leader as the minister. As "father confessor" he finds himself involved in situations in which spiritual considerations are hardly to be distinguished from the purely material aspects. As an intermediary in "life and death" relationships, the general practitioner is required to be a healer of the soul as well as the body. He may be unaware of the psychosomatic aspects of his medical practice, but they exist none the less. He knows that faith may work wonders where spesifics and antitoxins are helpless. The mission of medicine is no less spiritual than material, and the doctor is a minister in a real sense. He does not usurp the position occupied by the priest or pastor, but his work is a vital supplement to the less practical matters of theology.

QUALITIES NEEDED

Some one once said, "Nowadays the ocean seems to be a large body of water entirely surrounded by trouble." Our own troubles--the troubles of the physician--become less important when we view them in the light of a larger world, national and community troubles. The need for leadership was never so great as now. We always need leadership and leadership of superior effectiveness. The qualities which the general practitioner needs as a leader in his community are the same as those of leaders in any field. Knowledge and ability and experience are required, knowledge and ability to judge wisely in all issues, experience of long practical dealing with difficult problems, with a record of using those experiences for self education and self training.

Sincerity, pure devotion to straightforward principles involved, is another requirement. Not common honesty alone but intellectual honesty; the honesty of the Scotch preacher who prayed, "O Lord guide us aright, for we are verra, verra determined."

Enthusiasm is needed, earnest controlled enthusiasm, that will not carry one too far ahead of the van or two far afield from the point at issue. Not the enthusiasm of the young lawyer who, on receiving a promotion into the firm, hurried home, rushed into the arms of his wife, kissed her--then rushed into the kitchen, kissed the cook and upset the soup. A leader must possess a certain restraint.

Shall we prove ourselves worthy of our inheritance? In times of peace and prosperity shall we begrudge giving some small portion of our time to community leadership? Rather, as we perform our routine responsibilities, we must willingly assume our extraprofessional obligations.

SUMMARY

Leadership of the general practitioner is assumed in both primary and secondary fields. The primary fields are those having a direct bearing on medicine and health, health education and health legislation. The secondary fields are business, social, educational and religious.

THE GENERAL PRACTITIONER

How To Create More of Him for the Future Needs of the Country

CHARLES F. WILKINSON, M. D.
Ann Arbor, Mich.

The University of Michigan Medical School has developed a plan which is intended to start about July 1, 1948.

These two-year general residency programs provide two years of training to develop a general practitioner with a possible third optional year

We have affiliated with two hospitals; there will be two interns and one general resident on duty at each hospital at all times. In addition there will be two interns at the University Hospital in Ann Arbor for each of the two affiliated hospitals, making a total of four interns, who will, after six months, rotate with the four interns at the two affiliated hospitals. This will mean that eight interns during the period of one year will have six months' training at the University Hospital and six months' training at one of two affiliated hospitals.

There will be a resident in internal medicine or a resident in surgery who will change every six months, so that over a period of a year there will be two men from the services mentioned at the University Hospital who will rotate through the affiliated hospital.

Read in the Session on General Practice at the interim meeting of the American Medical Association, Cleveland, Jan. 6, 1948.

From the Department of Internal Medicine and the Office of Decentralized Graduate Medical Education, University of Michigan Medical School, Ann Arbor, Mich.

Each hospital affiliated will be expected to conform to all the basic teaching requirements asked for in those hospitals affiliated in our present Decentralized Resident Training Program for training in the specialties. This means that the following will be undertaken by each affiliated hospital: (1) a clinical pathologic conference once a week for nine months of the year which will alternate with medical and surgical cases; (2) a roentgen conference weekly for nine months of the year which will stress diagnosis rather than therapy; (3) a clinical conference once weekly that will stress diagnostic and therapeutic measures; (4) each service will be headed by a specialist certified by that respective board or fellow of that respective college; (5) teaching ward rounds will be conducted by the hospital visiting staff at least one hour per day, five days each week.

During the second year or general resident year there will be one general resident at each hospital at all times or, if it seems feasible, two general residents at each hospital at all times, and there will be one or two at the university who will be continuing work, both clinical and preclinical, as I will point out later. Let us consider one man of the eight who will be trained, starting with his intern year; his service will be essentially as follows: Six months at the University Hospital which will include two months of internal medicine (wards), two months of dermatology (outpatient) and two months of surgery (outpatient). He will spend six months at the affiliated hospital, where the services will be divided into a medical service which will include obstetrics, psychiatry, neurology, dermatology and any other nonoperative specialties, and a surgical service which will include all the operative surgical specialties as well as gynecology. The intern will spend three months on each of these services.

The second year, six months of which will be spent at the University Hospital, will include two months of obstetrics and gynecology (largely outpatient and demonstration of complicated deliveries); two months of neuropsychiatry (outpatient), and two months of pediatrics, during which time well baby care and infectious diseases will be stressed. The second six months of this man's second year will be spent in the affiliated hospital, where he will again spend three months on each of the two services already mentioned. His responsibility, however, will be increased, and it is presumed that he will be directing the intern on the service who is to follow him.

The residents from the university in medicine and surgery that were mentioned before will be, in effect, supervisors, and will arrange conferences and carry a fair load of the teaching and will be available to evaluate the program day by day as it progresses.

In addition the University Medical School will send one visitor a month in both medicine and surgery to the affiliated hospital. This visitor will be one of the senior faculty members of the Medical and Surgical Department, and he will spend a day at the affiliated hospital. Usually there will be a one hour clinic presented on a subject already decided on; this will probably take the place of one of the weekly clinical conferences. The remainder of the day he will be available for teaching rounds and consultation rounds with the resident and visiting staff.

Until the affiliated hospitals have become approved by the American Medical Association, the interns will be given a certificate by the University Hospital, and it is hoped that, within a reasonable length of time, the service will be so well grounded that approval from the American Medical Association will be forthcoming.

HOW PLAN DEVELOPED

How did this rather unusual plan develop and why was it accepted by the faculty of the medical school that has for years prided itself on intense specialization?

For a number of years, members of the faculty have been becoming more and more aware of the fact that many areas in Michigan (which is predominately a rural state) were not being covered by doctors, and in some cases, large numbers of people have no medical care or else have been subjected to the care of an osteopath. In many areas, older physicians are retiring and no younger men are coming to take over the practice of these elder physicians.

It is the opinion of many of us at the University of Michigan that the ideal practice of medicine is group practice, where a group is composed of a number of physicians especially trained in one particular branch of medicine. This, I believe, is ideal; however, there are many areas where the population density and economic level will not support such a clinic, and it has seemed to some of us that it may be years before this will be practical.

This fact was brought home strongly to me during the past year and a half as I have made visits throughout the state in connection with our program for the training of residents in the various specialties. There seem to be a number of hospitals which wish to put on a teaching program of some sort, whose staff is qualified to teach younger doctors but which could not put on a four year program to train a man as an internist or surgeon. These hospitals tended to be located in areas where there seemed to be a need for general practitioners.

After several of these visits and many discussions with staffs and local practitioners (as I have mentioned), during the fall of 1946, I made an informal survey of some of the senior medical students. This was done in an informal manner by talking to senior students that I was teaching at that time on the medical wards. I kept no definite statistics because it was on such an informal basis that they would have meant little. I did, however, obtain certain impressions which were collaborated by impressions that Dean Furstenberg obtained by talking to the same and other members of the senior class.

Few, if any, of our senior students at that time planned to go into general practice. Undoubtedly some would go into general practice if they were not able to continue their residency training program as they had started, but the important fact in my mind was that no one was starting out with the idea that he would end up in general practice.

It appeared to me from statements that the seniors made that the reason that some of them did not intend to go into general practice was that they felt there was no program where the educational level was equal to that of the medical school from which they were graduating or equal to that of the training programs that led to the specialization.

It was my impression at that time that if a program for the training of general practitioners could be set up so that the senior medical student felt that just as much thought had been given to preparing him to be a general practitioner as to be a surgeon, ophthalmologist or internist, there would be a number of good men who would prefer this type of practice to that of specialization.

A program somewhat different from that which I have outlined was presented to the executive faculty of the University Medical School by the dean around the first of the year 1947. After several discussions and some modifications of the program, it has arrived in the form that it is now, and, as such, has the approval of the Council on Education and Hospitals of the American Medical Association. It has also the approval of the Michigan State Board of Registration in Medicine.

We feel that the program is experimental and have no way of knowing how successful it will be. It will, however, offer training to men who might be interested in general practice.

REASONS FOR THE DESIRE TO SPECIALIZE

I feel that the intense desire to specialize that one sees in the medical student at present has been brought about by a combination of factors. One, undoubtedly, is that in the modern medical school students are taught by specialists and only by specialists. I think particularly the younger group, in which I include myself, has tended to imply that specialization is the only answer to the problems of the modern doctor. And it is the younger men of the Medical School who have the most intimate contact with the students during their stay at the Medical School. It would probably be better if the philosophic lessons which have been learned by the heads of departments were more frequently presented to the students, but it is much easier for the junior and senior students to talk informally with the younger staff men than with those who have achieved the dignity and prestige of departmental head and full professorship. Because of this I feel that the attitude of the younger staff man in the Medical School must be altered to the extent that he realizes that in some places there is need for a general practitioner, and if there is a need for general practitioners, then we must train them correctly.

There has been some talk recently of installing a chair of general practice in the various medical schools. I believe there is an experiment now at the University of Minnesota where there will be a professor of general practice. Most of you, I am sure, are familiar with the Wisconsin experiment, where medical students spend a period of four to six weeks with a practitioner during their senior year.

Another factor which, I think, has influenced medical students is the experiences of their friends during the war. It is common knowledge, I believe, that men with special training received better assignments and faster promotion than other men who might have been just as capable, but who did not have the formal recognition of board or various specialty colleges. I do not feel that any condemnation is implied in this statement, for during the war years it was important that the armed forces sort their reservoir of medical personnel rapidly, and the only arbitrary standard that had been set up at that time was board examinations and membership in the various specialty colleges, and both of these qualifications were dependent to a large extent on the amount of formal training that a person had had.

It seems to me that there has been a constant glorification of the specialist in books, articles and newspapers during the past several years. I can remember, as a medical student, that most of the motion pictures I saw concerning doctors tended to glorify the young man who spent years in developing himself into either a brain surgeon or a great scientist. I often wondered at that time who took care of the patients with heart disease and tonsillitis, but from the ideas I obtained from the motion pictures it would seem that these diseases were not necessarily important, and so doctors needed not be trained to recognize or combat them.

I feel, then, that the faculty problem can be answered in part by having the faculty, which probably should be composed of specialists, explain to the students the procedures and special technics which can be carried out without a large laboratory and a magnificently equipped operating room. I feel that one should place more emphasis on the conditions that can be diagnosed and treated by the general practitioner, at the same time not omitting the diagnostic points of unusual conditions that serve to inform the general physician that here is a case which requires special technic either in diagnosis or therapy and because of this should be referred to a physician who has been trained in a particular field of medicine.

This does not, I believe, conflict with my idea of the ideal practice of medicine. In such a group, the specialist in internal medicine is to some extent in the same position as the general physician in that with the exception of certain diagnostic technics with which he is familiar he refers many patients for special therapeutic procedures and acts as the family physician. Members of the family go to him and depend on him to direct them to the proper specialist if there is need for him.

PROBLEM OF DISTRIBUTION

The distribution problem offers a major obstacle. How are we to see that the man who desires to go into general practice and who has been trained for general practice goes to the place where he is needed? It would seem to me that there are many factors that will affect this problem of drawing young men to rural areas. One, undoubtedly, will be physical equipment that is or is not available to the physician. Should a community equip a doctor's office with the diagnostic facilities that he has been trained to use, or should they finance him during the period of time that he is starting so that he can equip his office and laboratory as he wishes? Is there within a reasonable distance of this rural area, that needs a general practitioner, a modern and up-to-date hospital to which he can send his patients? Should the general practitioner be on the staff of this neighboring hospital? If so, what should he be allowed to do in the way of surgery, obstetrics and medicine? Will there be transportation facilities which will make it easy for his patients to go to the neighboring hospital and, incidentally, easy for him to remain in contact with his patients? What cultural opportunities for the doctor and his family are available in this rural community? What facilities for the education of his children are available for the physician in this rural community? It seems to me that the distribution of general practitioners rests on the ability of communities to sell their area to doctors who want to go into general practice.

In other words: Under the present economic conditions, should there come a time when money in the city is less plentiful than it is at present it would appear reasonable to me that there might be a migration of urban doctors to the rural communities. Our program at Michigan is by no means solified. We are willing to change it as the need arises or as a more practical and useful plan is conceived. We realize that we have merely made a start in answering this question, and I for one feel that if the University of Michigan or any other medical school should eventually develop a general practice training program that (1) builds a desire in the medical student to become a general practitioner; (2) trains the young doctor for this most difficult branch of medicine, and (3) distributes him to the place where he is needed most, then "cleanliness will no longer be next to Godliness."

Clinical Notes, Suggestions and New Instruments

OBTURATOR HERNIA

Report of a Successful Operative Case

HERBERT D. ADAMS, M.D.

and

DELBERT C. SMITH, M.D.
Boston

Herniation of intra-abdominal structures through the obturator foramen in the innominate bone has been recognized as a surgical condition since Arnaud de Ronsil[1] reported the first such incidence before the Royal Academy of Sciences in Paris in 1724. Watson,[2] in 1938, collected 420 cases from the literature. We were able to find only 8 additional cases from Jan. 1, 1938, to July 1, 1946, most of which were single case reports from widely separated sources. Only 1 case occurs in the records of the Lahey Clinic since its inception in 1925. Short[3] reported occurrence of a solitary case at the British Royal Infirmary over a period of a quarter of a century. The condition, however, is probably somewhat more common than this would lead one to believe, since some patients no doubt go through life asymptomatic or with their disease undiagnosed, some die without postmortem examination to establish the cause of death and still others are not reported in the literature. The condition seems sufficiently rare and interesting to warrant the report of such a case in which the patient recently came under our care.

REPORT OF CASE

An unmarried white woman, aged 73 years, was admitted to the New England Baptist Hospital at 5 p. m. on Feb. 13, 1947. The chief complaint was pain in the right lower quadrant of the abdomen. She had been in her usual state of fairly good health until 9:30 a. m. on the day of admission, when, while sitting in a chair reading, she experienced a sudden onset of abdominal pain, which was localized from the beginning low in the right side of the abdomen. At first the pain was mild, but it became progressively more severe throughout the day. It was constant and at no time was it cramplike. A history of radiation of the pain was not obtained. Soon after its onset she became nauseated and vomited several times. At the time of admission the nausea had disappeared, and her only complaint was constant pain in the right lower abdominal quadrant. She had had one normal bowel movement earlier in the morning prior to onset of symptoms.

Systemic review revealed a slight chronic cough in addition to mild orthopnea, moderate dyspnea on exertion and occasional palpitation. She had had a known cardiac condition for nine years and had taken digitalis during most of this time. There had been a total weight loss of 17 pounds (7.7 Kg.) during the previous year.

Physical examination revealed that the patient was slightly dyspneic and acutely ill. Her general appearance was compatible with her stated age, although she was rather thin and there seemed to have been some recent loss of weight. The temperature was 98 F., the pulse rate was 76, regular and of good volume, and respirations were 24. The heart was slightly enlarged but rhythm was regular and sounds were of good quality. *The blood pressure was 150 mm. systolic and 90 mm. diastolic.* Fine rales were present at both lung bases but the chest seemed otherwise normal. There was definite localized tenderness low in the right side of the abdomen with overlying muscle guarding. No rebound tenderness was present. No organs or masses could be felt. Peristalsis was present but hypoactive. Because of a virginal introitus, pelvic examination was not done; pelvic organs, however, felt normal through the rectum. No rectal tenderness was elicited.

From the Lahey Clinic (Department of Surgery, Dr. Adams, and Fellow in Surgery, Dr. Smith).

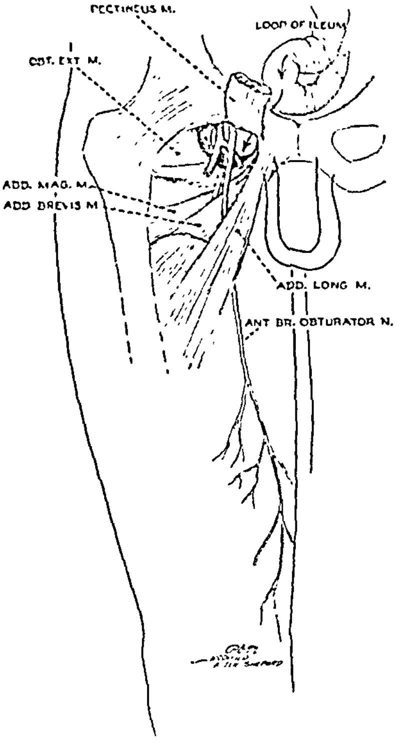
Laboratory studies showed 21,700 leukocytes, and urinalysis revealed no abnormality

A diagnosis was made of acute appendicitis and arteriosclerotic heart disease.

Without further delay, the patient was operated on; a celiotomy was done, pontocaine spinal anesthesia and oxygen being used. A lower abdominal right paramedian incision was used. When the peritoneal cavity was opened a small amount of straw-colored fluid was encountered. The appendix was found to be normal and obviously not the cause of her illness. After both dilated and collapsed loops of small bowel had been visualized, it became apparent that an intestinal obstruction was present. The collapsed portion, beginning at the ileocecal juncture, was traced proximally, and the site of the obstruction found to be in approximately the mid portion of the ileum. This obstruction was caused by a Richter type of herniation of about three fourths of the bowel lumen through a small opening in the right obturator foramen, thus producing partial obstruction at this point. The proximal loop leading into the hernia was at least three times the diameter of the distal loop Gentle traction was applied to both loops, after which the hernia became reduced. Examination of the involved portion of bowel showed it to be decidedly ecchymotic as a result of strangulation. After the application of warm saline sponges, the circulation rapidly improved and viability appeared to be definite. The tip of the small finger could just be inserted through the hernial opening and the sac was no greater than ¾ inch (1.9 cm.) in depth. The hernia was repaired by closing the neck of the sac with a purse string suture of black silk. In view of the extremely small opening, this type of closure seemed adequate. The appendix was removed in the usual manner.



The anatomic relationship in obturator hernia.

Convalescence was uneventful, and the patient was discharged on the twelfth postoperative day.

Further questioning during convalescence revealed that the patient had had several attacks of pain in the right lower quadrant of the abdomen during the preceding seven years. Associated with each attack had been a tendency for the right leg to flex at the hip. She also recalled that she had had a similar episode on the morning prior to admission with a tendency for the leg to flex at the hip, and had been unable to straighten the leg or stand on it. Later in the day, while she was in bed, the leg relaxed, and because of the predominance of the pain in the right lower quadrant she had forgotten about the symptoms referable to the extremity. She did not recall having had actual pain in the leg but stated that it felt like a muscular cramp.

When interviewed on August 2, 1947, she was well and no further attacks had occurred.

COMMENT

In retrospect, this case is typical of those previously reported in the literature, and had we been more astute in obtaining a complete history, the correct diagnosis might have been made preoperatively. The previous symptoms referable to the leg were in all probability associated with episodes of strangulation or incarceration of the hernia which each time, until the day of admission, had reduced itself. Fortunately, her condition was recognized as a surgical emergency and was treated as such before the bowel became gangrenous or her general condition began to fail. Watson stated that of 228 patients treated surgically or on whom an autopsy was performed after death from strangulation, only 53 received a correct diagnosis preoperatively or ante mortem. the obturator canal, which passes downward, medialward and forward in the upper inner aspect of the thigh. The hernia comes to lie just anterior to the external obturator muscle and immediately behind the pectineus and adductor longus muscles. Reference to the figure will show this important relationship. Being tightly enclosed in muscle and fascia deep in the thigh, this type of hernia frequently does not produce a noticeable or palpable mass, which often calls attention to the presence of a hernia elsewhere in the body. This anatomic reason alone makes the diagnosis of an obturator hernia difficult.

Structures normally passing through the obturator canal are the obturator artery, vein and nerve. A fat deposit is usually present and a small lipoma is not infrequently found.[4] When hernia is present in the canal it encroaches on the already limited space occupied by these structures and produces the exciting cause for pain or paresthesias over the distribution of the anterior branch of the obturator nerve. This symptom was first described by Howship in 1840 and five years later by Romberg. It is now known as the Howship-Romberg sign. Watson stated that it is present in over 50 per cent of the cases. Reference again to the figure will show the distribution of the anterior branch of the obturator nerve going as far as the medial aspect of the knee. Symptoms referable to this nerve distribution area are probably the most valuable aid in making the diagnosis of an obturator hernia. The anastomotic plexuses to areas supplied by the obturator artery are so abundant that circulatory disturbances do not occur even if the blood flow is completely obliterated, as it probably is in many cases in which strangulation is present.

Since the most common content of the sac of an obturator hernia is small bowel, the presenting symptom is frequently that of intestinal obstruction. The degree of obstruction will, of course, depend on the percentage of bowel lumen involved. Usually the sac is small, admitting only a portion of the diameter of the bowel, with a resulting Richter type hernia. Such was true in the case reported, only a partial obstruction being present. Because of the extremely small, rigid sac neck, strangulation occurs early. Constant, localized pain resulting from the strangulation may be severe enough to overshadow referred pain resulting from pressure on the obturator nerve. Instances in which the sac contained bladder and fallopian tube,[5] Meckel's diverticulum,[6] infected fallopian tube with abscess formation[7] and omentum[8] have been reported. The cecum and appendix appear to be even rarer contents.

To aid further in the diagnosis, a careful search should be made in the upper inner aspect of the thigh for a palpable mass or localized tenderness. A mass, however, will seldom be demonstrable because of the anatomic relationships already described. Tenderness high in the thigh can be expected in a fairly large number of the cases.

[8] Stirling, R. A.: Strangulated Obturator Hernia, M. J Australia 1:519 (June 25) 1921.

It will be recalled that the adductor longus, obturator externus and pectineus muscles act essentially as adductors, flexors and external rotators of the thigh. Visualizing the strangulated hernia mass caught between the obturator externus posteriorly and the adductor longus and pectineus anteriorly, one can readily understand why these patients will assume the position of flexion of the thigh. Extension, abduction and internal rotation of the thigh will place the muscles on the stretch and thus intensify the pain by increasing pressure on the sac.

Finally, the demonstration of a tender mass on the anterior pelvic wall by vaginal or rectal examination may help to verify the diagnosis.

Many causes have been proposed for obturator hernia. No doubt the passage of the vessels and nerve through the foramen create a potential weakness or defect for the beginning formation of a sac. Chronic pulmonary disease with cough and intermittently increased intra-abdominal pressure may be a contributing cause. Obturator hernias occur more frequently in women than in men (6 to 1 in Watson's series), probably as a result of the relatively larger size of the foramen in the former. Loss of [illegible], pregnancy and shrinkage of tissues with advancing age [illegible] to be important factors. The hernias occur with approxi[illegible] the same frequency on the right and the left side.

The treatment of obturator hernia is surgical. An approach through the thigh has been advocated by some authors in the past, but this method seems unwise, especially since the diagnosis frequently is uncertain and because of the limited exposure afforded by such a route. Gangrenous sac contents, if encountered, cannot be adequately dealt with from below. In order to manage any condition found, an adequate paramedian or rectus incision in the lower part of the abdomen, corresponding to the side of localization of symptoms, is recommended. Placing the patient in Trendelenburg position may be of considerable aid in reducing the hernia as well as in keeping the remaining bowel out of the pelvis when exposure is essential. Pressure applied over the hernial mass in the upper part of the thigh will help when traction alone from above has failed at reduction. The sac contents should be examined carefully and the state of viability determined. If irreversible damage has occurred, an appropriate resection will be necessary. The passage of a Miller-Abbott tube through the pylorus while it can be guided in the open abdomen is strongly urged in those cases in which resection of the intestine is done.

Methods of dealing with the sac and obturator defect are numerous. Simple purse string closure may be adequate for extremely small openings. Suture of the sac to the parietal peritoneum after pulling the apex through the foramen has been suggested.[9] Wakeley[6] has advocated ligation of the sac and suture of a strip of the innermost fibers of the pectineus muscle, which has been raised through an incision in the groin, to the periosteum above the obturator canal. Short[3] reported the use of a piece of rib cartilage to fill the obturator canal. Cartilage needs but little blood supply and readily forms a mass of scar tissue which blocks the passage of a future hernia. Van Zwalenburg[10] reported a case in which death occurred from strangulation and obstruction eight years after repair by inversion of the sac and simple suture. The general condition of the patient, the size of the hernia and extent of resection, if necessary, must be taken into consideration, and good surgical judgment must be exercised in selecting the procedure with which to repair the defect in each instance.

SUMMARY

A successful operative case of obturator hernia is presented. The condition, although rare, must be kept in mind and, in the presence of strangulation and obstruction, recognized early as a surgical emergency if a fatality is to be avoided. The diagnosis is suggested by the history or presence of pain, or both, along the course of the obturator nerve (Howship-Romberg sign), the demonstration of a mass or tenderness or both in the upper inner aspect of the thigh and the possible presence of a mass on the anterior pelvic wall which can be felt by bimanual examination. The treatment is surgical through an adequate abdominal incision. The type of repair will depend on the general condition of the patient, the size of the hernia and the extent of injury to the sac contents.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

The Council has authorized publication of the following report.

Austin Smith, M.D., *Secretary.*

"MANOGIN"—ANOTHER "BUST DEVELOPER"

Vanity is responsible for the sale of a variety of products which may momentarily satisfy the purchaser but eventually prove downright harmful. Among the more widely exploited substances have been the so-called "bust developers." Enterprising promoters have duped the public into buying some doubtful preparations. The ingenuity shown in exploiting the desire for sexual attraction reveals considerable imagination. The purchaser, however, is not always simply relieved of money for a useless article; too often harm has resulted from the sale. In some instances the users are so intent on success that repeated failures may mean for them definite psychologic disturbances. If the product possesses harmful possibilities, the result may be disastrous.

During the past few months the Bureau of Investigation and the Council on Pharmacy and Chemistry have received numerous inquiries about an alleged "bust developer" that contains materials with estrogenic activity, the so-called female sex hormones. This product, "manogin," distributed by the Manogin Company, 880 Bergen Avenue, Jersey City 6, N.J., has been promoted in part by the circulation of a booklet entitled "Thank You Doctors," on the title page of which is a list of physicians known for their scientific investigations. On glancing at the booklet the casual reader receives the impression that these scientists were personally interested in the study of "manogin." As might be expected, however, they had no such interest; in fact, inquiry from the Council office found much indignation among these men because their names had been thus used. Typical of the comments offered by the physicians are the following: "I have not, at any time, participated in a study of the topical application of estrogens or made any contribution to the literature on this subject. In fact, I do not believe that this is a rational or safe procedure, and since I disapprove of it, have never prescribed estrogens for this purpose in my entire medical experience." Another writes: "I should like to emphatically state that I have done no investigative work whatever on the topical application of estrogens (particularly to secure enlargement of the female bust)....Finally, the use of my name in their advertisement has never been authorized by me."

And another states: "Early in the days of stilbestrol therapy I believe that I administered an ointment by inunction in 1 case, which, under control, failed to respond....Because of the fact that I do not wish my name associated with an advertising circular, I have transferred the matter to our legal staff."

Another reply was: "I was amazed and not a little surprised to find my name on a plate which looks like a memorial to the dead....Their use of my name has been without my knowledge, as they undoubtedly knew better than to ask my permission to use it....I have had no occasion to use estrogenic creams, even experimentally."

Of interest is the following comment: "It is perfectly obvious from the very introductory paragraph that the Manogin Company has used the name of perfectly honest investigators for a fairly dishonest purpose. I, for instance, have written on the estrogen in dysmenorrhea and in the menopausal syndrome. But I have never proposed its used by inunction for any purpose, certainly not as a stimulant to mammary growth."

This writer further states: "The application of estrogen directly to the breast in the form of inunctions has proved a total failure in the experience of the authors."

Nevertheless, as might be expected, the booklet aroused some interest. One inquirer wrote: "Enclosed you will find an advertisement sent to me through the mail. I don't know how they ever sent it to me or how they found my address. but it so happens that I could probably use or need such a product."

A doctor stated: "The enclosed pamphlet of the Manogin Company speaks for itself, and it is being distributed widely to high school students and women in this area."

A college student wanted to know: "Is this Manogin Company in Jersey City a fraud, or has it put out honest information as a result of hard work of credited scientists and doctors?"

Unfortunate indeed is circulation of the pamphlet among high school and college-aged young women. These people will read, among other things, that "careful observation of the progress in thousands of cases has given definite evidence of rapid breast growth from the use of the natural hormone formula as found in Manogin. It is a safe, harmless and effective method which leaves no ill or toxic effects."

That a product of this type is not without harmful possibilities is emphasized by several reports. In his article, "The Relationship of Hormones to Disease of the Breast,"[2] Dr. Ira T. Nathanson has reported:

> "Quoting the case of Auchincloss and Haagensen,[1] the effect of the estrogens seemed to resemble that seen in the mouse, and was of an unusual histologic type. They have cautioned against indiscriminate use of the hormone over a long period of time or in large doses. when there is a family history of cancer, without initial and repeated examination of both breasts, and in patients with chronic mastitis, cancer or any form of neoplasm either before or after surgical treatment. Such advice is valuable and should be considered by all those who use the hormones."

Estrogen therapy in the treatment of mammary cancer has been found to be definitely contraindicated in any patient who still menstruates or has menstruated within a five year period.[3]

Some endocrinologists have warned that the use of such ointments might affect the normal body functions—for example, the menstrual cycle—if much of the hormone is absorbed through the skin. Likewise, the premature development of adult female secondary sex characteristics may be undesirable in young girls otherwise unprepared for maturity. Self medication with female sex hormones for stimulation of growth of the breast is likely, also, to discourage a search for other evidences of infantilism in young girls who may be in need of medical supervision.

While it is true that growth of the breast might be stimulated by the use of estrogenic materials, such development is temporary only, and a return to normal size occurs immediately on cessation of treatment. The method of application involves a certain amount of risk and, if adopted at all, most definitely should be used only in cases which, on examination, are found to be due to ovarian insufficiency. Obviously undeveloped breasts not due to deficiency of the female sex hormone cannot be caused to develop by the use of such medication. There is seldom a rational therapeutic indication for the use of an ointment containing an estrogenic substance and certainly such ointments should be used with caution and only under the observation of a competent physician.

Firms that play on emotional appeal and encourage wishful thinking in the promiscuous use of drug preparations are not interested in scientific advancement; their interest is solely financial. When they resort to muddling the reader with pseudoscientific verbiage, especially when it is directed to those who are not properly informed concerning the use of the exploited preparations, they cannot be condemned too strongly. Unfortunately long periods may elapse before these promoters can be brought before governmental authority. In the meantime many women will waste their money, disturb their physiologic functions, become mentally distressed or otherwise damaged by believing the false promises of these unprincipled exploiters of feminine credulity.

The offices of the American Medical Association have for years provided inquirers with the facts regarding medical products. Questions concerning exploited preparations are always welcome and will be answered promptly without charge for the service.

DIHYDROXY ALUMINUM AMINOACETATE GENERIC TERM FOR "ALGLYN," "ALMINATE" AND "ASPOGEN"

Under the protective names "alglyn," "alminate" and "aspogen," Brayten Pharmaceutical Company, Bristol Laboratories, Inc. and Eaton Laboratories, Inc., respectively, submitted for the Council's consideration a basic aluminum salt of glycine containing small amounts of aluminum hydroxide and glycine. The agent is designed for use as a gastric antacid. The Council has recognized the name dihydroxy aluminum aminoacetate as a generic designation for this compound.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following article. HOWARD A. CARTER, *Secretary.*

INFELD PROGRESSIVE HEEL-CORD STRETCHER ACCEPTABLE

The Infeld Progressive Heel-Cord Stretcher is designed for use by the orthopedist to give systematic exercise to a patient with shortened tendo calcaneus. In operating the device, the foot is placed on a pedal that is free to move in such a way as to involve flexion and extension of the ankle joint only. Resistance is supplied by coiled springs. Wedges that can be placed under the foot make it possible to determine the initial and final position of the foot during each movement. The exercise will bring into play mainly the tibialis anterior in dorsiflexion and the triceps surae in plantar flexion; by proper use, a stretching force can be applied to the tendo calcaneus.

In using the apparatus the patient stands with his sound foot on a box or platform that is on a level with the pedal. The apparatus stands on a base measuring 56 by 53 cm. (22 by 21 inches). The uprights offer hand grips by which the patient may steady himself; these can be adjusted to heights between 54 and 86 cm. (21½ and 34 inches) above the floor.

The device was sent to an orthopedic surgeon for clinical trial. On the basis of constant use in his office for a period of several weeks he reported that it was well made, easy to use and effective. He recommended that the apparatus be used without a stool, so that the patient stands on the floor. The manufacturer states that this apparatus is to be used only under the direction of an orthopedic physician in charge of each individual case.

The Council on Physical Medicine voted to include the Infeld Progressive Heel-Cord Stretcher in its list of accepted devices.

EDITORIAL ANNOUNCEMENT

The compositors returned to work on Monday, June 28. This issue of The Journal has been prepared in part by the use of Vari-Typer machines.

SURGICAL TREATMENT OF SEVERE ANGINA PECTORIS

Surgical treatment of angina pectoris, say White and Bland,[1] should be reserved for patients who, after adequate observation, cannot be controlled effectively by medical means. In such patients surgical intervention may prolong life by the relief of pain during a particularly dangerous period of coronary insufficiency until collateral circulation of the myocardium improves. Such patients must choose between continued dependence on drugs with limitation of activity and the more dangerous method of relieving pain by surgical intervention with possibly more rewarding effects. The surgical procedures proposed for amelioration of the anginal pain are (1) total thyroidectomy, proposed by Blumgart, Levine and Berlin; (2) grafting of an intercostal muscle to the myocardium as advocated by Beck; (3) O'Shaughnessy's operation of grafting omental graft to the myocardium, and (4) sensory denervation of the heart. The most encouraging results thus far have followed surgical intervention either on the upper thoracic paravertebral ganglions or on the corresponding posterior spinal roots which carry pain-transmitting fibers from the heart.

The sympathetic innervation of the heart was believed until recently to be mediated solely through the superior, middle and inferior sympathetic cardiac nerves, which arise from the superior, middle and inferior cervical sympathetic ganglions, respectively. Kuntz and Morehouse[2] demonstrated in adult cadavers the existence of cardiac accelerator nerves arising from thoracic segments of the sympathetic trunks. Clinical and experimental data suggest that the cardiac nerves that arise from ganglions of the sympathetic trunk below the inferior cervical ganglion convey both sympathetic and visceral afferent fibers.

Anatomic studies by Jonesco and Enachesco[3] demonstrated the existence of thoracic cardiac nerves. They were found to be constant and usually to occur bilaterally. These anatomic studies suggested that all afferent painful impulses are carried to the paravertebral sympathetic chain either over the middle and inferior cardiac nerves or over accessory cardiac rami which run to the upper three thoracic ganglions. As there are no direct connections between the cervical ganglions and the spinal cord in the neck, these pathways are all concentrated in the upper part of the thorax, where they reach the highest three or four thoracic spinal nerves over the sympathetic rami communicantes.

Francois-Franck first suggested, in 1899, the possibility of relieving the coronary pain by interruption of afferent pathways during their course in the sympathetic trunk and ganglions, and Jonesco and Enachesco apparently did the first operation of this type in 1916. Mandl reported 16 cases in which he injected procaine, 0.5 per cent, paravertebrally. The duration of the relief in his patients persisted for a long time and there were no deaths or any severe complications. Swetlow[4] pointed out that even if the entire cervical sympathetic cord and the stellate ganglion are removed, the lowest of these fibers will not be interrupted. The chief communications between the cervicodorsal sympathetic chain and the spinal cord are through the rami communicantes of the upper thoracic nerves. Swetlow treated eight patients suffering from severe precordial pain by paravertebral alcohol injections into the dorsal root ganglions and obtained prompt relief from pain in every instance. Lindgren and Clivecrona[5] treated 71 patients with severe cardiac pain by resection of the stellate and the 4 upper thoracic ganglions with gratifying results. The operation gave complete relief from pain in 44 per cent of patients, and in 41 per cent it converted severe forms of angina pectoris into milder types. The sensation of fear connected with the pain disappeared in many patients. On emotion or exercise all patients postoperatively experienced a choking sensation or slight pain which served as a "warning signal."

[5] Lindgren, I., and Olivecrona, H.: Surgical Treatment of Angina Pectoris, J. Neurosurg. 4:19-39 (Jan.) 1947.

The choice of the proper surgical procedure depends on the relative competency of the heart. White and Bland[1] are of the opinion that patients with a fair cardiac reserve may be subjected to a laminectomy and root section. This operation is indicated when the reference of the pain is bilateral. For the more questionable risks thoracic ganglionectomy is preferred, especially if the anginal pain is unilateral. For the poorest risks, patients who have had repeated attacks of coronary thrombosis with large hearts and great reduction in cardiac reserve, interruption of the nerves by paravertebral alcohol block is advised. White and Bland report on 75 patients treated at Massachusetts General Hospital by paravertebral injection with alcohol. Of these, 56 per cent were completely or nearly completely relieved of their pain on the side of injection; 21.3 per cent had fair results. Eight per cent failed to derive adequate relief and 8 per cent died as a direct result of the procedure. This group included the worst risk cases with severe coronary disease. In 8 cases the upper thoracic ganglionectomy was followed by complete relief of pain in the precordium and arm on the denervated side.

Surgical intervention should probably be considered more often when an adequate medical regimen fails to control severe and prolonged anginal pain.

A CONCEPT OF PATHOGENESIS OF ESSENTIAL HYPERTENSION

Heinbecker[1] presented evidence that a humoral mechanism rather than overfunction of the sympathetic nervous system is the primary cause of essential hypertension. The concept is based on studies of the Cushing syndrome in man and the hypothalamicohypophysial relationships in the dog. The essential characteristics of the circulation in Cushing's syndrome are similar to those observed in essential hypertension. In both states diastolic hypertension and arteriolar sclerosis develop. Cushing in 1932 described a pluriglandular syndrome which, he believed, was always caused by a basophil adenoma. The syndrome, Heinbecker[2] indicated, may be caused by an adrenal cortical tumor, by tumor of the ovary or a tumor of the thymus.

Crooke[3] in 1935 described a histologic alteration in the basophil cells of the hypophysis in Cushing's syndrome which he characterized as degranulation or hyalinization. Heinbecker[4] found a well.defined hyalinization of the basophilic cells of the hypophysis in all of the 5 instances of Cushing's syndrome reported by him in 1944. In 4, definite changes were noticed in the hypothalamic nuclei, particularly in the paraventricular nuclei. In none of these 4 was an adrenal tumor present. In the fifth case, in which a malignant adrenal tumor was found at necropsy, a hypothalamic lesion was not found. Therefore, either an adrenal tumor or hypofunction of the paraventricular hypothalamic nuclei may be the primary cause of the basophil degeneration, which in turn is the immediate cause of many of the typical findings in the Cushing syndrome.

Heinbecker denervated the neural hypophysis in dogs through the oral approach, separating it from the supraoptic and paraventricular nuclei. Within three to five months a loss of the basophilic cells in the glandular hypophysis and a preponderance of eosinophilic cells occurred. Depression of the function of the hypothalamic nuclei apparently results in a diminution in the secretion of the neural hypophysis. One consequence of this is to cause a stimulation of the eosinophilic cells of the glandular hypophysis, which are known to exercise a trophic effect on the heart, the renal tubules and the suprarenal gland. Another effect is to sensitize the blood vessels to the constricting action of epinephrine, of desoxycorticosterone and of renin. Overaction of the desoxycorticosterone fraction of the suprarenal cortical hormone effects a constriction of the efferent glomerular arterioles of the kidney and thereby leads to release of renin. Heinbecker assumed that the combined action of all three substances is responsible principally for generalized arteriolar narrowing and the development of diastolic hypertension in both Cushing's syndrome and the essential hypertension.

---

[2] Heinbecker, P.: The Pathogenesis of Cushing's Syndrome, Medicine 23:225 (Sept.) 1944.

[3] Crooke, A. C.: Change in Basophil Cells of Pituitary Gland Common to Conditions Which Exhibit Syndrome Attributed to Basophil Adenoma, J. Path. & Bact. 41:339 (Sept.) 1935.

[4] Heinbecker, P.: Cushing's Syndrome, Ann. Surg. 124:252, 1946.

Heinbecker postulated that functional influences in the central nervous system, particularly in the frontal lobes of the cerebral cortex, in those constitutionally susceptible, may be of sufficient degree to depress the hypothalamic nuclei, which control the neural hypophysis, to initiate changes in the glandular hypophysis and thereby to influence other endocrine glands to cause the diastolic hypertension called "essential" with characteristics similar to those observed in Cushing's syndrome, but without the development of all the other stigmas of the syndrome.

The concept of pathogenesis of essential hypertension offered by Heinbecker is in accord with the accepted importance of emotional influences in its development.

The role of the sympathetic nervous system and of epinephrine is regarded as a mechanism for rapid homeostatic adjustments of the renal circulation, rather than of primary importance in pathogenesis of such hypertension..

Current Comment

METABOLIC FATE OF GLYCOGENIC SUBSTANCES

The major dietary constituents and metabolic intermediates were originally classed as glycogenic or as ketogenic, largely on the basis of whether or not they were excreted as glucose when administered to a phlorhizinized animal. When lactic acid was administered to such an animal, it was recovered almost quantitatively as extra urinary glucose. This was interpreted to mean that the carbon atoms in lactic acid were changed to glucose and excreted as such. Recent investigation has shown, however, that although an equivalent amount of glucose is excreted, most of the carbon atoms are not the same carbon atoms administered as lactate.[1] Of the radioactive labeled carbon atoms present in lactate, only about one fourth appeared in urinary glucose and about one half was found present in fat and urinary ketone bodies. The experiments emphasize again the equilibrium nature of the chemical reactions which occur in the body. The carbon atoms of lactic acid or its intermediates appear to be exchanged for the carbon atoms found in other substances, resulting in the formation of an equivalent amount of glucose in which the carbon atoms are not necessarily those present in the administered lactate.

WASHINGTON LETTERS

In a regular column which appears in the *Rocky Mountain Medical Journal*, Delegate William H. Halley calls attention to the various communications offered for sale to the medical profession from Washington which purport to keep the medical profession informed concerning the Washington scene. In addition there are several communications which come as the result of services established through medical organizations. Doctor Halley says, and most critical readers will agree with him: "One authoritative and exhaustive weekly or biweekly report would furnish welcome relief." The reports now available include a letter circulated by Dr. Joseph S. Lawrence, who is the representative of the Council on Medical Service of the American Medical Association, a letter circulated by Dr. Marjorie Shearon, one issued by Gerald Gross called "Washington Report," a letter published weekly in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and occasional items from other organizations which maintain Washington offices. Of the material thus far available the communication by Mr. Gross is the most complete, most accurate and most unbiased. Dr. Lawrence's letter is almost wholly concerned with medical legislation. Dr. Shearon's letter is lively but constantly colored by her personal point of view. The letter thus far published in THE JOURNAL is in process of improvement, and it is hoped that it may serve satisfactorily the needs of the medical profession generally in this regard.

ABOUT THE CAROTID SINUS

In man the carotid sinus is a bulbous enlargement of the first part of the internal carotid artery and of the terminal part of the common carotid. In the wall of the sinus is a dense plexus of nerves and sensory structures which have important regulating functions and react to various stimuli. In abnormally sensitive persons stimulation of the carotid sinus may cause vertigo, syncope and even convulsions, as well as much milder manifestations—the carotid sinus syndrome of Weiss and Baker.[1] Syncopal attacks may be caused by pressure on the region of the sinus.[2] Dangerous sinus reactions may occur during surgical operations, especially on the neck, and no doubt death, attributed often to circulatory failure, may result. In severe and incapacitating cases which resist proper medical treatment denervation of the sinus by section of the carotid sinus nerve and stripping of the carotid arteries have given complete relief.[3] In a case of carotid body tumor associated with carotid sinus syndrome cure followed removal of the tumor with stripping of the carotids.[4] In only 6 of 196 carotid tumors reported in the literature is it mentioned that pressure on the tumor caused syndromal symptoms. There seems to be no other relation between the carotid sinus and carotid tumor than that of contiguity.

ORGANIZATION SECTION

PROCEEDINGS OF THE CHICAGO SESSION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN CHICAGO, JUNE 21-25, 1948

HOUSE OF DELEGATES

Monday Afternoon—Continued

Resolution on Cancellation of Blue Cross

Dr. H. B. Goodrich, Missouri, presented the following resolution, which was referred to the Reference Committee on Medical Service and Prepayment Insurance:

Whereas, The American Medical Association on many occasions has encouraged the formation of nonprofit voluntary prepayment hospitalization and medical service plans by its constituent state and county societies; and

Whereas, These constituent state and county societies have participated in the formation and development of nonprofit voluntary hospitalization programs (nationally known as Blue Cross hospitalization plans) and nonprofit medical surgical service programs (nationally known as Blue Shield plans); and

Whereas, The action of the American Medical Association in cancelling its contract with the Chicago Blue Cross and Blue Shield plans which provided hospitalization and medical surgical coverage for the employees of the American Medical Association and in contracting with a commercial insurance company for the same coverage was not in the best interest of the medical profession as a whole or the voluntary Blue Cross and Blue Shield plans; and

Whereas, This action of the American Medical Association has already by adverse publicity caused serious embarrassment to the Blue Cross and Blue Shield plans; therefore be it

Resolved, That the House of Delegates of the American Medical Association instruct its Board of Trustees immediately to cancel the contract with the commercial insurance company and reinstate the contract with the Blue Cross and Blue Shield plans.

Resolution Approving Cancellation of Blue Cross

Dr. H. A. Lawson, in behalf of the Rhode Island Medical Society, presented the following resolution, which was referred to the Reference Committee on Medical Service and Prepayment Insurance:

Whereas, The General Manager and the Board of Trustees of the American Medical Association, acting in the best interests of the employees of the Association, have provided for them a plan of prepaid hospital and medical care insurance on a group basis, sharing with the employees the cost of such insurance; and

Whereas, This action has been unjustly and unfairly criticized by many nonprofit hospital and medical care organizations, and even by some medical societies, because the insuring company is not organized wholly for nonprofit; and

Whereas, The insurance jointly purchased by the Association and its employees provides more benefits at a lower cost than obtainable through a nonprofit plan; and

Whereas, Competition in free enterprise is one of the bulwarks of American economic freedom; therefore be it

Resolved, That the Rhode Island Medical Society express its approval of the sound action taken by the General Manager and the Board of Trustees of the American Medical Association in this matter, and express its disapproval of the unwarranted resolutions and actions directed against the aforesaid officers in this instance.

Resolution on Discrimination Against Insurance Industry of This Country

Dr. H. A. Lawson, in behalf of the Rhode Island Medical Society, presented the following resolution, which was referred to the Reference Committee on Medical Service and Prepayment Insurance:

Whereas, The Rhode Island Medical Society has sponsored a prepaid, voluntary surgical-obstetrical insurance plan under which all insurance companies licensed in Rhode Island, including the Hospital Service Corporation (Blue Cross) of Rhode Island, may equally participate; and

Whereas, All policies under the Rhode Island Plan are subject to the approval of the Rhode Island Medical Society and can be sold only with such approval; and

Whereas, As of this date, May 5, 1948, thirteen major insurance companies, profit and nonprofit, including the Metropolitan Life Insurance Company, have submitted policies for approval by the Rhode Island Medical Society; and

Whereas, Some of these great insurance companies are already selling policies under the plan, and at premium rates comparable to the so-called nonprofit plans in other parts of the country, and in many instances with wider coverage; and

Whereas, The Rhode Island Medical Society has been informed that *the Council on Medical Service of the American Medical Association* has established a policy to require a one year period of operation for plans underwritten by private insurance carriers before such plans are formally considered for receiving its seal of acceptance; therefore be it

Resolved, That the Rhode Island Medical Society request that the House of Delegates of the American Medical Association discourage such discriminatory regulations as regards plans sponsored and approved by state or county medical societies as being contrary to the purposes for which the Council on Medical Service was established, as being unfair to the insurance industry of this country which the Council on Medical Service itself, at the Cleveland Session this year, reported has insured an estimated 44,000,000 persons under health and accident coverage, and as being a penalty to the state or county medical society that does not endorse the nonprofit program exclusively.

Resolution on Compulsory Cash Sickness Compensation

Dr. H. A. Lawson, on behalf of the Rhode Island Medical Society, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

Whereas, The House of Delegates of the American Medical Association in meeting at San Francisco in July 1946 adopted a resolution presented by the Rhode Island Medical Society which requested that the American Medical Association, through the proper Council or Bureau, make a complete study of the existing and proposed compulsory temporary disability compensation programs, such as the compulsory Rhode Island Cash Sickness Compensation plan, and that a report of the findings of such a study, particularly as regards the medical phases of the programs, be submitted to each of the constituent state medical societies before January 1947; and

Whereas, Such a complete study report has never been made to the state medical societies in accordance with this action of the House of Delegates; and

Whereas, Such a study is now being made under the sponsorship of the National Physicians Committee; therefore be it

Resolved, That the Rhode Island Medical Society, being well aware of the far reaching effects of a program of compulsory cash sickness compensation, express its dissatisfaction that the study it requested of the American Medical Association has not been made, and is now being undertaken by an organization neither authorized nor qualified to speak for the American medical profession.

Resolution on Change in Constitution

A delegate, in behalf of the Medical Society of the State of New York, presented by title a resolution requesting a change in the Constitution, which was referred to the Reference Committee on Executive Session.

Resolutions on Hospital and Medical Care for Veterans

Dr. Harry Aranow, in behalf of the Medical Society of the State of New York, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

Whereas, The American Medical Association believes that veterans who have been injured or disabled in the service of their country are entitled to the highest type of medical and hospital care; and

Whereas, Point Seven of The Ten Point National Health Program of the American Medical Association on "Veterans Need for Hospital and Medical Care" reads:

"A program for national health should include the administration of medical care, including hospitalization, to *all* veterans, such medical care to be provided preferably by a physician of the veteran's choice, with payment by the Veterans Administration through a plan mutually agreed upon between the state medical association and the Veterans Administration"; and

WHEREAS, No differentiation is made in the aforementioned program between veterans suffering from illness or disabilities incurred in or aggravated by military services and those veterans suffering from illness or disabilities not incurred in or aggravated by military service; and

WHEREAS, The present policy of the Veterans Administration is to furnish medical care and hospitalization to veterans whose illness and disabilities were not incurred in or aggravated by military services only when such veterans are not able to "pay the necessary expense of hospital care" and ". . . a bed is available in an existing facility"; and

WHEREAS, The Veterans Administration has neither the legal right nor the administrative machinery to investigate affidavits on financial ability of such persons with non-service-connected disabilities ". . . to pay the necessary expense of hospital care"; and

WHEREAS, Nearly two-thirds of the beds in Veterans Administration hospitals are now filled with patients with non-service-connected disabilities; and

WHEREAS, The Veterans Administration now has 126 hospitals at a cost of over one billion dollars; and

WHEREAS, The Veterans Administration currently has over 5,000 beds closed because of inability to obtain personnel without lowering the standards of medical care; and

WHEREAS, The unlimited expansion of Veterans Administration hospitals will lead to an inferior grade of medical and hospital care for veterans and at the same time injure the quality of hospital service that is available for the entire population by draining professional and technical personnel away from hospitals which serve the public as a whole; be it

Resolved, That Point Seven of the Ten Point National Health Program of the American Medical Association on "Veterans' Need for Hospital and Medical Care" be changed to read:

> "A program for national health should include the administration of medical care, including hospitalization, to all veterans currently entitled to such medical care and hospitalization under existing federal statutes, such medical care to be provided preferably by a physician of the veterans' choice with payment by the Veterans Administration through a plan mutually agreed on between the state medical association and the Veterans Administration"; and be it further

Resolved, That this House of Delegates of the American Medical Association is in favor of congressional action to interpret the following requirements of admission of persons with non-service-connected disabilities to Veterans Administration hospitals:

1. The ability ". . . to pay the necessary expense of hospital care"
2. " . . . *if a bed is available in an existing facility*"; and be it further

Resolved, That this House of Delegates of the American Medical Association goes on record as favoring a definite ceiling on the number of beds to be provided in Veterans Administration hospitals, and that such a ceiling be placed at 140,000 beds, the number already authorized by Congress."

Resolutions on Editorials in The Journal of the American Medical Association

Dr. Wyman D. Barrett, Michigan, introduced without reading, Resolutions on Editorials in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, which were referred to the Reference Committee on Executive Session.

Resolutions on Federal Grants-in-Aid to States

Dr. J. Wallace Hurff, on behalf of the Medical Society of New Jersey, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The American Medical Association has repeatedly expressed its adherence to the principle that federal grants-in-aid for medical and health services should be made available only to those states which can demonstrate a definite need for federal financial assistance; and

WHEREAS, Despite this declaration of principle, the American Medical Association has supported legislation—notably the Hospital Survey and Construction Act and the pending Taft-Smith-Ball-Donnell Bill—in which federal grants-in-aid are or would be made available to all states, regardless of their actual need for federal asistance; and

WHEREAS, The extension of grants-in-aid to the states is inevitably accompanied by federal restrictions and interference in the affairs of the several sovereign states, and accelerates the tendency toward centralized bureaucratic authority over the affairs of local communities and of individual citizens; therefore be it

Resolved, By the House of Delegates of the American Medical Association that it hereby strongly reiterates its opposition to the extension of federal grants-in-aid to any state for any health or medical service except where such state has clearly demonstrated an absolute need for such federal asistance; and be it further

Resolved, That the Board of Trustees of the American Medical Association be directed to withdraw and withhold the consent and approval of the American Medical Association from any legislation, pending or hereafter proposed, unless this principle is embodied in such legislation.

Resolutions on Bacteriologic Warfare

Dr. J. Wallace Hurff, on behalf of the Medical Society of New Jersey, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The use of biologic and bacteriologic methods of warfare is inhumane, subjecting great numbers of noncombatant people to its jeopardy; therefore be it

Resolved, By the House of Delegates of the American Medical Association that bacteriologic and biologic warfare be condemned as essentially inhuman and inhumane; and be it further

Resolved, That such technics of warfare should be specifically outlawed by international covenant.

Resolution on Endorsement of Blood Banking Agencies and Associations

Dr. James P. Kerby, for the Utah State Medical Association, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The American Medical Association is aware of the dangers, technicalities and complexities involved in the procurement and processing and transfusion of blood, including such problems as various transfusion incompatibilities due to the known antigenic complexities of human blood, the danger of transferring virus diseases, particularly homologous serum jaundice and the possible spreading of malaria, syphilis and various other serious infectious diseases, all of which are a part of blood banking; and

WHEREAS, These problems require handling by competent persons under the responsible control of local independent nonprofit institutions, sponsored by organized medicine as represented by state and county medical societies; and

WHEREAS, Blood banking is a highly specialized branch of medicine, requiring that related scientific services follow the blood and that the blood bank maintain a close relationship with both patient and physician; and

WHEREAS, Blood banking is a community function necessary for and maintained by the local medical profession and hospitals of a community; and

WHEREAS, Blood banking cannot exist without medical and related scientific consultations; and

WHEREAS, It has been brought to the attention of this Association that on Nov. 19, 1947 the American Association of Blood Banks was formed; and

WHEREAS, The purposes of the American Association of Blood Banks are: (1) To promote and foster the exchange of ideas and materials and the dissemination of information relating to blood banking and its technical methodology by education, publicity and research; (2) to foster and plan for cooperation in times of disaster; (3) to function as a clearing house on questions relating to the training of personnel common to such institutions; (4) to keep currently aware of and encourage high standards of service; (5) to promote and foster and aid and encourage the extension of similar services throughout the United States and its territories; therefore be it

Resolved, That, first, the American Medical Association endorse in principle the program of the American Association of Blood Banks and the local control of policies and operation of blood banking; and, second, that this Association urge the state and county medical societies to aid and encourage the establishment of adequate transfusion services through the setting up of additional blood centers, blood banks and affiliated substations as required to make available adequate supplies of blood and blood derivatives throughout the state; and, third, that this Association go on record as opposing control by centralized national agencies or interferences with the orderly development of transfusion services and new improved technics and knowledge under local initiative.

Resolutions on American Physicians Art Association

Dr. William M. Cockrum, Indiana, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The American Physicians Art Association this year celebrates its tenth anniversary; and

WHEREAS, During these ten years, the American Physicians Art Association has encouraged many hundreds of physicians to engage in painting, sculpturing, etching, photography and other artistic avocations; and

WHEREAS, During this period, the American Physicians Art Association has through its annual art exhibitions added conspicuously to the beauty and cultural atmosphere of the American Medical Association sessions; and

WHEREAS, All these untiring efforts have redounded to the benefit of the entire medical profession and helped to increase public appreciation of the cultural attainments of the medical profession; therefore be it

Resolved, By the House of Delegates of the American Medical Association that the American Medical Association hereby expresses its warm appreciation of all these achievements, and be it further

Resolved, That the Secretary be instructed to present a copy of this resolution to the officers of the American Physicians Art Association.

Resolution on Method of Selecting Each Year the Outstanding General Practitioner by the American Medical Association

Dr. E. S. Hamilton, in behalf of the Illinois State Medical Society, presented, by title, and had copies distributed to all delegates, the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Whereas, The American Medical Association has adopted the practice of honoring one general practitioner as outstanding in the United States each year at the Interim Session of the House of Delegates; and

Whereas, The first award was given last January at the meeting in Cleveland and was widely acclaimed throughout the country, though the process of selection was marred by confusion and misunderstanding; and

Whereas, It is at the local levels that many lay groups and individuals can best learn the importance of preserving the American way of life, including the continuance of the practice of medicine as a private enterprise, and the designation of such outstanding general practitioners can have great value in calling public attention to that importance; and

Whereas, It is desirable that some definite procedure should be established by which the selection of the said outstanding general practitioner originate at the county society level and proceed through state organizations so that local or state groups and individuals may pay tribute to the family physician of their choice; now, therefore, be it

Resolved, That the House of Delegates of the American Medical Association approve and set in operation a plan whereby:

(1) Each county medical society shall be urged to name the candidate of its choice as the outstanding general practitioner for the year within its jurisdiction, basing its selection on nominations and recommendations from any responsible source, lay or professional.

(2) The name of each candidate so chosen by a county medical society, with all pertinent data, including recommendations of lay groups and individuals, shall be submitted by the county medical society to the state medical society of which it is a component part.

(3) Each state medical society, through whatever agency each may designate, shall select from among the candidates submitted by its component county medical societies one name to be declared the outstanding general practitioner within the state.

(4) The candidate so selected at the state level shall be the sole candidate from that state, and his or her name, with all pertinent supporting data, shall be submitted to the Board of Trustees of the American Medical Association.

(5) The Board of Trustees shall select from the names submitted by state societies the names of three persons, these names to be submitted in turn to this House of Delegates, which shall select one name to be declared the outstanding general practitioner of the United States for the year.

(6) Any state medical society desiring to do so may establish and confer a suitable award with fitting public ceremony on the physician it has named as the outstanding general practitioner of that state for the year.

Resolution on Cancellation of Contract with Commercial Insurance Company

Dr. L. G. Christian, on behalf of the Michigan State Medical Society, presented the following resolution, which was referred to the Reference Committee on Medical Service and Prepayment Insurance:

Whereas, The American Medical Association on many occasions has encouraged the formation of nonprofit voluntary prepayment hospitalization and medical service plans by its constituent state and county societies; and

Whereas, These constituent state and county societies have participated in the formation and development of nonprofit voluntary hospitalization programs (nationally known as Blue Cross hospitalization plans); and nonprofit medical surgical service programs (nationally known as Blue Shield plans); and

Whereas, The action of the American Medical Association in canceling its contract with the Chicago Blue Cross which provided hospitalization for the employees of the American Medical Association and in contracting with a commercial insurance company for the same coverage was not in the best interest of the medical profession as a whole or the voluntary Blue Cross and Blue Shield plans; and

Whereas, This action of the American Medical Association has already by adverse publicity caused serious embarrassment to the Blue Cross and Blue Shield plans; and

Whereas, Both Blue Cross and Blue Shield plans are available in Chicago; therefore be it

Resolved, That the House of Delegates of the American Medical Association instruct its Board of Trustees to cancel the contract with the commercial insurance company at the earliest possible time and obtain contracts with the Blue Cross and Blue Shield plans to cover their employees.

Resolution on Blood Banking Agencies and Associations

Dr. F. J. L. Blasingame, in behalf of the State Medical Association of Texas, presented by title a resolution, which was referred to the Reference Committee on Miscellaneous Business.

Resolution on Blood Programs

Dr. Edward H. McLean, for the Oregon State Medical Society, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

Whereas, The need for organized community programs for the procurement and distribution of blood for ordinary civilian use and in time of disaster and national emergency has been recognized; and

Whereas, Such programs are being sponsored by county medical societies, by local voluntary organizations established for the specific purpose, and by local chapters of the American National Red Cross; and

Whereas, It is essential that the county medical society in each community concerned shall supervise and control the technical operation of such programs; therefore be it

Resolved, That in the case of all blood programs sponsored by lay organizations an agreement in the form of a "Statement of Policy" be entered into between the lay organization and the county medical society in substantially the following language:

STATEMENT OF POLICY REGARDING OPERATION OF A BLOOD PROGRAM AT

....
(Name of City)

This Statement of Policy, dated the ..... day of ....
194... by and between the .... (hereinafter called
(Name of lay organization)
"...................") and .... County Medical Society (hereinafter called "Society"),

WITNESSETH:

Whereas, ... and Society desire to set up a
(Name of lay organization)
blood program at .... with a central laboratory at
(Name of City)
.... and distribute blood to approved agencies in ....
(Name of City) (Area to be served)
all in accordance with the policies stated herein, and

Whereas, Parties hereto recognize that the medical profession is particularly qualified to supervise and control the technical operation of such blood program and its related activities.

Now, Therefore, Parties hereto agree that the operation of such a blood program shall be conducted in accordance with the following policies:

1. The .... of Society shall appoint a Technical
(Name of governing body)
Supervisory Committee (hereinafter called "Committee") of five members of Society, two of whom shall be pathologists, one an internist, one a surgeon and one a general practitioner, each of whom shall serve until his successor shall be appointed by the said ....
(Name of governing body)

2. The duties of said Committee shall be as follows:

(*a*) The direct supervision and control of the blood program, central laboratory or laboratories and blood products, including, but not confined to, the specific duties set forth herein.

(*b*) The selection of a Technical Director, who shall be a physician and surgeon with special qualifications to administer the blood program and related activities. Through the Technical Director, the Committee shall select the other technical personnel of the blood program and related activities. The Technical Director shall be directly responsible to the Committee.

(*c*) The establishment of technical standards for such blood program and related activities, which standards are to conform to those set forth in the National Blood Program Technical Manual of the American National Red Cross and all state and federal governmental requirements, provided that more exacting technical procedures may be prescribed by the Committee, when the Committee deems it advisable.

(*d*) The establishment of technical standards for hospitals which are to be serviced under the program, in relation to such program; also the selection of such hospitals and establishment of quotas for each hospital. Hospitals shall be required to have adequate facilities for storage, typing, cross matching, investigation of reactions, and shall supply the blood without charge except for a nominal charge for the administration of the blood, including additional typing and cross matching, which charge shall be uniform for all hospitals.

(*e*) The direction, through the Technical Director, of all volunteers in such program, when their duties involve the technical aspects of the blood program.

(*f*) The review and approval of all publicity controlled by the .... relating to the program, prior to release, in
(Name of lay organization)
order to insure its conformity to professional standards.

3. The .... shall be the sole donor recruitment
(Name of lay organization)
agency and shall procure volunteer donors to the best of its ability.

4. The .... shall provide and pay for all phy-
(Name of lay organization)
sical facilities, equipment, supplies and other functions necessary to carry on the program.

5. The .... shall pay the salaries of all personnel
(Name of lay organization)
engaged in the program.

6. The .... shall secure and pay for adequate
(Name of lay organization)
malpractice and other insurance to cover the liability of the members of the Committee, Technical Director and other employees arising out of the operation of the program, so far as is obtainable.

Resolution on Bureau of Health Education

Dr. Joseph F. Londrigan, for the Medical Society of New Jersey, presented by title a resolution, which was referred to the Reference Committee on Medical Education.

Resolutions on Blue Cross Coverage

Dr. J. D. Hamer, for the Arizona State Medical Association, presented the following resolutions, which were referred to the Reference Committee on Medical Service and Prepayment Insurance:

Whereas, The extension of prepaid health and hospital coverage to the American people is a matter of primary concern to the American Hospital Association and the American Medical Association; and

Whereas, It appears that the widest possible coverage for prepaid hospital and medical benefits can be attained only through the continued support and cooperation of both national organizations; and

Whereas, It has been brought to our attention time and time again that the salvation of the members of the American Hospital Association and American Medical Association from the encroachment on our freedom by compulsory sickness insurance rests in the continued extension of voluntary hospital and prepayment sickness insurance plans; and

Whereas, It appears that recent action taken by the employees of the American Medical Association in forfeiting their Blue Cross coverage and adopting a plan of coverage from a commercial insurance firm has created much unfavorable comment and criticism; now therefore be it

Resolved, That the House of Delegates of the Arizona State Medical Association recommends to the House of Delegates of the American Medical Association that this matter be referred to the Board of Trustees for the purpose of their study, and that the Board of Trustees be empowered to recommend to the General Manager of the American Medical Association that employees of the American Medical Association be brought under existing Blue Cross-Blue Shield prepayment coverage at the earliest possible date; and be it further

Resolved, That a copy of this resolution be sent to the Secretary of the American Hospital Association and to the Secretary of the Blue Cross Commission and to the A. M. C. P. Commission.

Resolutions on Hospital Insurance

Dr. Homer L. Pearson, Jr., Florida, presented by title, since they were included in the Handbook, Resolutions on Hospital Insurance, which were referred to the Reference Committee on Medical Service and Prepayment Insurance.

Resolution on Funds to Defray Expenses of Woman's Auxiliaries of States

Dr. Raymond M. McKeown, Oregon, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

Whereas, Our local, state and national woman's auxiliaries have become an indispensable adjunct of organized medicine; and

Whereas, The local, state and national auxiliaries are especially effective as agencies for furthering the education of the public concerning the aims and accomplishments of scientific medicine; and

Whereas, Their maximum effectiveness requires participation by the wife of every member and sufficient funds to enable them to carry on their essential activities; therefore be it

Resolved,, That each constituent state medical association be urged to budget sufficient funds to defray the cost of the activities of its auxiliary and to pay the annual dues of the national auxiliary, thus making the wife of every member automatically a member of the state and national auxiliaries and eliminating the collection of state and national auxiliary dues from individual auxiliary members.

Resolution on Review of Hospital Standardization

Dr. Raymond M. McKeown, Oregon, presented the following resolution, which was referred to the Reference Committee on Medical Education:

Whereas, The interests of the public and the medical profession as a whole are best served by the establishment and enforcement of hospital and other standards which give due weight to all the various phases of medical service by an agency which represents all aspects of medical practice; therefore be it

Resolved, That the Council on Medical Education and Hospitals be authorized and directed to review the present status of hospital standardization and inspection, and, in cooperation with the constituent state medical associations and with due consideration of the activities of the American College of Surgeons and any comparable organization of specialists and any combinations of any such national organizations, promulgate new and more inclusive standards for hospitals, with the eventual purpose of developing a standardization and inspection service.

Resolutions on Activities of Veterans Administration

Dr. H. Gordon MacLean, California, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

Resolved, That this House of Delegates register its condemnation of the extension of government medical care by bureaucratic interpretation and demand that the Veterans Administration restrict its activities to those specified in existing federal law; and be it further

Resolved, That the practice of medical officers' serving with the Armed Forces under conditions of involuntary service being loaned to a civilian agency for the purpose of providing medical care for disabilities not connected with military service be condemned and means of achieving the discontinuance of such service be sought with all possible vigor.

Resolution on Removal of Fellows from One State to Another

Dr. H. Gordon MacLean, California, presented the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Resolved, That Section 3, Chapter XII of the By-Laws be and is hereby amended by deleting the entire section and substituting therefor the following: "A Fellow who changes the location at which he practices, from the state through whose constituent association he holds membership in the American Medical Association to another state in which there is a constituent association shall forfeit his membership and fellowship in this association, unless within one year after such change of residence he becomes a member of the constituent association of the state to which he has moved."

Resolution on Change of Residence

Dr. H. Gordon MacLean, California, presented the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and ByLaws:

Resolved, That Section 1, Chapter XII of the By-Laws be and is hereby amended by deleting the following: "*Provided*, that when the member is also a Fellow of the Scientific Assembly the By-Law defining the effect on Fellowship of removal to another state shall have precedence over this section."

Resolution on National Health Assembly

Dr. Thomas K. Lewis, New Jersey, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Whereas, The National Health Assembly, a Corporation not for profit, was formed February 17, 1948, on proper application by Abe L. Savage and Cornelius A. Wood Jr., with offices at 4605 and 4611 in the Federal Security Administration quarters in Washington, D. C., and Harold M. Marsh, a private attorney; and

Whereas, The term for which said corporation is originated shall be *perpetual;* and

Whereas, The particular business and object of said corporation shall be: (*a*) to engage in such activity as may facilitate the closing of the gap between the present knowledge of medical science and the organization of the basic services which make this knowledge generally applicable to the people of the several states, the District of Columbia and the possessions of the United States of America, by assembling and disseminating information relating to medical and other studies and research in the fields of health and welfare, and by arranging, sponsoring, conducting, financing and/or participating in the financing of conferences, conventions and/or other meetings of organizations and of individuals, both public and private, engaged in or interested in activities directed to advancing health and welfare; (*b*) to cooperate with individuals and organizations, both public and private and with federal, state and international agencies and organizations looking to the correlation, integration and/or aid of studies and research in the field of health and welfare; (*c*) to provide financial assistance for the study of problems relating to the health and welfare of the people of the several states, the District of Columbia and the possessions of the United States of America; (*d*) to engage in such other educational public activities as may promote the health and welfare of the people of the several states and District of Columbia and the possessions of the United States of America; and

Whereas, The first meeting of the National Health Assembly was held at the call of Mr. Oscar Ewing, Federal Security Administrator, in Washington, D. C., on May 1-4, 1948; and

Whereas, Mr. Ewing publicly has stated: "President Truman has made known that he and his Administration favored National Health Insurance, and, naturally, I had no right to accept an office in his Administration unless I was wholeheartedly prepared to go along with the President's policies. Furthermore, I explained that, I happened to agree with that policy thoroughly and that it was one for which I expected to fight"; and

Whereas, Findings of the several panels of this Assembly have resulted in recommendations providing that the solution of the problems of medical education, medical research, dental education, dental research and the distribution of medical and dental care involve, in most instances, federal financing and/or Federal subsidy; and

Whereas, Several recommendations are in direct conflict with actions taken by this House of Delegates concerning federal participation in the financing and distribution of medical care in the United States as elucidated in the Ten Point Program in Section 3, "When local funds are lacking for the care of those unable to pay, federal aid should be supplied with the funds administered through local or state agencies" and, further, Section 5—in connection with facilities: "Such facilities are preferably supplied by local agencies, including the community, church and trade agencies which have been responsible for the fine development of facilities for medical care in most American communities up to this time. Where such facilities are unavailable and cannot be supplied through local or state agencies, the federal government may aid, preferably under a plan which requires that the need be shown and that the community prove its ability to maintain such institutions once they are established" (Hill-Burton Bill); and

Whereas, It is the opinion generally held that the National Health Assembly with a permanent Charter has as its main purpose the introduction of a new technic for the purpose of the promotion of a form of complete government medical and dental service. The necessity is created for this House of Delegates to take action to reaffirm its previously expressed policies on this subject or to formulate a new basic policy in connection with federal participation in the financing and distribution of medical and dental care; therefore be it

Resolved, That this House of Delegates go on record as reaffirming actions previously taken dealing with this important subject.

Resolution on Purveyal of Medical Service Involving Amendment to Principles of Medical Ethics

Dr. John M. Fallon, Massachusetts, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

Whereas, The House of Delegates this afternoon has been informally advised that it is unethical for physicians to be employed by lay organizations in such way that profits from their professional services be diverted from the physician to the lay organization; be it therefore

Resolved, That the Judicial Council be instructed to add the following sentence to Chapter III, Section 5 of the Principles of Medical Ethics: "The terms of employment between physicians and lay organizations shall preclude diversion to the lay organization of profits derived from the professional service of the physician."

Resolution on Voluntary Insurance

Dr. Stephen R. Monteith, in behalf of the Medical Society of the State of New York, presented by title a Resolution on Voluntary Insurance, which was referred to the Reference Committee on Medical Service and Prepayment Insurance.

On motion of Dr. E. Vincent Askey, California, seconded by Dr. Edwin S. Hamilton, Illinois, and carried, the House requested that Dr. Paul R. Hawley be invited to present a fifteen minute address before the House as the first order of business on Tuesday afternoon.

Nominations for Honorary Fellowship

Dr. George F. Lull, Secretary, presented the following report from the Council on Scientific Assembly:

The Council has considered the scientific attainments and professional character of the following: Dr. Raffaele Paolucci, Director of the Surgical Clinic of the University of Rome, Italy; Dr. A. M. Dogliotti, Director of the Surgical Clinic of the University of Turin, Italy, and President of the Italian Section of the International College of Surgeons; Dr. Francisco Grana, Lima, Peru, and recommends them for approval by the House of Delegates for Honorary Fellowship, provided ways and means can be found to fulfil the requirements of the present By-Laws.

On motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. H. B. Everett, Tennessee, and carried, these physicians were elected to Honorary Fellowship, but the Speaker declared that this had to lay over until tomorrow.

On motion of Dr. F. F. Borzell, Pennsylvania, seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and carried, the House went into executive session at 5:15 p. m.

Executive Session

The House met in Executive Session in the Red Lacquer Room of the Palmer House, Chicago, at 5:15 p. m., with the Speaker, Dr. R. W. Fouts, in the Chair.

The following resolutions were presented and referred as indicated:

1. Resolution on Disapproval of Utterances of a Representative at National Health Assembly, introduced by Dr. Lowell S. Goin on behalf of the California delegation, was referred to the Reference Committee on Executive Session.
2. Dr. Donald Cass, for the California delegation, presented a Resolution on Nonsubscription to Some of Principles Adopted by National Health Assembly, which was referred to the Reference Committee on Executive Session.
3. Dr. F. J. Pinkerton, Hawaii, presented Resolutions on Red Cross Blood Bank Program, which were referred to the Reference Committee on Miscellaneous Business with the request that that committee meet in executive session when considering them and report in executive session.
4. Dr. George E. Armstrong, United States Army, presented Resolutions on Advancement of Rank of Surgeons General of Army and Navy and of Air Surgeon, which were referred to the Reference Committee on Legislation and Public Relations, which may report in open session.
5. Dr. John W. Green, California, presented Resolutions on Washington Office of the American Medical Association, which were referred to the Reference Committee on Legislation and Public Relations.
6. Dr. Philip W. Morgan, for the Kansas Medical Society, presented Resolutions on Expression of Gratitude, which were referred to the Headquarters Office without reference to a committee.
7. Dr. Allen H. Bunce, Georgia, presented the Resolution on Staff Personnel at Headquarters, introduced by him by title during the morning, which was referred to the Reference Committee on Executive Session.

The House recessed at 5:30 p. m. to reconvene in regular session at 1:15 p. m., Tuesday, June 22, 1948.

Second Meeting—Tuesday Afternoon, June 22

The House of Delegates was called to order at 1:40 p. m. by the Speaker, Dr. R. W. Fouts.

The Speaker announced the appointment of Dr. C. F. Strosnider, North Carolina, to take the place of Dr. Thomas S. Cullen, Maryland, who was not in attendance, on the Reference Committee on Medical Education, and of Dr. D. A. Rhinehart, Arkansas, to take the place of Dr. W. R. Brooksher, who was not in attendance on the Reference Committee on Medical Service and Prepayment Insurance.

Because two members of the Reference Committee on Miscellaneous Business had introduced resolutions on a subject which that reference committee was to consider, the Speaker declared that they had disqualified themselves as members of the reference committee and that the committee would consist of Dr. E. S. Hamilton, Illinois, as chairman, and Drs. Thomas M. Brennan, New York, Charles R. Rountree, Oklahoma, C. R. Keyport, Michigan, and John H. Moore, North Dakota.

The Speaker also announced that the Report of the Council on Scientific Assembly was being taken back from the Reference

Committee on Medical Education, to which it had been referred and was being referred to the Reference Committee on Sections and Section work.

Address of Dr. Paul R. Hawley

Dr. E. L. Henderson, Chairman, Board of Trustees, announced that Dr. Hawley requested that his address be heard in Executive Session. Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, moved that the request be granted and the motion was seconded by several and carried.

Dr. A. A. Walker, Alabama, stated that it was his understanding that former Presidents of the American Medical Association were permitted to remain in Executive Session and moved that that privilege be extended to former Vice-Presidents. The motion was seconded by several and carried.

On motion of Dr. B. H. Minchew, Georgia, severally seconded, and carried by a standing vote, secretaries of constituent state medical associations were granted permission to attend the Executive Session.

A motion of Dr. H. B. Goodrich, Missouri, seconded by Dr. T. K. Gruber, Michigan, to admit presidents and chairmen of councils of constituent associations was lost.

Dr. E. Vincent Askey, California, moved that the House proceed immediately with the order of business, and the motion was seconded by several and carried. The House went into Executive Session at 2 p. m.

Executive Session

The House convened in Executive Session at 2. p. m. with Dr. R. W. Fouts, Speaker, presiding.

Dr. E. L. Henderson, Chairman, Board of Trustees, introduced Dr. Paul R. Hawley, who addressed the House in Executive Session.

On motion of Dr. Mather Pfeiffenberger, Illinois, seconded by Dr. George W. Kosmak, New York, and carried, the House arose from Executive Session at 2:15 p. m.

Tuesday Afternoon—Continued

The House reconvened in regular session at 2:15 p. m. with the Speaker, Dr. R. W. Fouts, presiding.

Minutes

It was moved by Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, that the House dispense with the reading of the minutes.

Report of Reference Committee on Amendments to Constitution and By-laws

Dr. Arthur J. Bedell, Chairman, presented the following report: 1. Resolution on Opposition to Amendment to Constitution: Your reference committee recommends that Article 5, Section 1, paragraph (*A*) of the revised Constitution (Article 8, Section 1 of the present Constitution) be amended to read as follows:

"A. Active Members. Active membership shall be limited to those members of constituent associations who (1) hold the degree of Doctor of Medicine or Bachelor of Medicine and (2) are entitled to exercise the rights of active membership in their constituent associations, including the right to vote and hold office, as determined by their constituent association, subject to the provisions of the By-Laws."

2. Resolution on Removal of Fellows from One State to Another: Your committee finds that this resolution is covered by Chapter II of the By-laws on page 7 of the proposed revised Constitution and By-Laws and that part of Division II, Chapter IV by Section 2 reading as follows:

"The rules governing fellowship in case of removal of the practice of a fellow to another state shall be the same as the rules governing membership."

The rules governing membership, Chapter. II of the By-Laws, read as follows:

Membership in this Association shall continue as long as a physician is a member of a component society of the constituent association through which he holds membership. When the Secretary is officially informed that a member is not in good standing in his component society he shall remove the name of said member from the membership roll. A member shall hold his membership through the constituent association in the jurisdiction in which he practices. Should he remove his practice to another jurisdiction he shall apply for membership through the constituent association in the jurisdiction to which he has moved his practice. Unless he has transferred his membership within one year after such change of practice, the Secretary shall remove his name from the roster of members.

3. Proposed Amendment to By-laws Re Citation for Distinguished Lay Service: Your committee recommends that the following be made Chapter XV:

CHAPTER XV. CITATION FOR DISTINGUISHED SERVICE

Section 1. CITATION FOR DISTINGUISHED SERVICE.—The Board of Trustees shall create and establish a citation to be known as "The Citation for Distinguished Service" which shall consist of a suitably engrossed citation. The Board of Trustees shall consider the merits of nominees for this citation who shall be persons not of the medical profession who have, by their cooperation and aid in the advancement of medical science, medical education or medical care, contributed to the achievement of the ideals of American medicine.

Section 2. The Board of Trustees shall nominate to the House of Delegates on the first day of the annual session of each year not more than three persons for this citation. The House of Delegates shall then select the recipient of this citation from the nominees so submitted, the selection to be made by ballot.

Section 3. The Board of Trustees shall be charged with the duty of preparing a suitable citation and arranging for the time and place of its presentation.

Respectfully submitted,

ARTHUR J. BEDELL, Chairman.
WILLIAM F. COSTELLO, Secretary.
JAMES Q. GRAVES.
HOWARD R. DUDGEON.
THEODORE H. HARWOOD.

Dr. Bedell moved adoption of the report of the reference committee dealing with the Resolution on Opposition to Amendment to Constitution and the motion was seconded by several and carried

The portion of the report of the Reference Committee referring to the Resolution on Removal of Fellows from One State to Another was adopted on motion of Dr. Bedell, seconded by Dr. H. B. Everett, Tennessee, and carried.

Dr. Bedell moved adoption of the report of the Reference Committee, recommending addition of a chapter dealing with Citation for Distinguished Service, and the motion was seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried after discussion by Dr. Bedell and the Speaker.

On motion of Dr. Bedell, seconded by several and carried, the report of the reference committee was adopted as a whole.

Dr. E. L. Henderson, Chairman, Board of Trustees, asked whether some one could be elected at this session and after discussion by the Speaker, Dr. Henderson and Dr. Bedell, Dr. James R. Reuling, New York, moved that the Board of Trustees be requested to present names at this session, and the motion was seconded by several. There was discussion by Dr. Henderson, Dr. Reuling, the Speaker, Dr. E. Vincent Askey, California, and Dr. W. F. Costello, New Jersey. After an interval during which the Speaker did not put the vote, it was moved by Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, that the citations be created at this session.

Report of Reference Committee on Reports of Officers

Dr. Allen H. Bunce, Chairman, presented the following report, which was adopted section by section and as a whole on motions of Dr. Bunce, duly seconded and carried. (During the presentation of the report dealing with the Speaker's address, the Vice-Speaker presided.)

Your Reference Committee on Reports of Officers presents the following report:

1. President's Address: The President's address presents an excellent review of the activities of the American Medical Association which is worthy of the attention of the physicians not only of this country but elsewhere as evidence of the widespread interests in which the Association is engaged. With a feeling of innate modesty our President fails to mention the excellent work which he has done in acquainting the public and the profession with the aims and purposes of American medicine in its efforts to provide the people with what may be designated as the most satisfactory medical care in the world and this without control by a central government. Your committee congratulates the retiring President on the success of his administration of the affairs of the Association which have been delegated to him as his responsibilities and which he has carried out so ably.

Your committee commends the President's address for the careful study of each and every member of the House of Delegates and suggests that the members carry back to their constituent associations his summary of the great work of the Association.

2. Speaker's Address: The address of the Speaker reflects his personal endeavor to carry out the recommendations of the House to expedite its extensive business and your committee commends him for his devotion to his onerous duties.

The appointment of reference committees in advance of the meeting is a desirable feature and should not constitute any difficulty for the state associations in the selection of their delegates. It would appear that a simple resolution by each constituent association and society to make the term of office of delegates begin January first following their own annual meeting should be sufficient and make unnecessary any changes in their constitutions and by-laws. Your committee recommends that the Secretary of the American Medical Association again notify the secretaries of the constituent associations of this action of the House of Delegates.

Dr. Fouts' association with this body as delegate, Vice-Speaker and Speaker deserves this note of appreciation by your reference committee and should likewise call for a rising vote of confidence for his accomplishments and his devotion to the duties of the office to which he was elected.

Respectfully submitted,

Allen H. Bunce, Chairman.
George W. Kosmak.
Louis M. Orr II.
Walter E. Vest.
Roland W. Stahr.

Resolutions on "Free Blood" Feature of Red Cross National Blood Program

Dr. Scott Lord Smith, New York, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business.

Whereas, That portion of the Red Cross National Blood program which is designed to furnish free blood to any person in need of it, regardless of his financial status, constitutes (1) a serious breach in the bulwark of our American free enterprise and consequent personal responsibility, social structure, and (2) an ominous precedent for future social change; and

Whereas, From the pamphlet "Report to Physicians by American Red Cross," (1) no charge can be made by the Red Cross for blood because it is obtained from voluntary donors, and (2) charge for its administration is the prerogative of the individual hospital or physician; and

Whereas, The Red Cross has done splendid work in providing blood during national emergencies and would undoubtedly be needed in future crises; and

Whereas, It is therefore imperative that a Red Cross blood program be kept in active existence; and

Whereas, The House of Delegates at the last interim session approved in principle the Red Cross National Blood Program; therefore be it

Resolved, That hospitals, blood banks or other agencies dispensing blood obtained from Red Cross donors be authorized to make a "ready-to-serve" or "standby" charge for their services in addition to the service charge. This charge to be, for private patients one-half the locally current rate for transfusions; for semiprivate patients, one-third the local rate; for ward patients, no charge; and where the blood is dispensed in the home, the same as the "service charge" made by the physician administering the blood; and be it further

Resolved, That this House of Delegates desires to keep open every feasible avenue to obtain supplies of blood.

Resolution on Housing

Dr. Edward H. McLean, Oregon, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Whereas, The health and medical care of the indigent and semi-indigent have been and continue to be a major concern of the medical profession; and

Whereas, The housing of the individual is one of the important factors in the preservation of health and the prevention of disease; and

Whereas, The advocates of federal paternalism are proposing, on the basis of sentimental appeal and play on humanitarian emotions, a vast program of public housing ostensibly to meet the needs of the indigent and semi-indigent; and

Whereas, This program is deceptive in that it does not provide housing for the chronically ill, the indigent ,the unemployable, the casual worker, or the very low wage earner, since they cannot make the regular payments required by the contract, even with exemption from state and local taxes; and

Whereas, The proponents of this legislation openly admit that this program will put the federal government permanently into the business and control of all housing, with the elimination of private housing; and

Whereas, Similar public housing programs have been disastrous failures throughout Europe, in that they did not produce more houses, they did not produce houses for the poor, they did not remove slums and they did not reduce the prevalence of disease, but did become dangerous drains on the national treasuries; and

Whereas, These European government housing programs were one of the principal means by which socialistic cabinets and parliaments captured control; and

Whereas, Similar tendencies have already appeared in the propaganda machines of many housing authorities in this country, in the political corruption involved in the placement of housing projects and in the selection of tenants; therefore be it

Resolved, That this body record its unqualified opposition to any further encroachment of the federal government in the housing business.

Resolutions on Veterans' Administration Submitted by Board of Trustees as Supplementary Report

Dr. E. L. Henderson, Chairman, Board of Trustees, submitted as a Supplementary Report the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

Whereas, Point seven of the Ten-Point National Health Program of the American Medical Association states: "The veteran shall be entitled to the highest available quality of medical care in accordance with existing law, and preferably in his community with a physician and hospital of his own choice"; and

Whereas, The Veterans Administration has the authority under certain conditions in service-connected disability and disease to make use of private practitioners and hospitals, thus allowing free choice; and

Whereas, The Veterans Administration is in urgent need of its presently available full time and part time personnel for pension and compensation examinations, for veteran hospital care and for authorization and administrative duties; and

Whereas, Proposed increases in the military services including those added by new draft provisions will tend to reduce the number of physicians available for Veterans Administration personnel; and

Whereas, Hospital care in private hospitals and the additional beds to be provided under the Hill-Burton legislation may limit the building of additional veterans' hospitals beyond our present day needs and available personnel; and

Whereas, Numerous veterans in many states have requested the right to make their own choice of physician and hospital in the treatment of their service-connected disability or disease; be it therefore

Resolved, That this House of Delegates of the American Medical Association request the Veterans Administration to put into uniform practice a free choice regulation for medical and hospital treatment in service-connected cases; and be it further

Resolved, That we urge state medical societies or associations to conform to this principle when making contracts or agreements with the Veterans Administration.

Report of Committee to Study Revision of the Constitution and By-Laws

Dr. F. F. Borzell, Chairman, presented a part of the proposed Revision of the Constitution and By-Laws, a mimeographed copy of which had been sent each member of the House, reading first the Constitution section by section, which sections were adopted individually and as a whole on motion of Dr. Borzell, duly recorded and carried, after amendment, with the exception of Section 3, Article 9, which was referred to the committee for rewording. Later, the committee submitted Section 3, Article 9, of the Constitution as it had been reworded, and this Section was adopted, on motion of Dr. Walter E. Vest, West Virginia, duly seconded and carried.

Dr. Borzell then read part of the proposed revised By-Laws until Dr. J. D. McCarthy, a member of the committee, relieved him. The By-Laws were adopted after amendment section by section on motions duly seconded and carried.

Dr. Mather Pfeiffenberger, Illinois, moved the adoption of the By-Laws as amended as a whole. Dr. George W. Kosmak, New York, moved to amend the motion that consideration be given to the appointment of a committee of three members from the committee that drew up these By-Laws, including the chairman, to edit and revise them in accordance with the suggestions made at this meeting. Both the original motion and the amendment were severally seconded and carried. Dr. Borzell thanked the members of the committee for their help.

Dr. Walter E. Vest, West Virginia, moved that the committee be thanked by a rising vote and the audience arose for the purpose.

A copy of the revised Constitution and By-Laws will be published after the committee to edit them has turned in its report.

Dr. James R. Reuling, New York, moved that the House recess until 9:30 a. m. Wednesday, June 23, and that the first order of business be the Executive Session, and the motion was seconded by several, and carried.

Third Meeting—Wednesday Morning, June 23
Executive Session

The House reconvened in Executive Session at 10 a. m., Wednesday, June 23, 1948, with the Speaker, Dr. R. W. Fouts, presiding.

The speaker read from the new Constitution and By-Laws referring to what an Executive Session is.

A motion of Dr. Thomas P. Murdock, Connecticut, to include certain officers of constituent associations, seconded by Dr. Walter E. Vest, West Virginia, and carried after amendment to include other individuals, was passed so that the House voted to include in Executive Session the presidents, secretaries, executive secretaries and editors of journals of constituent associations.

Report of Reference Committee on Credentials

Dr. G. Henry Mundt, Chairman, reported 173 delegates registered and requested that if the delegate from Puerto Rico is known to any of the delegates, he be requested to get in touch with Dr. Mundt.

Report of Reference Committee on Executive Session

Dr. Charles H. Phifer, Chairman, presented the following report:

1. Resolution on Nonsubscription to Some of Principles Adopted by National Health Assembly: Your reference committee has carefully considered this resolution. It has been informed that this is a preliminary recommendation of a lay committee and that the final action on this recommendation will be considered in the near future. Your reference committee recommends that at that time the representatives of the American Medical Association reaffirm to the officers of the National Health Assembly that the means test be utilized as a prerequisite for free medical service.

2. Resolution on Staff Personnel at Headquarters:

Your reference committee has given careful consideration to this resolution. It is of the opinion that the highly trained personnel from the headquarters office of the American Medical Association should be available to any committee requesting advisory service. It is the belief of your reference committee that diplomacy and tact can be used in the utilization of this service.

3. Resolutions on Editorials in The Journal of the American Medical Association: The resolutions were introduced unsigned. No one appeared to support them. It is the opinion of your reference committee that the Board of Trustees of the American Medical Association alone is responsible for the editorial policies as expressed in the various publications of the American Medical Association.

4. Resolution on Change in Constitution: It is the opinion of your reference committee that the component medical society is the sole judge as to whom it elects to membership, provided the applicant shall meet the medical requirements for membership, and so recommend.

5. Resolution on Disapproval of Utterances of a Representative at National Health Assembly: This resolution pertains to statements of representatives of the American Medical Association.

Your reference committee heard members of the American Medical Association in reference to both sides of this question. Several of these witnesses were in attendance at the Conference of the National Health Assembly in Washington. It developed during the inquiry that there was a misunderstanding in reference to statements made during the Assembly by representatives of the American Medical Association. A physician representing a member who introduced the resolution attended the hearing and requested that the resolution be withdrawn, thus disposing of the resolution.

Respectfully submitted.

Charles H. Phifer, Chairman.
George Braunlich.
A. A. Walker.
Raymond L. Zech.
Walter F. Donaldson.
George P. Johnston.
W. A. Coventry.

Dr. Phifer moved adoption of the report of the reference committee on the Resolution on Nonsubscription to Some of Principles Adopted by National Health Assembly, and the motion was seconded. Dr. Phifer accepted the suggestion of Dr. Lowell S. Goin, California, to include "and the use of government funds." With the inclusion of these words the House adopted the first section of the report of the reference committee after discussion by Dr. Lowell S. Goin, California, Dr. Walter E. Vest, West Virginia, and Dr. Phifer.

It was moved by Dr. Phifer and seconded by Dr. H. B. Everett, Tennessee, that the report of the reference committee on the Resolution on Staff Personnel at Headquarters be adopted. After discussion by Dr. John W. Cline, California, and Dr. Phifer, Dr. Cline moved as a substitution the adoption of the resolution as presented by Dr. Allen H. Bunce, Georgia, and this motion was seconded by Dr. Lowell S. Goin, California, and carried after discussion by Dr. Allen H. Bunce, Georgia, and Dr. Cline.

The report of the reference committee, dealing with the Resolutions on Editorials in The Journal of the American Medical Association was adopted on motion of Dr. Phifer, seconded by several and carried.

Dr. Walter E. Vest, West Virginia, moved adoption of the section of the report of the reference committee referring to Resolutions on Staff Personnel at Headquarters as amended and the motion was seconded by several and carried.

It was moved by Dr. Phifer that the report of the reference committee on the Resolution on Change in Constitution be adopted. The motion was severally seconded and carried.

Dr. Phifer moved adoption of the report of the reference committee on the Resolution on Disapproval of Utterances of a Representative at National Health Assembly. The motion was seconded by Dr. John W. Cline, California, and carried.

Report of Reference Committee on Emergency Medical Service

Dr. George E. Armstrong, Chairman, presented the report of the Reference Committee on Emergency Medical Service, which was adopted section by section and as a whole, after discussion and amendment. The report as amended reads:

1. Report of Council on National Emergency Medical Service as printed in Handbook: The first order of business was a consideration of the basic principles promulgated by the Council on National Emergency Medical Service as published in the House of Delegates Handbook. A consideration of these principles resulted in the following action by the Committee:

1. Approved as published.
2. Approved as published.
3. The first paragraph was approved as printed. However, it was unanimously decided that the second paragraph should be completely revised to read as follows:

"Plans should be immediately initiated which would insure procedures by which a single physical examination prior to induction into the armed forces will be carried out."

4. Approved as published.
5. Approved as published.
6. Approved as published.
7. Approved as published.
8. It was unanimously decided that paragraph 1 of Section 8 should be deleted completely. It was further agreed that paragraph 2 in the same section should be revised to read as follows:

"In the event of war or threatened war, requiring the procurement by the military establishment of medical officers from civilian life, *reasonable* provision should be made for their replacements after tour of active duty by others from civilian life." This merely consisted in the insertion of the word "reasonable" before the word "provision" and the deletion of the word "reasonable" from its position before the word "tour."

9. Approved as published.

2. Subjects Presented to Reference Committee by Dr. Richard L. Meiling, Secretary, Council on National Emergency Medical Service: The second general subject considered by the Reference Committee followed the appearance before it of Dr. Meiling, Secretary of the Council on National Emergency Medical Service. At his request, the following subjects were discussed and unanimously approved:

(*a*) The Council on National Emergency Medical Service requests that each state medical association or society and its component county medical societies, as well as the Medical Society of the District of Columbia, appoint and organize a committee directly responsible for national emergency medical service within its organization. Each such state committee is requested to present to the American Medical Association, Council on National Emergency Medical Service, a list of its members, as well as of the members of its component county society committees, and the terms of organization under which the committee is authorized to function. It is further requested that each state association cooperate fully with the Committee on National Emergency Medical Service in its program to meet the great and growing problems of medical health and sanitary services confronting the medical profession as related to national defense.

(*b*) Inasmuch as during times of peace as well as in times of national emergency a majority of the physicians composing the medical corps of the armed forces are of civilian origin, equitable general and flag ranks should be provided for amongst these civilian components of the armed services.

3. Resolutions on Emergency Medical Service: The third general subject considered and approved was the resolutions introduced by Dr. Ralph B. Eusden of California, with the notation that the resolution should begin "*Resolved,* That the American Medical Association through its Council on National Emergency Medical Service . . ."

Respectfully submitted,

GEORGE E. ARMSTRONG, Chairman.
HUGH P. SMITH.
WYMAN D. BARRETT.
MORTON D. WILLCUTTS.
GEORGE A. WOODHOUSE.
RAYMOND M. MCKEOWN.

Report from Reference Committee on Executive Session

Dr. Charles H. Phifer, Chairman, stated that the gentleman who introduced the Resolution on Change in Constitution reported on by the Reference Committee on Executive Session previously, desires to have his name withdrawn, and the committee desires to comply with the request and simply state that the resolution was received. The request was complied with by vote of the House.

Dr. Phifer reported further that the resolution referred to has received great publicity in New York and requested information as to whether the report in Executive Session should be released. On vote of the House it was agreed that the report of the reference committee stating in effect that the county medical society is the sole judge of its membership could be released.

Announcement of Secretary

Dr. George F. Lull, Secretary, announced that it was certain that the printers and managers had come to an agreement for a contract for eighteen months.

Request for Copies of Dr. Paul R. Hawley's Address

It was moved by Dr. William M. Skipp, Ohio, seconded by several and carried, that a copy of the address of Dr. Paul R. Hawley be given each member of the House.

On motion of Dr. H. B. Everett, Tennessee, duly seconded and carried, the House rose from Executive Session at 11 a. m.

Wednesday Morning—Continued

The House of Delegates convened in regular session at 11 a. m., the Speaker, Dr. R. W. Fouts, presiding.

Resolution on Membership in Council on Medical Education and Hospitals

Dr. Hilton S. Read, New Jersey, presented the following resolution, which was referred to the Reference Committee on Medical Education:

Mindful of the fact that 90 per cent of medical care in this country is dispensed in communities outside of medical centers and that an important function of the Council on Medical Education and Hospitals is the husbanding of medical education in these communities; therefore be it

Resolved, That this House directs the Board of Trustees to limit its nominations for one of the members of this Council to private practitioners of medicine, not faculty members of a medical school nor on the staff of a hospital asociated with a medical school or university.

Resolutions on Shortage of Interns

Dr. Robert H. Hayes, Illinois, presented the following resolutions, which were referred to the Reference Committee on Medical Education:

WHEREAS, The community hospital is confronted with a critical problem, "a shortage of interns"; and

WHEREAS, Without interns, the community hospital is seriously handicapped; and

WHEREAS, The American Medical Association is attempting to encourage its members to administer the best medical care possible to the sick; and

WHEREAS, The larger hospitals are now obtaining the greater percentage of the medical graduates as interns, and

WHEREAS, An intern who completes his training in a community hospital is well equipped for the general practice of medicine, and

WHEREAS, By our present day practices we are reducing the number of general physicians; therefore be it

Resolved, That in order to preserve the general practice of medicine, the American Medical Association institute a program to limit the number of interns of all approved hospitals on an equal basis according to yearly admissions, and be it further

Resolved, That this be referred to the Council on Medical Education and Hospitals for consideration.

Resolutions on National Congress of Parents and Teachers

Dr. Elmer Hess, Pennsylvania, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The National Congress of Parents and Teachers has requested the cooperation of the American Medical Association through several of its departments, including the Council on Medical Service, the Committee on Rural Medical Service and the Bureau of Health Education; and

WHEREAS, The objectives of the National Congress are in many ways identical or similar to the objectives of the American Medical Association, particularly in the area of public health, school health services and health education; and

WHEREAS, The National Congress, in common with the American Medical Association, stands for local autonomy in government and for local health councils and for the maintenance of high standards of medical care, with emphasis on the responsibility of the home and the family physician; and

WHEREAS, The National Congress has a 4-point Health Program which is in general harmony with the 10-Point Health Program of this Association; therefore be it

Resolved, That it is the sense of this House of Delegates that the aforementioned departments of this Association, or other appropriate departments, be directed to cooperate fully with the National Congress so far as its objectives coincide with those of the American Medical Association; and be it further

Resolved, That this House of Delegates recommends that representatives of state medical associations enter into conferences with state health departments, state boards of education, and state Congresses of Parents and Teachers in order to counsel, advise, guide and assist the National Congress of Parents and Teachers in the attainment of our mutual objectives.

Request for Interpretation of the Question of Balloting

Dr. W. A. Coventry, Minnesota, requested an interpretation of the question of balloting as it appears in the Handbook, and the Speaker referred to this to the Reference Committee on Rules and Order of Business.

Greetings to Canadian Medical Association

It was moved by Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. Walter E. Vest, West Virginia, and carried, that a message of greeting and best wishes be sent to the Canadian Medical Association, now in session, to be composed by the Secretary of the Association and sent immediately.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. W. P. Anderton, Chairman, presented the following report dealing with the report of the Secretary, which on motions of Dr. Anderton, duly seconded and carried, was adopted section by section and as a whole:

REPORT OF THE SECRETARY

Your Reference Committee on Reports of Board of Trustees and Secretary has considered carefully the matters assigned to it in the Handbook distributed to this House of Delegates. It commends highly to you the Secretary's report. It is a fine example of what Dr. George Lull can do.

This report states that on April 1, 1938, there were 109,435 members of the American Medical Association and 173,879 physicians in the United States and its dependencies, showing that only 62.3 per cent of those eligible were members of our Association. In 1948, there are 201,200 physicians in the United States and its dependencies and 136,668 members of the American Medical Association. This shows an increase in the total and in the percentage of members of the American Medical Association during the last ten years. However, these figures show that 67.9 per cent of the physicians in the United States are members of the American Medical Association, whereas 32 per cent are not members. Your committee recommends that this House request the Board of Trustees to initiate a strong and persevering drive for new members extending through the constituent associations to the component societies, where vigorous committees should seek to enroll every eligible doctor.

The Secretary described in his report the cohesive value of the Annual Conference of State Secretaries and Editors. He includes a chart entitled "Organization of Constituent State and Territorial Medical Associations," April 1, 1948, which is worthy of study, although your committee feels that the column entitled "Number of Physicians in State 17th Ed. Directory" might well have been dated 1942.

Dr. Lull states that he has carried out the directives of the House of Delegates. What he has done, he has done well. However, your committee recommends that matters referred from this House for action or study or recommendation should each be reported on specifically, under some such heading as "Résumé of Matters Referred from House of Delegates."

Dr. Lull's short paragraph regarding his field activity is another example of his modesty. He has accomplished a great deal for the American Medical Association by his various speeches in different parts of the country. Many members who do not go to the annual session of the American Medical Association hear him, and have their faith and interest stimulated in our great body.

The wisdom in the appointment of Dr. Ernest B. Howard as Assistant Secretary is manifest. Your committee hopes it frees Dr. Lull from ordinary routine work of his office. The office of executive assistant has also been created, and Mr. Lawrence W. Rember has been occupying that post since last December, while Theodore R. Sills & Co. have been acting as public relations counsel. Considerable space in Dr. Lull's report is given to Mr. Rember's efforts and accomplishments for the public and the profession. It will take more than six months to evaluate the results. Your committee commends the Secretary's newsletter as helping many to keep in touch with the headquarters office. It is heartening to know that Dr. Lull believes the Press Relations Bureau has been a constructive effort and that the many other public relations activities have been beneficial for the Association.

Dr. Lull's well phrased peroration expresses his appreciation to his fellow members and the headquarters staff. In this your committee joins in the name of the House of Delegates.

SUPPLEMENTARY REPORT OF THE SECRETARY

In his Supplementary Report Dr. Lull took up two topics: The 1948 Budget for Public Relations and the labor situation at 535 North Dearborn Street.

Dr. Lull stated that the Public Relations estimated budget for 1948 had been inadvertently omitted from his original report. The item amounts to $397,000. This does not include public relations features accomplished by several committees, councils and officers.

In explaining the general labor conditions at headquarters, he told about the compositors' strike and how it is part of a similar citywide effort that became incipient in January and fully manifest on March 8, 1948. He stated that 230 out of 300 unionized employees are working loyally. THE JOURNAL and other publications are still appearing. Your committee congratulates Dr. Lull and his staff for their resourcefulness.

Respectfully submitted,

WALTER P. ANDERTON, Chairman.
THOMAS A. FOSTER.
WARREN L. ALLEE.
JESSE D. HAMER.
HERMAN A. LAWSON.

Report of Reference Committee on Legislation and Public Relations

Dr. Thomas A. McGoldrick, Chairman, presented the following report, which, on motions of Dr. McGoldrick duly seconded and carried, was adopted section by section and as a whole after discussion and amendment:

1. Resolution on Policy of Federal Children's Bureau: Your reference committee recommends that the House of Delegates of the American Medical Association enter a formal protest against this policy with the Federal Security Administrator, recommending to him that the Administration's policy be liberalized to permit participation on a state level by all physicians qualified.

2. Resolutions on Federal Grants-in-Aid to States: Your reference committee recommends approval of these resolutions.

3. Resolutions on Bacteriological Warfare: Your reference committee recommends that no action be taken by this House of Delegates on these resolutions.

4. Resolution on the National Health Assembly: Your reference committee recommends approval of this resolution.

5. Resolution on Association of Interns and Medical Students: Your reference committee recommends approval of this resolution.

6. Resolutions on Advancement of Rank of Surgeons General of Army and Navy and of Air Surgeon: Your reference committee recommends approval of these resolutions.

7. Resolution on Method of Selecting Outstanding General Practitioner: Your reference committee recommends approval of this resolution.

8. Resolutions on Activities of Veterans Administration: As the situation complained of does not obtain at the present time, your reference committee recommends that no action be taken.

9. Resolutions on Hospital and Medical Care for Veterans: Your reference committee recommends approval of these resolutions.

10. Resolutions on Washington Office of the American Medical Association: Your reference committee recommends approval of the first two parts of the resolutions, with the deletion of the third part.

11. Resolution on Life Insurance Fees: Your reference committee recommends that this matter be referred to the Bureau of Medical Economic Research for study.

12. Supplementary Report of Board of Trustees on Resolutions on Veterans Administration: A supplementary report

of the Trustees containing resolutions on the Veterans Administration supplements some of the statements previously reported. The reference committee approves adoption of the resolutions.

13. Resolution on Housing: One final matter came to your committee today from the delegate of the Oregon State Medical Society, which deals with the general housing situation and the dangers which can arise in other countries and might arise here, tending to socialization of people through housing plans of the federal government. While your reference committee is generally opposed to encroachment by the federal government into the field of private enterprise, it is not sufficiently informed on the proposed subject to recommend any action at this time.

Respectfully submitted,

Thomas A. McGoldrick, Chairman.
George A. Unfug.
Donald Cass.
Clark Bailey.
Charles L. Shafer.

Report of Reference Committee on Rules and Order of Business

Dr. H. P. Ramsey, Chairman, presented the following report:

All five members of the committee met on the question of the conduct of elections tomorrow, with the Secretary of the Association.

If you will refer to the Handbook, pages 38, 39 and 40, you will find the rules and the order of business for this session laid down. To these rules the reference committee adheres.

If you will look on page 40, no. 8, you will find a reference to "Roll Call for Casting Ballots"—that is ballots in the pleural. There will be one roll call for the casting of all three ballots as indicated at that point.

If you will refer to page 38, Title 4, which says "Election of Officers," at that point, this chairman will be glad to reinterpret this over again in case any members are not now present, to the following effect, that at the time nominations are to be opened the Secretary agrees to move the blackboard to the middle here, where it may be easily visible chiefly from the central portion of the room. That will be a good time for delegates to get as close to the front as possible.

At that time nominations will be taken for the white ballot. On this white ballot are places for your votes for the following officers: President-Elect, Vice President, Secretary, Treasurer, Speaker of the House, and Vice-Speaker of the House.

As these nominations are made, the Secretary will record the nominations on the blackboard in your full view. At the conclusion of all the nominations for the white ballot, the Speaker will be requested to announce that all nominations for officers appearing on the white ballot are in, and will request at that time that you inscribe your ballots as you please and put them in your pockets.

The Speaker asked if he is to declare nominations closed for each office or at the conclusion of all of them and Dr. Ramsey stated: The rule is to require each office closed as all nominations are in for that office, but at the conclusion of all, on the white ballot, for clarification, the Speaker will declare that all nominations for the white ballot are in, at which time you may inscribe the ballots and put them in your pockets. The same procedure will be then followed for the items which appear on the blue ballot which are for members of the Board ofTrustees and for the place of the annual session of this Association in 1951.

At the conclusion of that, the Speaker will be asked to notify you that the blue ballot nominations are all in. The same procedure will then be followed with respect to the yellow ballot which has places for members of the Judicial Council, members of the Council on Scientific Assembly, members of the Council on Medical Education and Hospitals, and members of the Council on Medical Service.

At the conclusion of all of that, there will then be one roll call. This is for the expedition of business.

The members may pass and drop their folded ballots all at once into the one ballot box.

At this point, Mr. Speaker, the committee has a special recommendation for you, namely, that there have been appointed by the Speaker three tellers. It is recommended by the reference committee that the committee have tellers assigned, one color to each of these members, and that the Speaker appoint two associates to each member, making a total list of tellers of nine, so that each section of the tellers' committee may count his color ballots simultaneously, thus further expediting the business of the House. If the Speaker will do that, this will not take much more than the length of time consumed by the actual roll call.

The Speaker asked if the three ballots were to be passed out simultaneously or whether in the beginning the white ballot would be passed out and then each in succession, and Dr. Ramsey replied that they would all be passed out at the same time and added:

One further point, and that concerns the matter of any offices for which there may be a recount. The same type of ballot will not be circulated. The Secretary will be requested to circulate a particular type of paper for recount ballots.

On motion of Dr. Ramsey, seconded by several and carried, the report of the reference committee was adopted.

Report of Reference Committee on Medical Education

Dr. W. D. Stovall, Chairman, presented the following report of the Reference Committee on Medical Education:

1. Report of Council on Medical Education and Hospitals: The Reference Committee on Medical Education has carefully reviewed the report of the Council on Medical Education and Hospitals as printed in the Handbook and the Supplementary Report of the Council, and is impressed by the number and variety of the problems dealt with by the Council.

Special attention is called to the survey of medical schools. During the course of the year the Council enlarged the survey of medical schools to include a survey of medical education in its broad aspects. The Council decided that the time is appropriate to reexamine the methods and objectives of medical education so that a clear view may be obtained of the extent to which medical education has been adapted to modern needs.

The Council was also concerned with the training of general practitioners and is encouraged by the number of medical schools already conducting programs to interest students in general practice. It is encouraged with the number of internship and residency programs being established to provide training for young physicians to enter general practice.

The Council gave considerable attention to the cost of medical education and, in studying this subject, it finds that exclusive of the costs of patient care and funds from outside sources, more than $43,000,000 was spent for the current academic year. Less than 28 per cent of this amount was provided from student fees. The urgency with which the Council views this matter is revealed by its action taken since publication of the Handbook in recommending that funds for medical education be obtained by public donation and that the American Medical Association and other interested groups form a national foundation for this purpose. This recommendation has been approved by the Board of Trustees.

The reading of this report shows that the Council has dealt vigorously with such problems as the supply of physicians, supply and distribution of interns and uniform intern placement. In the latter respect, the Council has suggested to medical schools and hospitals a plan for securing registration and placement of interns.

The forward looking activities of the Council are illustrated in its action concerning inspection of residency programs in hospitals. The Council collaborated in a review of all residencies in orthopedic surgery as a pilot experiment designed to evaluate the system employed by the Council in appraising residencies, and was pleased to find that the results of inspection by one of its own staff were in close agreement with those performed by selected orthopedic surgeons.

The Council established a liaison committee between the Advisory Board for Medical Specialties and the Association of American Medical Colleges, which meet three or four times a year to bring before these agencies the methods for satisfying their differences. This liaison committee "should be in a position to make constructive suggestions with respect to many of the general problems related to the specialty movement." These and many other activities portray the vigor with which the Council is making earnest and sincere efforts to solve the problems of medical education.

2. Supplementary Report of Council on Medical Education and Hospitals: The Supplementary Report of the Council on Medical Education and Hospitals has raised the question of the advisability of attempting the conditioning of approval of educational programs of medical schools and hospitals on the basis of financial agreements of such institutions with staff members.

The committee concurs with the Council in the opinion that such is unwise and possibly illegal.

3. Resolutions on Hospitals and Medical Schools Engaging in the Practice of Medicine: The committee feels that the resolutions submitted by the Missouri State Medical Association can be more appropriately handled by the Committee on Hospitals and the Practice of Medicine, the chairman of which is Dr. Elmer Hess of Pennsylvania. The committee recommends that these resolutions be referred to that committee.

4. Report of Committee on Intern Placements: The Report of the Special Committee on Intern Placements, of which Dr. William Bates of Pennsylvania is chairman, was considered by the reference committee. It was noted that this special committee was appointed by the Speaker of the House at the request of the House at its session in January 1948, to study the supply and distribution of interns.

The reference committee recommends the adoption of this report with commendations to this special committee for the amount of work which it put into this investigation and its excellent recommendations.

5. Resolutions on Medical Education: The resolutions introduced by Dr. S. J. McClendon, California, concerning the subsidizing of medical education and medical students by the federal government, and the report of the Committee for the Improvement of Child Health of the American Academy of Pediatrics recommending federal support for pediatric education, were discussed by a large group before the reference committee. The committee is unanimous in its disapproval of the federal government's subsidizing medical education, and in view of the fact that the Council on Medical Education and Hospitals took the following action on last Sunday, the committee recommends that the Council's statement be substituted for the resolution introduced by Dr. McClendon:

> The Council has gone on record favoring an intensive effort to secure voluntary support for medical education. Therefore, the Council is opposed to the plan of the American Academy of Pediatrics. The Council feels that it is extremely unwise for one specialty in medicine to seek federal support before medicine and medical education in general have approved this principle.

6. Resolution on Bureau of Health Education: The resolution introduced by New Jersey recommending the change in name of the Bureau of Health Eucation to the Bureau of Child Health and Health Education seems unnecessary to the Reference Committee. Since health education is an all-inclusive term, the committee recommends that the name of the Bureau be retained as it is. This resolution is therefore not approved.

7. Resolution on Review of Hospital Standardization: This resolution, offered by the Oregon State Medical Society, asking the Council on Medical Education and Hospitals to authorize and direct a study for more inclusive standards for hospitals, deals with a subject which is now under consideration by the Council on Medical Education and Hospitals. The Council is actively engaged in the promulgation of such standards. Therefore, your committee recommends that this resolution be referred to the Council on Medical Education and Hospitals for further guidance.

8. Resolution on Method of Selecting Each Year the Outstanding General Practitioner of American Medical Association: The resolution introduced by the Illinois State Medical Society provides for the selection of the outstanding general practitioner of the year. It recommends that each county society recommend to its state society the name of the candidate of its choice as the outstanding practitioner, and that the state societies submit a candidate in turn to the Board of Trustees of the American Medical Association. The Board of Trustees shall select three names which will be submitted to the House of Delegates for its selection of the outstanding practitioner of the year. The resolution further provides that state medical societies may confer awards with fitting public ceremony on the physician of their choice. The committee approves this resolution.

On motions of Dr. Stovall, duly seconded and carried, the first seven sections of the report of the reference committee were adopted.

Dr. Stovall moved adoption of the report of the reference committee dealing with the Resolution on Method of Selecting Each Year the Outstanding General Practitioner of the American Medical Association, but after discussion concerning action on the resolution by another reference committee presented a substitute motion that this section of the report be not received, which was adopted.

On motion of Dr. Stovall, seconded by several and carried, the report of the reference committee was adopted as a whole.

On motion of Dr. G. V. Caughlan, Iowa, seconded by Dr. H. B. Everett, Tennessee, and carried, the House recessed at 12:25 p. m., to reconvene at 2 p. m.

Wednesday Afternoon

The House of Delegates reconvened at 2:15 p. m., with Dr. R. W. Fouts, the Speaker, presiding.

Discharge of Committee to Study Revision of the Constitution and By-Laws

The Speaker stated that after the adoption of the revised Constitution and By-Laws, nothing was said about discharging the committee.

It was moved by Dr. Walter E. Vest, West Virginia, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, that the Committee to Study Revision of the Constitution and By-Laws be discharged.

Appointment of Committee to Edit and Prepare for Publication the Revised Constitution and By-Laws

The Speaker appointed Dr. F. F. Borzell, Philadelphia, Dr. Joseph D. McCarthy, Omaha, and Dr. Louis A. Buie, Rochester, Minn., members of the Committee to Edit and Prepare for Publication the Revised Constitution and By-Laws.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. W. P. Anderton, Chairman presented the following report:

REPORT OF BOARD OF TRUSTEES

Your committee notes the increased expenditures which exceeded income by $50,827.55. Although mindful of increasing expenses, the committee expresses concern over this deficit and recommends that the House of Delegates be informed of the prospects of subsequent deficits and the proposed plans for meeting them, if they occur.

After meeting with the Chairman of the Board of Trustees, the committee is prepared to inform the House in some degree of the budget as follows:

First, the Centennial Meeting of the Association produced extraordinary expenses, especially for the entertainment of distinguished foreign guests. Also, salary increases, increased costs of materials, extended field work and regional meetings by the Councils have added to expenses. In order to meet the anticipated increase of operating expenses, the advertising rates in our publications have been increased, and at the last Interim Session the Fellowship dues were raised from $8 to $12 a year. With due regard to these facts, the Trustees believe that a deficit will be avoided in 1948. However, we feel that this House should be aware that each time we create a new committee or new council we are in effect increasing expenditures.

Your reference committee reads with gratifying interest the achievements of the editorial boards and business management of the publications and expresses justifiable pride in the results. It furthermore commends the work on the publication of

Standard Nomenclature. Your reference committee, as have similar committees in the past, commends the editorial boards for their success in publishing special periodicals of excellent quality. It believes that the publishing of books by contract with outside, well established publishing concerns has been satisfactory.

It notes the financial loss from the publication of *Hygeia.* It believes, however, that *Hygeia* is an important magazine in its field and is justified, even at a loss. As has been said before, *Hygeia* is a vehicle for spreading accurate information on health matters and should be a messenger of good will from the American Medical Association. It is hoped that work on the Directory may go forward with increasing speed.

The work of the Library gives aid of inestimable value to the profession, and particularly to our colleagues in foreign lands —work which the committee believes should be encouraged and well supported. The same may be said of the Quarterly Cumulative Index Medicus.

The committee feels that the Cooperative Medical Advertising Bureau has improved its efficiency since its reorganization and it deserves commendation.

The reports of the councils and laboratories indicate, as they have in the past, the abundance and excellence of their diversified accomplishments. The committee recommends that some method of furnishing information on the work of the councils and laboratories to the rank and file of the membership be studied. Your committee believes that information about the accomplishments of these departments of the Association gains for the Association improved understanding and cooperation from the membership.

Council on Industrial Health: Your reference committee has reviewed the report of the Council on Industrial Health. It contains no specific recommendations requiring action of the House, nor recommendations to the House from this reference committee. We commend particularly the promotion of health services for small industrial plants and small business concerns. We note with approval the joint study of the Council on Industrial Health and the Council on Pharmacy and Chemistry on the prevention and treatment of silicosis by means of aluminum.

Bureau of Health Education: In reviewing this splendid report your committee finds no recommendations requiring action of the House.

Bureau of Legal Medicine and Legislation: (*a*) Local Public Health Units: The Bureau calls attention to U. S. Senate Bill 2189 providing funds to assist the states in providing for local public health units. This bill has the approval of the organized State and Territorial Health Officers and the National Congress of Parents and Teachers. To the extent that the bill will provide federal aid in development of local health units, it conforms to policies adopted by our House of Delegates. Attention should be directed, however, to the fact that the bill as now phrased gives no assurance that local health departments will not provide care for the sick. S. 2189 should be amended by adding a definition of basic public health function, and definitely to exclude care of the sick. Should this be done the legislation would, in principle, conform to policies adopted by this House of Delegates.

(*b*) Inequities of Income Structure—Pension Plans for Physicians: Considering in detail the discussion in the report concerning the inequities in the income tax structure as related to physicians, the committee would recommend that this House of Delegates record its thanks for the action of the Board of Trustees wherein the Board recorded its approval, in principle, of the proposal that physicians as small proprietors, or as partners, be permitted deduction of costs in computing income taxes to formulate pension programs for themselves, provided a reasonable ceiling be placed on the amount of pension. The committee recommends that the Bureau of Legal Medicine and Legislation keep in close contact with this development and report further at future meetings.

(*c*) Epilepsy and Automobile Accidents—Drunken Drivers: It is recommended that the Committee to Study Problems of Motor Vehicle Accidents created by the House of Delegates in 1936 continue its efforts in cooperation with the National Safety Council, especially in the matter of assisting states to adopt laws requiring that names of epileptic persons be furnished to each state motor vehicle department. Furthermore, we feel that the Bureau should continue to stress the value of chemical tests for alcoholic intoxication.

(*d*) Medical Legal Aspects of Artificial Insemination: Inquiries have developed from many sources regarding the status of a child born after artificial insemination. The primary interest as reflected by these inquiries has to do with the legitimacy of the offspring when the donor is a person other than the husband of the woman inseminated. Many medical-legal aspects of this type of situation have been created and the answer is not clear, in view of several court decisions. We recommend that this House of Delegates endorse, in principle, enactment of legislation designed to legitimize children born after this manner.

(*e*) The Medical Examiner: It is noted with considerable interest that the coroner-medical examiner system is gradually replacing the old coroner system. Particular attention is called to the accomplishments in Virginia, while the medical examiner laws have also been improved in Maine, New Hampshire and New Jersey. Your committee wishes to reemphasize the previous pronouncements of this House in favor of the medical examiner system to replace the antiquated coroner system.

The Bureau of Legal Medicine also discusses in its report the bills introduced in several states designed to prohibit use of animals for medical research. It is gratifying to note that none of these bills passed in 1947. Several states, on the contrary, passed laws or strengthened preexisting laws specially recognizing the need for utilization of animals in continuing medical research. Your committee wishes to endorse the action of the National Society for Medical Research in sponsoring legislation in the various states for the protection of medical research.

Bureau of Exhibits: We note with approbation the report of the Bureau of Exhibits and the splendid scientific and technical exhibits at both the interim and annual sessions. These exhibits speak for themselves and are of inestimable educational value.

Bureau of Medical Economic Research: Your committee has reviewed the excellent report of the Bureau of Medical Economic Research and finds no recommendations that require action by this House. We know of the fine work this Bureau has been doing and we commend its usefulness and practical help to our professon.

Bureau of Industrial and Personnel Relations: Your committee reviewed the comprehensive report of the Bureau of Industrial and Personnel Relations. It shows that accepted business practices are applied in the administration of the American Medical Association.

Committee on Scientific Research: This committee shows in its financial statement that $14,680 was paid in grants for scientific research in 1947. Its detailed report shows the magnitude and ramifications of the investigations which it encourages. Your reference committee recommends to this House that it advocate to the Board of Trustees the continuance of support for such valuable activities, including those under the auspices of the Committee on Therapeutic Research of the Council on Pharmacy and Chemistry.

SUPPLEMENTARY REPORTS OF THE BOARD OF TRUSTEES

1. Revision of National Health Program: This reference committee notes the rewording of point 7 in the National Health Program and recommends adoption of the following revision: "7. The veteran shall be entitled to the highest available quality of medical care in accordance with existing laws, and preferably in his own community with a physician and hospital of his own choice."

2. World Medical Association: Dr. Elmer L. Henderson, Chairman of the Board of Trustees, read to this House an interesting and informative account of the part played by our representative in the formation of the World Medical Association. The reference committee commends the vision and ability of the Board of Trustees in this matter. It congratulates the World Medical Association on its good sense in electing Dr. Louis H. Bauer to be Secretary-General.

3. Cooperation with the Secretary of the Interior: This reference committee has reviewed the report of the Trustees concerning the consultant medical teams which the Department of

Interior sent to Puerto Rico and the Virgin Islands, Alaska, and the Navajo Indians. It commends this action of the Board of Trustees.

4. Merger of the Committee on Rural Medical Service With the Council on Medical Service: Your reference committee has considered the recommendation that the Committee on Rural Medical Service be merged with the Council on Medical Service,. and your reference committee recommends that the following be substituted for this recommendation:

Amend Chapter X, Section 4 (A) of the By-Laws by adding: "5. Council on Rural Health and Medical Care."

Amend Chapter X, Section 4 (B) of the By-Laws by adding the following paragraph:

"The Council on Rural Health and Medical Care shall consist of nine members appointed by the Board of Trustees, with the Secretary and a member of the Board of Trustees as exofficio members. To the original membership of the Council, two members shall be appointed for a term of one year, two members for terms of two years, two members for terms of three years, two members for terms of four years and one member for a term of five years. Thereafter members shall be appointed for a term of five years."

Amend Chapter X by adding the following new paragraph under "I. Duties":

"(5) Council on Rural Health and Medical Care.—The functions of this Council shall be: (1) to study the needs of the rural population with regard to health and medical care in their broadest aspects; (2) to promote cooperation with all individuals and organizations interested in the rural health problem; (3) to stimulate a program of education among rural people and rural physicians concerning all the factors involved in the rural health problem; (4) to exercise closest cooperation with the Board of Trustees and with all councils, bureaus and committees of the American Medical Association in the furtherance of the functions of this Council; and (5) to develop and assist committees on rural medical service originating within the constituent and component societies of the American Medical Association."

5. Conclusion: It is difficult for this reference committee properly to phrase the debt of gratitude which is owed to the Board of Trustees by this House of Delegates, the American Medical Association and the entire people of the United States. The unselfish and self-sacrificing devotion of these gentlemen brings its own reward in the knowledge of a job well done.

Respectfully submitted,

W. P. Anderton, Chairman.
Thomas A. Foster.
Warren L. Allee.
Jesse D. Hamer.
Herman A. Lawson.

On motions of Dr. Anderton, duly seconded and carried, the report of the reference committee was adopted section by section and as a whole, with the exception of Section 4, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws, and after deletion of a paragraph referring to the Red Cross Blood Bank Program. Dr. Louis H. Bauer, Trustee, suggested that if the proposed amendment to the By-Laws is adopted, the article in the By-Laws pertaining to the Council on Medical Service would also have to be amended.

Report of Committee on Hospitals and the Practice of Medicine

Dr. Elmer Hess, Chairman, presented the following report:

As you all know, the Board of Trustees appointed a special committee, of which I happen to be the Chairman, to study this problem of the hospitals practicing medicine. Your committee has had many meetings since this House has been in session, and this morning resolutions from Missouri were referred to our committee. I rather questioned whether these resolutions could be referred to us because we are not at the moment a committee of this House.

On the other hand, I should like to call your attention to something which I think you should know, and that is this, that so far as your committee can find out, the American Medical Association has no police power and it cannot discipline anybody or anything, and in the resolutions this morning you have asked us to recommend to the Board of Trustees that we discipline medical schools and hospitals. We have no such authority legally. Your committee is having a difficult time trying to find out what we can do to put teeth into our actions toward organizations and individuals which do not comply with the broad terms of our Principles of Medical Ethics. But I want you to know and understand that the American Medical Association per se has no police power.

Report of Reference Committee on Medical Education

Dr. W. D. Stovall, Chairman, presented the following report:

1. Resolution on Cancer Detection Centers: Your reference committee approves of this resolution.

2. Resolution on Membership on Council on Medical Education and Hospitals: Your Reference Committee on Medical Education, mindful of the fact that two vacancies will occur on the Council on Medical Education and Hospitals at this session, suggests that this House of Delegates request that the nominees by the Board of Trustees for one of these vacancies be limited to private practitioners of medicine not on the faculty of nor connected with any institution associated with any medical college or university.

3. Resolutions on Shortage of Interns: Your Reference Committee recommends adoption of the following resolutions:

Whereas, The community hospital is confronted with a critical problem "a shortage of interns"; and

Whereas, Without interns, the community hospital is seriously handicapped; and

Whereas, The American Medical Association is attempting to encourage its members to administer the best medical care possible to the sick; and

Whereas, The larger hospitals are now obtaining the greater percentage of the medical graduates as interns; and

Whereas, An intern who completes his training in a community hospital is well equipped for the general practice of medicine; and

Whereas, By our present day practices we are reducing the number of general physicians; therefore be it

Resolved, That in order to preserve the general practice of medicine, the American Medical Association institute a program to limit the number of interns of all approved hospitals on an equal basis according to yearly admissions, and be it further

Resolved, That this be referred to the Council on Medical Education and Hospitals for consideration.

Respectfully submitted,

W. D. Stovall, Chairman.
Joseph H. Howard.
J. D. McCarthy.
Joseph F. Londrigan.

On motions of Dr. Stovall, duly seconded and carried, the first two sections of the report of the reference committee were adopted.

Dr. Stovall moved adoption of the Resolutions on Shortage of Interns, and the motion was seconded. After discussion, the resolutions, on motions, duly made, seconded and carried, were amended so as to substitute the word "allocate" for the word "limit" so that the first part of the resolutions will read: "*Resolved*, That in order to preserve the general practice of medicine, the American Medical Association institute a program to allocate the number of interns of all approved hospitals on an equal basis according to yearly admissions."

On motion of Dr. Stovall, duly seconded and carried, the report of the reference committee as amended was adopted as a whole.

Report of Reference Committee on Sections and Section Work

Dr. Robertson Ward, Chairman, presented the following report, which was adopted on motion of Dr. Ward, seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and carried:

The only business referred to this committee was the report of the Council on Scientific Assembly, on pages 187, 188 and 189 of the Handbook.

At the close of this report, a suggestion was made that instead of each section being represented by a delegate in the House of Delegates, as is now the case, there be formed a scientific representative assembly of Section delegates, and that this body elect a maximum of five delegates to represent the Sections. It is the consensus of the reference committee that since the House of Delegates is now operating under the new Constitution and By-Laws, which does not limit the number of delegates of which the House consists, the reason for this suggestion no longer exists.

The reference committee further recommends that the Sections be represented by an elected delegate, as is now in vogue.

Respectfully submitted,

Robertson Ward, Chairman.
A. S. Giordano.
Leo G. Christian.
Charles T. Stone.
Edward L. Compere.

Report of Reference Committee on Medical Service and Prepayment Insurance

Dr. H. B. Mullholland, Chairman, presented the following report, which, on motion of Dr. Mullholland, duly seconded and carried, was adopted section by section and as a whole after discussion:

1. Several Resolutions Referring to Current Health Insurance Coverage of Employees of the American Medical Association: Your committee considered the several resolutions referred to it pertaining to the current health insurance coverage of the employees of the American Medical Association. Your committee also considered the evidence presented to it by the official representatives of the American Medical Association, House of Delegates and others.

Your committee is of the opinion that because the American Medical Association has sponsored and encouraged the development of nonprofit voluntary prepayment hospitalization and medical service plans that the discontinuance of Blue Cross Hospital Service for its employees has reacted unfavorably to the nonprofit voluntary prepayment hospital and medical service philosophy and, likewise, unfavorably to the interest of plans developed by the various state and county medical societies throughout the country.

However, your committee is of the opinion that circumstances and conditions prevailing at the time the present insurance contract was entered into were such that this action was thought to be in the best interests of the employees of the American Medical Association.

Your committee recommends because of the above-stated opinions that at the expiration of the present contract of hospital and medical health coverage the American Medical Association, through its proper officials, make every sincere effort to procure this coverage for its employees through Blue Cross-Blue Shield local organization. The committee understands that this coverage is and will be available.

2. Report of Committee on Nursing Problems: Your committee has considered the report of the committee appointed to study the nursing problem of the United States. It would especially commend the members of this committee for the tremendous volume of work done and the excellency of the report submitted.

The recommendations with reference to the classification of nurses, namely into (*a*) professional nurses with a subdivision of (1) nurse educators and (2) clinical nurses; and (*b*) trained practical nurses has the full approval of this committee, and it would like to emphasize the importance of creating opportunity for advancement one grade to the other in the various categories.

It would also call especial attention to the paragraph pertaining to the economic problems affecting nurses.

The committee agrees that it would be most unwise for groups of nurses to set themselves up as bargaining agents. It would heartily concur in the recommendation for the continuance of this committee. It would suggest that copies of the nursing committee report be sent to all hospital associations, the American Nurses Association, the National League for Nursing Education, the American College of Surgeons, the American Surgical Association and the American College of Physicians, and that the widest possible publicity be given to this report.

3. Report of Committee on Rural Medical Service: The committee approves the report of the Committee on Rural Medical Service and highly commends it on the splendid progress already made in its three years of work. The members have given unsparingly of their time from their busy practice to this work. The increasing interest of foreign groups in community health matters and their need for guidance in these activities has created a need for a field secretary which has already been authorized by the Board of Trustees. It is hoped that this addition to the committee's personnel will relieve the members of much arduous work and enable them to carry their influence deeper into the rural areas.

4. Resolution on Discrimination Against Insurance Industry of This Country: Your committee has considered the resolution of the Rhode Island Medical Society with reference to the requirements of a one year period of operation for plans underwritten by private insurance carriers before such plans can be formally considered for the seal of acceptance, and recommends that this resolution be referred to the Council on Medical Service for its consideration.

Respectfully submitted,

Henry B. Mulholland, Chairman.
H. G. Hamer.
Stephen E. Gavin.
D. A. Rhinehart.
L. Howard Schriver.

Attendance at Executive Session

Dr. E. Vincent Askey, California, raised the question of limiting attendance at the Executive Session to members of the House and moved that the House reconsider the action of the House during the morning as to who should be admitted to Executive Session. The motion was seconded by Dr. William Weston, Section on Pediatrics, and, after discussion, the House voted to reconsider its action.

Dr. Askey then moved that the Executive Session of the House shall consist of members of the House of Delegates only. The motion was seconded and carried after the Vice Speaker read Article VI, Section 2 of the Constitution stating of whom the House of Delegates is comprised.

Proposed Amendment to By-Laws Chapter X, Section 4 (B)

Dr. Hilton S. Read, New Jersey, presented the following proposed amendment to the By-Laws, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

It is recommended that Chapter X, Section IV (B) Standing Committees—Membership, of the By-Laws as adopted by this House yesterday which now reads "The Council on Medical Education and Hospitals shall consist of seven members elected by the House of Delegates on nomination by the Board of Trustees for terms of seven years so arranged that at each annual session the term of one member expires" shall be amended to read:

"The Council on Medical Education and Hospitals shall consist of seven members or Service Fellows one of whom shall be a private practitioner of medicine not a faculty member of a medical school and not a member of a staff of a hospital associated with a medical school or university, elected by the House of Delegates on nomination of the Board of Trustees for seven years so arranged that at each annual session the term of one member expires."

Resolution on Executive Sessions

Dr. James C. Sargent, Wisconsin, presented the following resolution, which was referred to the Reference Committee on Rules and Order of Business:

Whereas, The interests of the constituent state and territorial associations of the American Medical Association are identical with those of the American Medical Association; and

Whereas, The constituent state and territorial medical associations elect or employ officers and executives whose loyalty to their associations is unquestioned; and

Whereas, The constituent state and territorial medical associations, at their own expense, send their officers and executives to the meetings of the American Medical Association; therefore be it

Resolved, That the policy of the House of Delegates of the American Medical Association shall be that executive sessions of the House of Delegates shall include among those permitted to remain in attendance all registered delegates, all registered alternate delegates, all properly registered and identified presidents, secretaries, editors and executive secretaries of the constituent state and territorial medical associations, and the heads of Councils, Bureaus and Committees of the Association, with the understanding that this policy may be set aside or restricted when in the judgment of the House of Delegates such a change shall be deemed desirable.

On motion of Dr. Robert H. Hayes, Illinois, seconded by Dr. Val H. Fuchs, Louisiana, and carried, the House went into Executive Session at 3:30 p. m.

Executive Session

The House of Delegates convened in Executive Session at 3:40 p. m., with the Speaker Dr. R. W. Fouts, presiding.

Report of Reference Committee on Miscellaneous Business

Dr. E. S. Hamilton, Chairman, presented the following report, which was adopted unanimously on motion of Dr. Hamilton, seconded by Dr. James R. Reuling, New York, and carried.

REPORT AND RESOLUTION DEALING WITH THE RED CROSS BLOOD BANK

Your reference committee had referred to it that portion of the report of the Board of Trustees in regard to blood banks as well as several resolutions in regard to the same subject. It has reviewed and studied all carefully and held several committee meetings with excellent attendance at which every man present had the opportunity of free discussion. Your reference committee feels that it is unnecessary to consider each resolution individually and much more important to view the problem on a broad national basis and attempt to outline some general principles in regard thereto.

Realizing the possibility of a national emergency requiring large amounts of blood in the treatment of civilian and military casualties and realizing the unique position of the American Red Cross in disaster relief, your committee is of the opinion that no change should be made at this time in the "approval in principle" of the participation of the American Red Cross in the national blood program voted at the Interim Session in January 1948.

However, your committee would call attention of the House to the fact that long before the Red Cross entered this field of medical practice many previously established blood banks had been operating successfully and adequately under strictly local supervision and had rendered invaluable services to the community. To disturb such independent local units would, in the opinion of your committee, be unwise and disastrous, for they have repeatedly demonstrated their ability to meet local and regional needs. Furthermore, they have demonstrated the practicability of free enterprise and local initiative.

From the testimony presented at the several hearings before your reference committee, it is quite evident that there has been confusion and misunderstanding between local chapters of the Red Cross and the medical profession at local levels.

It is the opinion of your reference committee that the "Approval in Principle" be construed as follows:

First, local control must be by the county medical society.

Second, the local medical society should be the initial contact in the contemplation of inauguration of a new blood bank.

Third, no publicity nor news releases shall be released except by mutual consent of the local county medical society and the local chapter of the American Red Cross.

Fourth, difference of opinion in establishment or operation of a blood bank in either administrative or technical detail shall be arbitrated at state levels by joint committees from the state medical society and the American Red Cross.

Recognizing the professional ability of the physicians constituting the Advisory Committee of the national American Red Cross and the efforts they have made in behalf of this program as well as the efforts of a similar committee approved by the House of Delegates of the American Medical Association in January 1948, your reference committee feels that this intimate cooperation should be continued. However, it is also the feeling of your committee that in a program of such national importance, even greater effort and cooperation is needed in the future to attain desired objectives. Accordingly, it recommends that the committee of the American Medical Association be enlarged to nine members with definite instructions to meet at stated intervals at the call of either the chairman of our committee or that of the Red Cross. The committee of the American Medical Association so appointed shall report to the House of Delegates at each session.

Your reference committee feels that any provision of free medical service or supply to everyone without regard to ability to pay is in opposition to the principle that it is the responsibility of an individual to assume the obligations of medical expense just as he does for other living expense. Your reference committee deplores the use of the term "free blood" in the publicity of the American Red Cross.

Respectfully submitted,

Edwin S. Hamilton, Chairman.
Charles R. Rountree.
J. H. Moore.
Thomas M. Brennan.
Claude R. Keyport.

Report of Reference Committee on Executive Session

Dr. Charles H. Phifer, Chairman, presented the report, which was adopted, section by section and as a whole after discussion on motions of Dr. Phifer, duly seconded and carried after amendment of the first section. The report as amended reads as follows:

1. Report of the Council on National Emergency Medical Service: This report of the Council on National Emergency Medical Service deals with the conservation and constructive utilization of the medical manpower of this nation in the event of a national emergency. Your reference committee has carefully reviewed pages 80-92 of the report in the Handbook and the supplementary report of the Council on National Emergency Medical Service. It desires to commend this Council for its meticulous and excellent report. It appreciates the tremendous amount of time, energy, planning and constructive work done by the various members of this Council as well as the careful study and thoughtful evaluation of this very important question. It recommends the adoption of this section of the report, taking into consideration the changes presented by the Reference Committee on Emergency Medical Service and approved by the House.

2. Supplementary Report of the Council on National Emergency Medical Service: Your Reference Committee recommends adoption of the portion of the Supplementary Report of the Council on National Emergency Medical Service containing a resolution urging the President of the United States and the Chairman of the National Security Resources Board to take action for the immediate establishment of a Civilian Medical Coordinating Board as a functioning part of the National Security Resources Board.

3. Committee on Medical and Hospital Services of the Armed Forces: Your committee recommends the adoption of that portion of the Supplementary Report of the Council on National Emergency Medical Service which contains a resolution commending the Secretary of National Defense for his appointment of a committee on Medical and Hospital Services of the Armed Forces and urging him to establish a permanent Medical Advisory Board.

4. Resolution on calling Civilian Personnel into the Armed Forces: Your committee recommends adoption of the part of the Supplementary Report of the Council on National Emergency Medical Service which contains a Resolution on Calling Civilian Personnel Into the Armed Forces.

5. Resolution on Continuation of Graduate Medical Training Program: Your reference committee recommends the adoption of the portion of the Supplementary Report of the Council on National Emergency Medical Service containing a Resolution on Continuation of Graduate Medical Training Program.

Respectfully submitted,

Charles H. Phifer, Chairman.
George Braunlich.
A. A. Walker.
Raymond L. Zech.
Walter F. Donaldson.
George P. Johnston.
W. A. Coventry.

During the reading of the report the Vice Speaker, Dr. F. F. Borzell took the Chair.

The Secretary asked the House what its desire was as to giving publicity to its action on the Red Cross Blood Bank. It was moved by Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. James R. Reuling, New York, and carried, that the report on the Red Cross Blood Bank be released for publication in the wisdom of the Public Relations Department.

On motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. Val H. Fuchs, Louisiana, and carried, the House rose from Executive Session at 4:05 p. m.

Wednesday Afternoon — Continued

The House convened in regular session at 4:05 p. m., with Dr. F. F. Borzell, Vice Speaker, in the Chair.

Report of Reference Committee on Miscellaneous Business

Dr. E. S. Hamilton, Chairman, presented the following report:

1. Resolutions on Specialty Boards: Resolutions were presented by Dr. Edward Flood. After careful consideration of these resolutions, your reference committee is of the opinion that they should also be referred to the Committee on Hospitals and the Practice of Medicine of which Dr. Elmer Hess is chairman.

2. Resolutions on Paying Physicians Engaged in Examinations for Armed Forces: Your committee recommends the adoption of these resolutions.

3. Resolutions on Closer Integration of Medical Services of Army, Navy and Air Force: Your reference committee has revised these resolutions and in view of the studies now under way in this regard recommends their approval:

Whereas, It is apparent that a much closer integration of the medical services of the Army, Navy and Air Force would lead to greater efficiency, increased economy and a higher level of medical care; and

Whereas, Studies of means and methods of this integration have been undertaken by certain agencies or committees of the government; and

Whereas, It is believed that these studies should be developed with the greatest possible speed consistent with sound planning; therefore be it

Resolved, That the House of Delegates of the American Medical Association is heartily in favor of this integration; and be it further

Resolved, That the House of Delegates of the American Medical Association requests that the President of the United States and the Secretary of National Defense develop immediately ways and means to further this integration; and be it further

Resolved, That a copy of these resolutions be sent to all members of the Armed Services Committee of both the Senate and House of Representatives.

4. Report of the Joint Committee for the Coordination of Medical Activities: Your reference committee has reviewed this report and commends it as a report of progress and recommends that the committee continue its activities.

5. Resolutions on American Physicians' Art Association: Your reference committee expresses its warm approval of these resolutions and moves that they be adopted.

6. Resolution on Funds to Defray Expenses of the Woman's Auxiliaries of the States: Your reference committee is of the opinion that, since this resolution has to do with finances, it should be referred to the Board of Trustees.

7. Resolution on Compulsory Cash Sickness Compensation: It is the opinion of your reference committee that this resolution should be referred to the Board of Trustees for reply.

8. Resolutions on Hospital Exploitation of Medical Services, and Resolution on Approval of Hospitals: While the contents of these two resolutions are somewhat dissimilar, it is the opinion of your reference committee that they fall in practically the same category and are related to a subject which is now under investigation by a special committee appointed by the Board of Trustees following the last Interim Session to investigate the practice of medicine in hospitals. This committee is under the chairmanship of Dr. Elmer Hess of Pennsylvania, and your committee is informed that it is holding meetings on this subject frequently during this annual session. Accordingly, your reference committee recommends that these two resolutions be referred directly to the Committee on Hospitals and the Practice of Medicine, of which Dr. Elmer Hess is chairman, for its investigation and further study. The problems involved can be reported to the Board of Trustees by said committee and then considered by the House of Delegates if considered desirable.

9. Resolutions on Single Examination Acceptable to Armed Forces: Your reference committee has carefully reviewed these resolutions. There is some difference of opinion regarding the number of examinations that might be necessary in any individual case in arriving at the proper decision as to the availability of an individual for military service. While apparently in World War II many reexaminations of candidates were made, your committee cannot feel that a single examination will always be sufficient. Accordingly, it recommends that the House of Delegates should not restrict the powers of government agencies in setting up rules and regulations in regard to examination of candidates. The number of examinations in any case must necessarily be decided on an individual basis.

With these exceptions the committee recommends the adoption of these resolutions.

Respectfully submitted,

Edwin S. Hamilton, Chairman.
Charles R. Rountree.
J. H. Moore.
Thomas M. Brennan.
Claude R. Keyport.

Dr. Hamilton moved adoption of the section of the report of the reference committee recommending reference of the Resolutions on Specialty Boards to the Committee on Hospitals and the Practice of Medicine, and the motion was seconded by Dr. Val H. Fuchs, Louisiana, and carried.

It was moved by Dr. Hamilton, seconded by several and carried, that the House adopt the Resolutions on Paying Physicians Engaged in Examinations for Armed Forces.

Dr. Hamilton moved that the report of the reference committee approving the Resolutions on Closer Integration of the Medical Services of Army, Navy and Air Forces be adopted and the motion was seconded by Dr. Arthur J. Bedell, Section on Ophthalmology. After discussion by Dr. George E. Armstrong, United States Army, and Dr. E. Vincent Askey, California, Dr. J. F. Londrigan, New Jersey, moved that the matter be laid on the table. The motion to lay on the table was seconded by several and carried.

The section of the report of the reference committee commending the report of the Joint Committee for the Coordination of Medical Activities was adopted on motion of Dr. Hamilton, seconded by several and carried.

Dr. Hamilton moved that the section of the report of the reference committee recommending adoption of the Resolutions on American Physicians' Art Association be adopted, and the motion was seconded by Dr. E. Vincent Askey, California, and carried.

Dr. Hamilton moved that the House approve of the report of the reference committee referring to the Board of Trustees the Resolution on Funds to Defray Expenses of the Woman's Auxiliaries of the States. The motion was seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and was lost after discussion by Dr. E. Vincent Askey, California, and the Vice Speaker.

Dr. Askey then moved adoption of the Resolution on Funds to Defray Expenses of the Woman's Auxiliaries of the States and the motion was seconded by several and carried.

On motion of Dr. Hamilton, seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and carried, the report of the reference committee referring to the Board of Trustees for reply the Resolution on Compulsory Cash Sickness Compensation was adopted.

It was moved by Dr. Hamilton and seconded that the report of the reference committee referring to the Committee on Hospitals and the Practice of Medicine, of which Dr. Elmer Hess is chairman, the Resolutions on Hospital Exploitation of Medical Services and the Resolution on Approval of Hospitals be adopted. After an amendment was adopted on motion of Dr. James P. Kerby, Utah, seconded by several and carried that the Board of Trustees bring in a report at the next Interim Session, a motion to adopt the report as amended was carried.

It was moved by Dr. Hamilton, seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and carried after discussion by Dr. Hamilton that the report of the reference committee on the Resolutions on Single Examination Acceptable to Armed Forces be adopted.

On motion of Dr. Hamilton, seconded by Dr. Charles H. Phifer, Illinois, and carried, the report of the reference committee as amended and deleted was adopted as a whole.

Permission to Publish Report of Reference Committee on Executive Session Dealing with National Emergency Medical Service

On motion of Dr. Charles H. Phifer, Illinois, seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and carried, permission was granted for publication of the Report of the Reference Committee on Executive Session Dealing with National Emergency Medical Service.

The House recessed for fifteen minutes and was then called to order by the Speaker, who resumed the Chair.

Report of Reference Committee on Rules and Order of Business

Dr. Herbert P. Ramsey, Chairman, presented the following report, which was adopted on motion of Dr. Ramsey, seconded by Dr. E. Vincent Askey, California, and carried:

The Reference Committee on Rules and Order of Business has considered the resolution submitted to it with respect to the executive session and by majority vote recommends that in view of the fact that the House only yesterday adopted a By-Law, Division Three, Chapter IX, Section 3 (C) covering this matter, reconsideration at this time is premature.

The House recessed at 5:00 p. m., to reconvene at 1:00 p. m.,

---

Fourth Meeting—Thursday Afternoon, June 24

The House of Delegates convened at 1:40 p. m., in the Red Lacquer Room of the Palmer House, Chicago, with the Speaker, Dr. R. W. Fouts, presiding.

Report of Reference Committee on Credentials

Dr. G. Henry Mundt, Chairman, reported that there were 173 delegates seated and that the members of the committee were very anxious to contact the delegate from Puerto Rico if he be present.

Minutes

On motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, the House dispensed with the reading of the minutes.

Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr. Arthur J. Bedell, Chairman, presented the following report:

1. Proposed Amendment to By-Laws, Chapter X, Section 4 (A).

The Reference Committee on Reports of Board of Trustees and Secretary made a report on a resolution relating to the merger of the Committee on Rural Medical Service with the Council on Medical Service which has been presented to the House.

In its consideration of this problem, your reference committee finds that, if the formation of a new council is approved, there would follow the necessity for a further change in the Constitution relative to the Council on Medical Service.

It is the considered opinion of your reference committee that the development of a new council is one that merits and demands the very careful consideration of this House. Your committee feels that it has not had time to explore this problem as fully as its importance demands. Your committee is deeply appreciative of the wonderful contribution that the activities of the Committee on Rural Medical Service have made to organized medicine and is convinced that nothing should be done which might lessen their efficiency in the future.

Your reference committee further feels that, in view of the fact that Dr. Borzell's committee has worked for many months compiling a new Constitution and By-Laws, which was approved at this session, no amendments should be hurriedly made.

Your Reference Committee therefore recommends: (1) That the Board of Trustees be empowered to continue the activities of the Committee on Rural Medical Service on a committee basis; (2) that the Speaker of the House refer the matter of merging this committee with the Council on Medical Service and the alternative proposal of the development of a new Council on Rural Medical Care to the appropriate committee of this House for consideration and report at a subsequent meeting.

2. Proposed Amendment to By-Laws, Chapter X, Section 4 (B). Your reference committee finds that the House has already approved a report of another reference committee on this subject:

After a careful review of the points brought out by those who appeared at the hearing, it is the judgment of your committee that the action taken by the House in approving the report of the other reference committee on the subject adequately covers this matter. Your reference committee recommends disapproval of the proposed amendment.

Respectfully submitted,

Arthur J. Bedell, Chairman.
William F. Costello, Secretary.
James Q. Graves.
Howard R. Dudgeon.
Theodore H. Harwood.

Dr. Bedell moved adoption of each recommendation in the section of the report of the reference committee dealing with the merger of the Committee on Rural Medical Service with the Council on Medical Service, and the motions were duly seconded and carried.

It was moved by Dr. Bedell and seconded by several that the report of the reference committee disapproving the proposed amendment to the By-Laws, Chapter X, Section 4 (B) be adopted.

Dr. Hilton S. Read, New Jersey, moved to amend the report by the adoption of the proposed amendment as originally submitted to the reference committee. This motion was seconded by several. There was discussion by Dr. John W. Cline, California; the Speaker, Dr. Hilton S. Read, New Jersey, Dr. Lowell S. Goin, California, and Dr. Victor Johnson of the Council on Medical Education and Hospitals; the amendment to adopt the proposed amendment to the By-Laws instead of the report of the reference committee was adopted.

On motion of Dr. Bedell, seconded by Dr. Mather Pfeiffenberger, Illinois, and carried, the report of the reference committee as amended was adopted as a whole.

Dr. Bedell stated that the reference committee would now have to meet again to bring in the contemplated change in the By-Laws, and the Speaker referred the matter to the reference committee after discussion by Dr. Lowell S. Goin, California; the Speaker, Dr. E. P. Flood, New York, and Dr. Allen H. Bunce, Georgia.

Report of Reference Committee on Medical Service and Prepayment Insurance

Dr. H. B. Mulholland, Chairman, presented the following report:

1. Report of Committee to Study Conditions of General Practice: Your reference committee has considered the Report of the special committee appointed by the Board of Trustees in accordance with the action of this House to study conditions as outlined under seven headings in the address of President Shoulders at the Atlantic City Session. The proposals are most comprehensive, some of them including studies that have been in progress for some time and will require much additional effort to finish. The Committee approved the definition of "General Practitioner" as contained in the report. Studies to determine the need for more medical graduates, studies of graduate and postgraduate medical training, and studies of need of communities for additional medical services are being conducted by agencies of the American Medical Association.

Your committee approves the recommendation that qualified general practitioners have staff privileges and representation on hospital staffs and that the utilization of community hospitals for training of general practitioners be encouraged. It is in accord with the recommendation that the American Medical Association be the evaluating agency in medical education, both graduate and undergraduate, and that there should be closest possible liaison with all other agencies and organizations. It agree with the committee that general practitioners should be encouraged to participate in the scientific and organizational activities of organized medicine.

The report is comprehensive and is approved in its entirety.

2. Supplementary Report of Council on Medical Service: Your committee has considered the Supplementary Report of the Council on Medical Service which contains a reference to the activities of the American Medical Association's representatives during the recent National Health Assembly in Washington. American medicine should be justly proud of the able service rendered by these representatives.

Your committee feels that sections of this report contain ambiguous statements which should be clarified. Page 1, paragraph 2, reads:

"The principle of contributory health insurance should be the basic method of financing medical care for the large majority of the American people, in order to remove the burden of unpredictable sickness costs, abolish the economic barrier to adequate medical services and avoid the *indignities* of a 'means test.'"

It should be distinctly understood that the term "contributory health insurance" should not include government contributions in financing this type of medical care except where the need for such government contributions is definitely established. In the same paragraph it should be emphasized that the terms "avoid the indignities of a means test" does in no sense indicate favoring the abolition of this test. Your committee recommends that these clarifications be given the widest possible publicity.

3. Report of Council on Medical Service Re Meeting of Council June 19, 1948: Your reference committee met to consider the report of the Council on Medical Service on a meeting held by this Council and representatives of thirty-six state medical associations and the Territory of Hawaii on June 19, 1948.

The purpose of this meeting was to discuss the advisability of Associated Medical Care Plans and Blue Cross establishing or creating a national enrolment organization to implement the hospital and medical health insurance coverage of employees of national employer. It was agreed by those attending the meeting that there was a need for such organization. This matter was then referred to the Council on Medical Service and the Commission of Associated Medical Care Plans for further study to determine the structural organization and proper function of such a needed organization and they were asked to report their recommendations at an early date.

Your committee, after hearing the opinions expressed by the Council on Medical Service and representative commissioners of the Associated Medical Care Plans, is in accord with and approves the principles enunciated and the action taken at the meeting on June 19, 1948.

Respectfully submitted,

H. B. Mulholland, Chairman.
H. G. Hamer.
Stephen E. Gavin.
D. A. Rhinehart.
L. Howard Schriver.

Dr. Mulholland moved adoption of the section of the report of the reference committee approving the Report of the Committee to Study Conditions of General Practice, and the motion was seconded by several. Dr. James P. Kerby, Utah, requested that there be added that it is the sense of the House that medical services shall be furnished only by doctors of medicine and that no medical services shall be furnished by Blue Cross plans, and this was seconded by Dr. E. Vincent Askey, California, and was lost after discussion by Dr. Robert L. Novy, Michigan; Dr. Kerby; Dr. L. G. Christian, Michigan; Dr. Mulholland, and the Speaker.

The motion of Dr. Mulholland to adopt this section of the report of the reference committee was then adopted.

The portion of the report of the reference committee referring to the Supplementary Report of the Council on Medical Service was adopted on motion of Dr. Mulholland, seconded by several and carried.

Dr. Mulholland moved that the report of the reference committee dealing with the Report of the Council on Medical Service Re Meeting June 19, 1948, be adopted, and the motion was seconded by Dr. H. P. Ramsey, District of Columbia, and carried.

On motion of Dr. Mulholland, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, the report of the reference committee was adopted as a whole.

Report of Reference Committee on Amendments to Constitution and By-Laws

Dr. Arthur J. Bedell, Chairman, presented the following report:

Proposed Amendment to By-Laws, Chapter X, Section 4 (B): Your reference committee at the request of the House recommends adoption of a change in Chapter X, Section 4 (B) so as to read:

"The Council on Medical Education and Hospitals shall consist of seven Member or Service Fellows, at least one of whom shall be a private practitioner of medicine not a faculty member of a medical school and not a member of a staff of a hospital associated with a medical school or university, elected by the House of Delegates on nomination by the Board of Trustees for terms of seven years so arranged that at each annual session the term of one member expires."

The By-Laws were amended to read as indicated by the reference committee on motion of Dr. Bedell, seconded by Dr. H. B. Everett, Tennessee, and carried by more than a two-thirds vote of the House.

Report of Committee on Hospitals and the Practice of Medicine

Dr. E. L. Henderson, Chairman, Board of Trustees, requested Dr. Elmer Hess, Chairman, Committee on Hospitals and the Practice of Medicine, to present the report of that committee, which follows:

This Committee was asked to study the practice of medicine by hospitals with due consideration to the many resolutions pertaining to this subject that have been acted on by the House of Delegates in the past ten or fifteen years, to correlate these and to determine if any further action is necessary to enforce them.

These resolutions for the most part have been presented by the radiologists, pathologists and anesthesiologists. They have received serious consideration by various reference committees and many hearings have been held. In 1942 the Trustees were asked to hold a conference with the American College of Surgeons and hospital associations and representatives of various special interested groups. This was done and a comprehensive report was presented to the House of Delegates by the trustees, and thereafter printed in full in The Journal. Since that time several other resolutions of similar nature have been acted on. A study of this mass of material suggests to your Committee that certain policies have been agreed on: (1) that some positive action against those institutions be taken by the American Medical Association where investigation has proved that these institutions were not operating under the broad general principles of ethics expounded by the American Medical Association; and (2) that physicians as individuals could be disciplined for unethical conduct only according to the machinery set up for the control of such conduct already established at the county society level.

Your Committee has had four meetings during this session of the House, and many men representing various groups have been fully heard. It *recognizes the seriousness of the entire situation* and realizes that something *must* be done about it. The more we study the situation, the wider and wider are the ramifications of the problem, many of which are contradictory and simply impossible of solution at the present time. At this particular moment the Committee does not believe that it has had sufficient time to study all of these tremendous problems and arrive at satisfactory conclusions which will be acceptable to the Board of Trustees and to this House of Delegates. This problem is likewise of grave importance to the Commission of the Blue Cross and Blue Shield, which are cooperating in an endeavor to furnish medical service under physicician-sponsored programs, and we have the following assurances from the committee appointed by the Commission to study this problem: "(1) No definite action be attempted by this Committee or the Blue Shield Commission until such time as the relationships inherent in the solution of the problem have been agreed on by the official bodies of the specialty groups involved and the American Medical Association, and (2) Because its membership is composed of persons intimately familiar with the administration of Blue Shield plans, its services should and will be made available on a consultative and cooperative basis to the specialty groups concerned and to the American Medical Association whenever and wherever desired by those organizations." Your committee therefore has two recommendations to make:

1. Because of the difference in the laws of the various states, your Committee recommends that the Bureau of Legal Medicine and Legislation of the American Medical Association be instructed immediately to make a study of the various state laws defining the legal status of corporations attempting to practice medicine in the various states, defining in each instance the differences in the various state laws concerned with this problem, and that, if necessary, legislation be prepared by the Bureau of Legal Medicine and Legislation which will define all of these matters so that uniform legislation to simplify legal interpretations may be prepared and supported by the American Medical Association to insure the legality of the actions taken.

2. That the House of Delegates request the Board of Trustees to send within the next six weeks an official communication to medical schools and hospitals informing them of the principles and policies of the House of Delegates concerning the practice of medicine by institutions and stating that the American Medical Association will be glad to cooperate in every way with such institutions and appealing to them for immediate cooperation in the general over-all plan and for assistance in the preservation of the private practice of medicine.

Respectfully submitted,

Elmer Hess, Chairman.
Walter G. Phippen.
Walter E. Vest.
John W. Cline.
Edwin S. Hamilton.

The suggestions of the committee, on consent of Dr. Hess, were amended by including the American Hospital Association and other national hospital organizations, and the suggestions as amended were then adopted.

(To be continued)

Washington Letter

(From Our Regular Correspondent)

July 8, 1948.

Three-Point National Health Assembly Plan Proposed

At its first meeting (June 28) since the National Health Assembly was held May 1-4, the Assembly's executive committee advanced three proposals. As made public by the Federal Security Agency, under whose auspices the May conference was held, the suggestions were: (1) that the executive committee maintain its existence and continue to function as an advisory and coordinating group; (2) that the Federal Security Administrator name a small subcommittee to draft plans for public health education and on organization and financing; (3) that each state be urged to hold a health assembly of its own at regular intervals, with equal representation to professional and "consumer" groups in order to stimulate the widest possible cooperation among all concerned in health. Local health assemblies also were advocated.

Tasks which Oscar R. Ewing, as Federal Security Administrator and chaiman of the National Health Assembly, will ask the subcommittee to consider include: publication of final recommendations of the fourteen sections which comprised the Assembly; implementation of these recommendations, and development of plans for guidance of the proposed state and local health conferences.

Plans for $40,000,000 Research Center

Full cooperation will be maintained with voluntary organizations and private teaching institutions, as well as government agencies, in the operation of the new five hundred bed clinical research center to be erected at nearby Bethesda, Md., according to Oscar R. Ewing. The Federal Security Administrator, at a special press conference, disclosed that bids for the initial stages of construction will be opened in July. It is hoped to have the $40,000,000 project, a unit of the National Institutes of Health, completed and in use before the end of 1951. Cancer and cardiovascular, mental, tropical and certain infectious diseases will receive major emphasis in the research center's laboratories and wards. Dr. Leonard A. Scheele, Surgeon General of the U. S. Public Health Service, who participated in the conference, said: "There will be a rigid adherence to the principle that no treatment shall be applied to a patient until its safety has been thoroughly proved. We will do our best to cure patients suffering from diseases which now afflict a vast number of persons and for which only limited treatment has as yet been discovered."

Admission of patients will be through reference by physicians, hospitals and staffs of other health agencies throughout the country, Dr. Scheele asserted. Medical reports will form the basis for selection and, on discharge from the hospital, patients will be referred back to their private physicians. Entirely air conditioned, the structure—thirteen stories in height—will be of such size that its five hundred beds will occupy less than one third of the space. The north side of the main building and six wings will be devoted to laboratories. Dr. Jack Masur is administrative officer for the undertaking.

Medical Committee on Civil Defense Planning Meets

July's first press announcement by the Office of the Secretary of Defense was that the special advisory committee to the Office of Civil Defense Planning would meet on July 6. It was scheduled to present recommendations to Russell J. Hopley, director of the Office of Civil Defense Planning, for a peacetime organization of medical resources that could be quickly enlarged in event of war. Dr. Perrin H. Long heads the committee, whose other members are Drs. E. H. Cushing, N. C. Kiefer, E. F. Daily, R. B. Snaveley, Robin Buerki, James A. Crabtree, C. E. Albricht, P. S. Owens, F. Wilson, R. L. Sensenich, R. P. Fischelis, W. R. Krill and C. Willard Camalier, the Rev. D. A. MacGowan, Miss Margaret Arnstein, Lieut. Col. K. E. Baltz, Capt. C. C. Myers, Col. E. S. Standlee and Brig. Gen. J. M. Hargreaves.

Dr. Louis G. Welt Leaves Veterans Administration for Yale

The Veterans Administration has announced the resignation of Dr. Louis G. Welt as head of the section on general medical research. His replacement, scheduled to report in August, is Dr. Alfred Lawton, dean of the University of North Dakota School of Medicine. Dr. Welt, who joined the Veterans Administration last year after Army service, has accepted a post on the Yale medical faculty and will devote a large portion of his time to research in the university hospital.

Millions Approved for Hospital Expansion Planning

A cumulative report, up to June 25, by U. S. Public Health Service (Division of Hospital Facilities) shows that approval has been given forty-eight state plans for expansion of their hospital and health center facilities under the Hill-Burton Hospital Survey and Construction Act. Allotments for the execution of these plans aggregate $74,438,700. Alaska, the District of Columbia, Hawaii and Puerto Rico are included among the forty-eight approvals.

Rehabilitation Record

On the occasion of the fifth anniversary (July 6) of legislation expanding the federal-state program of vocational rehabilitation for the physically handicapped, Director Michael J. Shortley of the Office of Vocational Rehabilitation reported that more than 50,000 cases were handled successfully during the fiscal year ended June 30. "Outstanding allies" in the program's success, said Shortley, include the American Medical Association, the National Society for Crippled Children and Adults, the National Tuberculosis Association, the American Hearing Society, National Industries for the Blind, the National Association to Control Epilepsy, the National Association of the Deaf, Goodwill Industries, the National Fraternal Society of the Deaf, American Instructors of the Deaf and the National Society for Prevention of Blindness.

NAVY

FIFTIETH ANNIVERSARY OF HOSPITAL CORPS

When the Navy Hospital Corps was established by act of Congress in 1898, fewer than two hundred hospital corpsmen were in the Navy; the hospital corps during World War II reached an all time high of 137,000. Of the 14,748 corpsmen on active duty today, about 10 per cent are constantly under formal instruction in subjects allied to the medical profession and peculiar to the needs of the armed forces. To supply trained enlisted personnel for the Medical Department, formal advanced courses of instruction are carried on in addition to basic training. Specialty courses available to enlisted personnel in the Medical Department include clinical laboratory, pharmacy, physical medicine, x-ray, neuropsychiatry and aviation medicine; those demonstrating special aptitude are instructed in and may become certified technicians in medical photography, medical supply, orthopedic appliances mechanics, equipment repair, hospital commissary, administrative procedures and submarine and diving duty. The Navy trains hospital corpsmen also as medical research assistants and in the new science of atomic medicine. Until last year the enlisted hospital corpsmen desiring to make the Navy a career could be promoted only to the rank of chief warrant officer; then Congress established the Medical Service Corps as a commissioned officer promotion outlet with ranks up to and including that of captain.

MEETING OF RESERVE VOLUNTEER DIVISION

The U. S. Naval Reserve Volunteer Medical Division 4-9 held its first meeting May 25 at the Naval Base, Philadelphia, where the principal speaker was Dr. Lowell Aston Erf, professor of hematology, Jefferson Medical College, Philadelphia, a captain in the Army Medical Corps Reserve. His subject was "Atomic Energy and Its Relation to Medicine." Capt. J. R. Thomas, Fourth Naval District Medical Officer, announced at the meeting that the activation of the twenty-two divisions assigned to the Fourth Naval District would be completed in a short time.

NEW REGULAR OFFICERS

Dr. John Robert Lee Jr., Brooklyn graduate of Cornell University School of Medicine, has accepted an appointment as Lieutenant (jg) in the regular corps of the Navy.

The following recent graduates of medical schools have accepted appointment as lieutenants (jg) in the Medical Corps of the Regular Navy: John J. Downey of Port Jefferson, N. Y.; Anthony R. Gennaro of Passaic, N. J.; Paul Hart of Arlington, Mass.; James L. Pollock Jr., of Denver, Colo.; Richard E. Sullivan of Binghamton, N. Y., and Joseph C. Whatley of Marshall, Va.

NEW NAVY INTERNS

The following young doctors have accepted appointments as Lieutenant (jg) in the Medical Corps Reserve of the U. S. Naval Reserve, and have been assigned duty as interns as indicated:

Marvin S. Allen of Atlanta, Ga.; Ernest L. Bauer of Benton, Ill.; Ernest Alfred Blakey of Pawtucket, R. I.; Wallace F. Buttrick of Burlington, Vt.; Robert J. Clohecy of Smithfield, Pa.; Thomas S. Ely of Bethesda, Md.; Rodney H. Foss of Portland, Me.; Clifford W. Gates of Abington, Mass.; Charles M. Hendricks Jr., of Greenville, S. C.; Forster G. Huhl of Northfield, Mass.; Clifford A. Johnson Jr. of Omaha, Neb.; Robert R. Klamt of Ashton, Idaho; Chester L. Klein of Redlands, Calif.; Francis J. Linehan Jr. of Stamford, Conn.; Lindsey F. Lovett of Atlanta, Ga.; Vernon J. Merkle of Omaha, Neb.; George D. Mogil of Cleveland; Joseph T. Morreale of Los Angeles; David Walker Mullins of Logan, W. Va.; Joseph W. Peabody Jr. of Chevy Chase, Md.; Jarvis H. Post of Greensburg, Pa.; Lew W. Purinton of Pleasanton, Kan.; Harvey O. Randell of Camp Hill, Pa.; William C. Rountree of New Orleans; Robert J. Schramel of Overland, Mo.; John R. Shanahan of Washington, D. C.; Thomas W. D. Smith of Murray, Utah; Frank J. Strick of Kansas City, Kan.; James D. Thornton of Baltimore; Charles W. Werner of Los Angeles, and George M. Wilson Jr. of Washington, D. C.

VETERANS ADMINISTRATION

HOMES FOR VETERANS IN WHEEL CHAIRS

The President has signed into law a bill which provides certain paralyzed veterans with federal grants up to $10,000 to be used to purchase or remodel homes especially designed for wheel chair living. Those eligible under the law are veterans who served in the armed forces in war or peace since April 21, 1898, who have a permanent total service-connected disability resulting in paralysis of the legs and lower part of the body. In determining the eligibility of applicants the Veterans Administration must ascertain that it is medically feasible for the veteran to live in the house, that the cost of the house bears a proper relation to his income and that it is suitable to his particular requirements. Veterans Administration is authorized also to supply eligible veterans, free of charge, with plans and specifications of suitable housing units. The special features which may be incorporated in such homes include ramps instead of stairs, special bathroom arrangements and fixtures, extra wide halls and doorways, larger rooms, and in some cases facilities for exercise. A veteran who qualifies is entitled to a federal grant not to exceed 50 per cent of the total cost of the home including the lot or a maximum of $10,000.

NON-SERVICE-CONNECTED DISABILITIES

On May 31 the total number of veterans in hospitals was 106,089, of whom 12,775 were in nonveteran hospitals. Of the total number of hospital patients 68,900 (about 65 per cent) were veterans with non-service-connected disabilities.

DR. THORNDIKE TO DIRECT PROSTHETIC SERVICE

The medical director of the Veterans Administration, Dr. Paul B. Magnuson, announces the appointment of Dr. Augusta Thorndike of Boston as director of the Prosthetic and Sensory Aids Service, which is in charge of providing artificial limbs, eyes, hearing aids, orthopedic shoes and similar devices for disabled veterans and conducts research endeavoring to improve such appliances. The service operates fifteen plastic artificial eye laboratories and supervises twenty-nine brace shops for the making and repair of braces and artificial limbs. Dr. Thorndike, an associate in surgery at Harvard Medical School and consultant in traumatic conditions at Massachusetts General Hospital, served overseas in the Pacific during the recent war and later was director of the Army's reconditioning program in the Surgeon General's Office. He is a member of the American Surgical Association, Boston Surgical Society, and is a specialist certified by the American Board of Surgery.

CONTRACT FOR HOSPITAL

A contract for $4,779,200 has been awarded for the construction of a 250 bed addition to the veterans' hospital at Alexandria, La. The addition will be used for the treatment of veterans suffering from tuberculosis and will bring the total capacity of the hospital to 912 beds, of which 662 are for general medical and surgical patients.

INFLUENCE OF RADIOACTIVE MATERIALS ON CROPS

The Atomic Energy Commission and the Department of Agriculture announce a study of the influence of radioactive materials on growth of crop plants. The new project will aim to determine the effects of radioactive materials used in fertilizer applications, not as tracers measuring the effects of standard fertilizer materials but as a direct influence on the fertilized crops. The investigation is designed to answer a number of questions on the relation between plant growth and radioactivity. It has long been known that all soils are radioactive to some degree. Will applications of radioactive materials improve plant growth? What degree of radioactivity will the crop have as a result of the application?

While many experiments have been conducted in Europe and America to study the influence of radioactivity on plant growth, the results have been conflicting and inconclusive. Investigations by qualified American and Japanese scientists failed to reveal any basis for the claim that radiation from the atomic bomb benefited crops at Nagasaki. Except for experimental purposes, the use of radioactive material by farmers cannot be recommended on the basis of present knowledge. Many important questions must be answered before the influence of radioactive materials on plant growth is known.

AWARDS AND COMMENDATIONS

Edward F. Knipling

The Department of National Defense on May 20, 1948 awarded the Medal of Merit to Edward F. Knipling, director of the Orlando Station of the Bureau of Entomology and Plant Quarantine, U. S. Department of Agriculture, during the war period. The citation, which was signed by the President of the United States, read as follows: "He planned and directed investigations for the development of insecticides and repellents for the prevention of insect-borne diseases in the United States Army. As a result of these studies the Armed Forces adopted the use of DDT for the control of insect-borne diseases and new uses and equipment were developed for the dispersing of insecticides by new methods, including the airplane spraying of infested areas. All these research contributions were of inestimable value to the health and morale of United States troops, as well as to the Nation as a whole."

Dr. G. Canby Robinson

The Medal for Merit has been awarded to Dr. G. Canby Robinson of Baltimore for exceptionally meritorious conduct in performance of outstanding services to the United States from July 1941 to December 1945. The citation, signed by the President of the United States, read in part as follows: Dr. Robinson, as Director of the National Blood Donor Service of the American National Red Cross, labored unceasingly in the operation and rapid expansion of this vast activity which never failed to meet the constantly increasing needs for more and more blood plasma, serum albumin or whole blood for transfusion into the veins of wounded men in theaters of operation. He personally directed the machinery in arousing and sustaining the interest of his fellow countrymen in giving voluntarily of their blood, in recruiting and screening hundreds of thousands of potential donors throughout the United States and in arranging for the proper handling and transportation of the drawn blood to processing laboratories or to centers from which it was flown as whole blood to European or Pacific theaters of operation. These efforts, involving over thirteen millions of bleedings of individuals, required constant maintenance of high professional medical standards, in addition to an unusual degree of skill and efficiency in operation, all the while working not with formal and regulated groups recognizing one central authority, but with the unregimented general public throughout the Nation. The phenonemal success attained and which resulted in the wholesale saving of life through supplying the armed forces with the blood needed for transfusion purposes reflects great credit on him. Dr. Robinson's efforts were characterized by unfailing energy, sound judgment, foresight, tact, capacity to cooperate with others, ability to obtain results and a marked devotion to duty. Dr. Robinson graduated from Johns Hopkins University School of Medicine in 1903.

STUDY OF OPERATING ROOM EXPLOSIONS

The Federal Government has established a committee to make a scientific investigation into the causes of explosions in hospital operating rooms. The nine man committee was created by the Commissioner of the Public Buildings Administration of the Federal Works Agency, whose architects and engineers have been building hospitals for almost a century and who are now preparing plans for the five hundred bed research laboratory at Bethesda, Md., for the National Institute of Health. Other major projects they are working on are the 1,250 bed District of Columbia Hospital Center and a 635 bed Marine hospital in San Francisco. The committee's recommendations will be incorporated in the design of the operating rooms of these projects. This is the first time that the Federal Government has started a thorough scientific inquiry into the reasons for these explosions. A subcommittee will prepare tentative specifications for operating room floors which will include the floor extending 15 feet (4.6 meters) outside of the operating room doors. Moreover, the specifications will embrace a testing device which shall be installed to check the resistance of the shoes worn by the occupants before they enter the room. The report of the full committee not only will include the architectural and engineering features of an operating room but will also present definite recommendations for those in charge of hospitals to guide them in the control of the personnel and movable equipment.

PERSONALS

John J. Swearingen has been appointed chief of Aeromedical Design and Material Division of the Medical Facility laboratories of the Aeronautical Center, Civil Aeronautics Administration, at Oklahoma City. Lieut. Swearingen was recently on active duty in the Naval Reserve serving as head of the school of physical therapy at the Naval Medical Center, Bethesda, Md.

J. J. Donnell has been appointed chief of the Roentgenologic and Diagnostic Research Laboratory of the Aviation Facility, Aeronautical Center, Civil Aeronautics Administration, at Oklahoma City. Dr. Donnell formerly was a member of the staff of the Jersey City Hospital.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ARKANSAS

State Society Appoints Executive Secretary.—The Arkansas Medical Society has appointed Mr. Sid Wrightsman Jr. as executive secretary. He will maintain a business office at 310 Professional Building, Fort Smith.

Narcotic Violation.—Dr. Albert G. McGill, Little Rock, entered a plea of nolo contendere to section 2554 of the internal revenue code in the United States District Court at Little Rock. On March 17 a sentence of two years was suspended and he was placed on probation.

CALIFORNIA

California Society of Internal Medicine.—Dr. Harold M. F. Behneman, president of the California Society of Internal Medicine, is chief of staff of The Desert Clinic, Palm Springs, Calif., and not a resident of San Francisco as stated in THE JOURNAL, May 29, 1948, page 476.

University Appointment.—Dr. Mervin C. Myerson, Beverly Hills, was recently appointed associate professor of otolaryngology at the College of Medical Evangelists, Loma Linda-Los Angeles, and director of the college's division of otolaryngology at the Los Angeles General Hospital.

ILLINOIS

Increase in Undulant Fever in Illinois.—Morbidity statistics released by the state department of health, June 30, show a steady rise in the reported prevalence of undulant fever in Illinois. Only 5 cases were reported in Illinois in 1927; by 1935 the number had risen to 144; in 1938 to 216; in 1943 to over 300, and in 1947 553 cases were reported. During the first twenty-four weeks of this year 232 cases had been reported to the state department of public health, as compared to 223 cases in the same period in 1947. Only 8 of the 232 cases reported this year occurred in Chicago.

Chicago

Dr. Cori to Receive Garvan Medal.—Dr. Gerty T. Cori, Washington University School of Medicine, St. Louis, has been named the recipient of the American Chemical Society's Francis P. Garvan Medal, which will be bestowed at the fall meeting. Dr. Cori shared the 1947 Nobel Prize in medicine with her husband, Dr. Carl F. Cori, Washington University, and Dr. Bernardo A. Houssay, Buenos Aires.

Betatron for Research at Illinois.—Delivery of a 20,000,000 volt betatron for cancer treatment and research is expected to be made in five months to the University of Illinois College of Medicine. Dr. Roger A. Harvey, head of the department of radiology, will be in charge. The betatron will be housed in a small building, mostly underground, erected south of the university's research and educational hospitals. Ground-breaking exercises were conducted June 18.

Orientation Course in Allergy.—Northwestern University Medical School will offer a five day orientation course in allergy under the sponsorship of the American Academy of Allergy, October 25-29. The course will comprise a practical coverage of the subject and will utilize teachers not only from Northwestern University, but also from other local and out-of-town medical schools. For particulars, direct communications to Department of Allergy, Northwestern University Medical School, Chicago.

Appoint Curator of Pollen Collection.—The American Academy of Allergy has named Ralph F. Voigt, Ph.D., assistant professor of pharmacognosy and pharmacology, as curator of its collection of allergenic pollen and specimens of all plants producing hay fever throughout the United States. The samples of pollen and their respective herbarium specimens will be kept by the University of Illinois College of Pharmacy at its proposed Drug Plant Experimentation Station at Lisle, of which Dr. Voigt is assistant to the director. Physicians and research workers will be able to obtain authentic slides of the various pollens that are common to their particular geographic area as they are made available.

KANSAS

State Disaster Meeting.—A meeting of public officials and American Red Cross disaster officials was held in Topeka May 18 to review governmental and Red Cross functions during disaster situations and to interpret and explain the responsibilities of state, county and municipal governmental agencies. Kansas is said to be the third state to organize a disaster meeting as planned at the national convention last year.

MASSACHUSETTS

Purchase Building for District Society.—The Worcester Medical Library, Inc., has purchased and repaired a building to be used as headquarters for the Worcester District Medical Society. Open house was held April 21. Preservation of pictures and of medical and surgical instruments of historical value is a possibility for the future. There are rooms for committee meetings and for development of a program for health education. A strabismus clinic has already been established in one of the rooms.

MISSOURI

Movies for Patients.—The Volunteer Film Association of St. Louis last year conducted 1,670 showings of motion picture films for persons confined to their homes by illness. This organization, started in 1939 with 59 members, two films and one projector, has grown to a membership of 627, a large film library and ten projectors. More than 200 members serve as exhibitors in teams of two, going into homes and hospitals. Films are first reviewed by a committee and are selected for suitability to the patient's physical condition. For example, silent motion pictures are selected for cardiac children; as the physical condition improves, more stimulating films can be shown, sound can be introduced and teaching films coordinated with the home teaching programs are added. A referral committee works with the physicians, social workers, hospital and social agencies to find shut-ins who will benefit from the service. In response to requests from other cities the association is preparing an outline of its experiences as a guide for other organizations. The association is largely the work of Miss Marjorie Land, a former medical student and invalid for many years, and Miss Sue Barnes, an occupational therapist.

NEW YORK

State Takes Over Tuberculosis Sanatorium.—The official transfer of Oneida County Tuberculosis Sanatorium, Utica, from the county to the state was completed June 1. The services of the sanatorium will be expanded, particularly in the field of clinical services in the county. The sanatorium has one hundred and eighty-two beds and a staff of one hundred. Dr. William C. Jensen is expected to continue as superintendent.

Postgraduate Lectures.—The Medical Society of the State of New York and the New York State Department of Health have arranged postgraduate instruction for the Suffolk County Medical Society at Mather Memorial Hospital, Port Jefferson, Long Island, August 26, at 11:30 a. m. Dr. Claude E. Heaton, New York, will speak on "The Management of Difficult Labor," and Dr. John S. Labate, New York, on "The Recognition and Prevention of Injuries and Diseases of the Fetus." The Cayuga County Medical Society, meeting September 16 at the Osborne Hotel, Auburn, will hear Dr. Richard H. Lyons, Syracuse, speak on "The Management of Peripheral Vascular Disease States."

New York City

Appointed to Institute of Rehabilitation.—Dr. Hans Kraus has been appointed assistant professor of clinical rehabilitation at New York University College of Medicine's department of rehabilitation and physical medicine. Dr. Kraus will be associated with the rehabilitation and physical medicine service in Bellevue Hospital.

Construction of Medical Center to Start This Year.—Construction of some buildings of the New York City University-Bellevue Medical Center will begin by early fall, according to Center officials. The first buildings will be the new clinical laboratories and class rooms, the Hall of Residence, and the Alumni Hall. For medical students whose service at Bellevue Hospital requires them to be on call at night, the Hall of Residence will provide about three hundred dormatory rooms. The Alumni Hall will accommodate about five hundred persons. Eleven acres of land are included in the Center's property, which lies between First Avenue and East River Drive. The streets in the area will be closed off. In exchange for this privilege, the university is making available to the city 17,500 square feet of land as a site for the Institute of Forensic Medicine, which will become the headquarters of the chief examiner's office, the city morgue and other facilities and will be jointly operated by the city and the university.

NORTH CAROLINA

Cytologic Laboratory and Tropical Institute.—The Bowman Gray School of Medicine, Winston-Salem, established a cytologic laboratory for the early diagnosis of cancer in the department of pathology on July 1 with Dr. Coy C. Carpenter, dean, who has also served as professor of pathology since 1926, in direct charge. The laboratory will employ the Papanicolaou method of diagnosing cancer by studying abnormal cells. Dr. Carpenter worked in the laboratory of Dr. George N. Papanicolaou for two weeks in May. Services of the laboratory will be offered to practically all women coming to the hospital and to other hospitals and doctors throughout North Carolina. Mass surveys of all women in a given area, such as that being conducted by the state of Delaware, is one of the ultimate objects of the laboratory.

The first step in the establishment of the Institute of Tropical Medicine of the Bowman Gray School of Medicine was made recently with the announcement of a gift of $33,000 from a New York patron for building and equipping an additional floor in the medical school building. The institute will be used by the Veterans Administration as a research and teaching center. The new laboratory will also provide supervisory medical and sanitary service for a sugar company in the Dominican Republic which is building a field laboratory. Each quarter one or two medical students will assist in field survey work there, where surveys of malaria and intestinal infections among the labor population of the plantation will be conducted. A limited number of Dominican doctors will study at the institute.

OHIO

Health Department Adds Two Services.—In the reorganization of the Ohio Department of Health two officers have been added. Dr. Paul Q. Peterson, Columbus, is chief of the new Bureau of Direct Services, which includes the sanitary engineering division, laboratories division, vital statistics division, industrial hygiene division and hospital facilities. Besides coordinating the functions of these direct service divisions, Dr. Peterson will be responsible for the public health training program. A cancer division in the Bureau of Local Services has been created with Dr. Walter B. Lacock, Columbus, as director.

PENNSYLVANIA

Course in Allergy.—Physicians in the vicinity of Pittsburg are invited to enroll in the University of Pittsburgh School of Medicine's orientation course in allergy to be given on ten Thursday afternoons beginning September 2. The course will include didactic, laboratory and clinical presentations in allergy and all the related specialities. Address all inquires to Samuel P. Barbison, M. D., Chairman, Committee on Postgraduate Education, Dean's Office, University School of Medicine, O'Hara Street, Pittsburgh 13. Pa.

Philadelphia

Personal.—Detlev W. Bronk, Ph. D. director of the Johnson Research Foundation of the University of Pennsylvania, has been elected a foreign member of the Royal Society of London. Dr. Bronk returned recently from the dedication of the Nobel Institute in Neurophysiology in Stockholm, Sweden.

University Appointments.—The Woman's Medical College of Pennsylvania has announced the appointment of three of its alumnae to the faculty: Dorothy Macy Jr., who after three years in internal medicine at the Mayo Clinic is returning as an associate in physiology; Annella Brown, after a residency at the Crile Clinic, Cleveland, will return as a fellow in surgery; Isabella H. Perry, San Francisco, will be director of the new cancer teaching program.

VIRGINIA

Horsley Memorial Prize.—The tenth biennial award of the John Horsley Memorial Prize in Medicine was made on April 28, in connection with the Sigma Xi annual initiation of new members. The award, a certificate and a prize of $600, was founded in 1927 by Dr. J. Shelton Horsley, Richmond, in memory of his father. The winner of this year's award was Dr. James W. Culbertson, Boston, graduate of University of Virginia Department of Medicine, Charlottesville, 1940, for his research on the "Effect of Various Types of Sympathectomy Upon Vasopressor Responses in Hypertensive Patients."

WEST VIRGINIA

Society News.—Dr. Chauncy B. Wright, Huntington, has been reelected chairman of the board of directors of the West Virginia Cancer Society; Charles Lively, executive secretary of the state medical association, was reelected secretary.

Appointed to Child Health Committee.—Dr. Newman H. Dyer, state health commissioner, and Robert Roth, director, department of public assistance, will serve as ex officio members of the West Virginia Committee for Community Planning for Children and Youth, organized to arrange the state's participation in the 1950 White House Conference, which will be the first held since 1941.

GENERAL

Society Elections.—At the annual meeting of the American Gastroscopic Society in Atlantic City, N. J., May 2, Dr. James L. Borland, Jacksonville, Fla. was elected president and Dr. J. Edward Berk, Philadelphia, secretary-treasurer.—At the recent meeting of the American Association of Industrial Physicians and Surgeons in Boston, Dr. Harold A. Vonachen, Peoria, Ill., was elected president; Dr. Frederick W. Slobe, Chicago, secretary, and Dr. Edward C. Holmbald, Chicago, treasurer.

International Congress on Mental Deficiency.—At the annual meeting of the American Association on Mental Deficiency in Boston, May 18-22, an International Congress on Mental Deficiency was formed with Dr. Edward J. Humphreys, Columbus, Ohio, president, and Lloyd N. Yepsen, Ph.D., Trenton, N. J., secretary. This session was the first international congress, and the second will be held in New York in May 1951. The first Pan-American Congress on Mental Deficiency is to be held in New Orleans in 1949. Elected officers of the American Association on Mental Deficiency are: Dr. Humphreys, president; Miss Mildred Tompson, St. Paul, Minn., president-elect; and Dr. Neil A. Dayton, Mansfield Depot, Conn., secretary-treasurer. Mr. Richard H. Hungerford, New York, Board of Education, was chosen editor of the *American Journal of Mental Deficiency*.

Aid for Foreign Devestated Areas.—The Medical and Surgical Relief Committee, Inc., 420 Lexington Avenue, New York 17, which in the last seven years has provided more than $1,000,000 dollars' worth of desperately needed medical supplies and publications to stricken overseas areas, continues to carry on and appeals to the public for aid in this work. On the Medical Advisory Council to this committee are many physicians with Dr. Allen O. Whipple as chairman. The Medical and Surgical Relief Committee receives, sorts, re-conditions and ships material that ranges from physicians samples to used instruments in response to authenticated appeals from overseas. The most pressing need is for recent medical, surgical and dental textbooks and journals. Other items urgently needed are adhesive tape; anesthetics, local and general; antiseptics; autoclaves; hot water bottles; syringes; hypodermic needles; microscopes; penicillin; cod liver oil; rubber sheeting and tubing; surgeons gloves and instruments; and thermometers.

Report of Memorial Fund.-- From Nov. 21, 1947 to Feb. 21, 1948 the Jane Coffin Childs Memorial Fund for Medical Research, New Haven, Conn., has authorized grants to institutions totaling $114,000 and six fellowship appointments. Among the grants are the following: Memorial Hospital for Cancer and Allied Diseases, N. Y., $30,000 for studies of cancer with special reference to steroids; Yale University School of Medicine, New Haven, Conn., $36,000 for a three year research on biologic behavior of tumor in natural and alien hosts; Cornell University Medical College, New York, $12,000 for a three year research program on the development, training activities and investigations of the Tumor Clinic; Yale University, $9,000 for a three year study of testicular tumors in animals; Long Island Biological Association, Cold Spring Harbor, Long Island, N. Y., $8,000 for a survey of mutagenic potencies of carcinogens and related chemicals as determined with bacteria; the Donner Foundation, $5,500 for support of the journal, Cancer Research, and Chester Beatty Research Institute of the Royal Cancer Hospital, London, England, $5,000 for research on cancer with special reference to the chemistry of carcinogenesis, viruses and chemotherapy of cancer. Six fellowships ranging from $1,400 to $7,125 were awarded to students in American institutions.

Tuberculosis Society Reorganization.—Reorganization of the National Tuberculosis Association's Medical Section, the American Trudeau Society, has been completed, according to Dr. Howard W. Bosworth Los Angeles, president of the society. The reorganization plan, which was approved by the National Tuberculosis Association Executive Committee, is based on the principle that strictly medical matters should fall within the jurisdiction of the medical section while sociologic and public health objectives should be determined by joint planning between physicians and laymen. The four main divisions established under the medical section are (1) administrative, (2) professional education, (3) medical research and therapy and (4) exchange of scientific information with foreign countries. Both the council and the executive committee recently have stressed the importance of having state Trudeau societies organized as medical sections of the tuberculosis associations, carrying out the organization relationship existing between the National Tuberculosis Association and its medical section.

Biannual Meeting of Hematology Society.—The International Society of Hematology will hold its biannual meeting at the Hotel Statler, Buffalo, August 23-26. There will be symposiums on radioactive and stable isotopes in hematology, diseases related to the red blood cells, diseases related to white blood cells, immunohematology, Rh-Hr (CDE-cde) antigen and antibodies and hemolytic anemias, coagulation problems and hemorrhagic diseases. Applications for the presentation of scientific exhibits are being received by Oliver P. Jones, Ph.D., Department of Anatomy, University of Buffalo, Buffalo. Chairman of the program committee is Dr. Ernest Witebsky, Buffalo General Hospital, Buffalo. Dr. Eduardo Uribe Guerola, Leibnitz 212, Nueva Colonia Anzurez, México, D.F., is in charge of the program from South and Central America, and Sir Lionel Whitby, Cambridge, England, in charge of arrangements for the program from Europe. Communications concerning applications for the program will be received by these committeemen. Communications and applications concerning membership will be received by Dr. William Dameshek, Chairman, 25 Bennett Street, Boston, for the United States. Those who are interested in attending may communicate with Sol Haberman, Ph.D., Secretary, William Buchannan Blood Center, Baylor Hospital, Dallas, Texas.

CORRECTION

The Nauheim Bath Not Indicated.—In the Panel Discussion on Physical Medicine in General Practice in The Journal, May 8, 1948, page 140, second column, the sentence beginning in the fifth line of Dr. McClellan's answer should read as follows: The Nauheim bath is not indicated for the patient with severe hypertension who has disability and is perhaps confined to bed because of it. In Dr. McClellan's paper in the same issue of The Journal, page 132, column 1, in the sixth line under the head "Rheumatic Conditions" the third word should be "than" instead of "that."

Marriages

THOMAS LEWIS HARRIS, Parkersburg, W. Va., to Mrs. Elizabeth Williams Moran of New York, April 17.

WILLIAM JAMES MOORE, Trenton, N.J., to Miss Marjorie Joan Van Sciver at Beverly, May 22.

EDWARD DOUGLAS HORNING, Detroit, to Miss Mary Frances Dickinson of Annapolis, Md., April 10.

FREDERICK ROBERT BROWN, Floral Park, N.Y., to Miss Cynthia Barnett of Brooklyn, March 14.

Deaths

Theodore Gaillard Croft, Jacksonville, Fla.; born in Aiken, S.C., Aug. 26, 1887; Medical College of the State of South Carolina, Charleston, 1912; member of the American Medical Association and of the Association of Seaboard Air Line Railroad Surgeons; past president of the Duval County Medical Society; served in France during World War I; lieutenant colonel in the medical reserve corps not on active duty; during World War II medical director of St. Johns River Shipbuilding Company and the Merrill-Stevens Drydock Company and served on the procurement and assignment committee; associated with the Duval County, St. Luke's and St. Vincent's hospitals; died in the Presbyterian Hospital, New York, March 17, aged 60, as the result of an operation on the chest.

George B. Weiser ⊕ New Ulm, Minn.; born in Dalmatia, Pa., in 1857; Jefferson Medical College of Philadelphia, 1879; for many years member and twice president of the state board of medical examiners; for many years member and president of the school board; past president of the Redwood-Brown Counties Medical Society; chief examiner for draft boards during World War I; formerly member of the State Tuberculosis Sanatorium Commission; served as president of the Union Hospital staff; formerly associate editor of *Minnesota Medicine;* died March 23, aged 90.

Charles French Blake ⊕ Baltimore; College of Physicians and Surgeons, Baltimore, 1893; professor of diseases of the rectum and colon at the University of Maryland School of Medicine and College of Physicians and Surgeons; past president of the Baltimore City Medical Society; fellow of the American College of Surgeons; served on the staffs of Mercy Hospital, Hospital for Women, West Baltimore General and South Baltimore General hospitals; died March 20, aged 79, of coronary thrombosis.

Thomas Philip O'Connor ⊕ Chicago; John A. Creighton Medical College, Omaha, 1914; assistant professor of otolaryngology at Northwestern University Medical School; specialist certified by the American Board of Otolaryngology; fellow of the American College of Surgeons; on the courtesy staff of the Passavant Memorial Hospital; chairman of the department of otolaryngology, Wesley Memorial Hospital where he died March 25, aged 56, of peptic ulcer.

Estes Nathan Blount, Bassfield, Miss.; born in Williamsburg, Miss., in 1874; University of Nashville (Tenn.) Medical Department, 1904; member of the American Medical Association; served in the medical department of the U. S. Army in the Philippines during the Insurrection from 1902 to 1905; served during World War I; for many years secretary of the local school board; died in the Veterans Administration Hospital, Jackson, March 19, aged 73, of paralysis agitans and bronchopneumonia.

Henry Louis Bauer, McComb, Miss.; Atlanta Medical College, 1895; Medical Department of Tulane University of Louisiana, New Orleans, 1898; member of the American Medical Association; past president of the Pike County Medical Society; veteran of the Spanish-American War; surgeon for the Illinois Central Railroad; died March 15, aged 81, of heart disease.

George Washington Betton, Jacksonville, Fla.; University of Maryland School of Medicine, Baltimore, 1895; died March 27, aged 72.

John T. Bird, Pontiac, Mich.; Detroit College of Medicine, 1898; served as county physician for many years; died March 20, aged 76.

Walter Lee Boswell ⊕ Clarendon, Ark.; Memphis (Tenn.) Hospital Medical College, 1913; past president of the Monroe County Medical Society; served during World War I; died in the Baptist Hospital, Memphis, Tenn., March 16, aged 59, of chronic lymphatic leukemia.

Cyrus Everette Bush, Denver; University of Colorado School of Medicine, Denver, 1917; served in the regular navy during and after World War I; member of the American Medical Association; associated with St. Luke's Hospital and Porter Sanitarium and Hospital; died March 27, aged 55, of heart disease.

J. Isaac Campbell, Wytheville, Va.; College of Physicians and Surgeons, Baltimore, 1893; died in Staunton March 13, aged 79.

Edgar Close, Jerusalem, Ark. (*licensed in Arkansas in 1903*); member of the American Medical Association; died in St. Anthony's Hospital, Morrilton, March 15, aged 77, of hypostatic pneumonia.

Alphonse Middleton Crawford, Mount Clemens, Mich.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1924; member of the American Medical Association; president of the Macomb County Medical Society; an officer in the Royal Canadian Air Force during World War I; associated with St. Joseph Hospital where he died March 25, aged 49, of injuries received in an automobile accident.

Charles Camille De Gravelles ⊕ New Iberia, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1910; fellow of the American College of Physicians; past president of the Louisiana State Medical Society; honorary member of the staff of Hotel Dieu; died March 22, aged 64, of coronary occlusion.

Beatrice Pearce Dickinson, Ketchikan, Alaska; Woman's Medical College, Chicago, 1887; died March 16, aged 82.

Willis L. Dixon ⊕ Grand Rapids, Mich.; Loyola University School of Medicine, Chicago, 1916; member of the American Society of Anesthetists, Inc.; past president of the Kent County Medical Society; served during World War I; on the staff of St. Mary's Hospital; died in Corbin, Ky., March 12, aged 57.

Horace Colburn Dodge, Asheville, N. C.; Northwestern University Medical School, Chicago, 1902; served overseas during World War I; at various times manager of the Veterans Administration Hospitals in Memphis, Oteen, N. C., and Fort Bayard, N. Mex.; died in the Mission Hospital March 3, aged 70, of coronary thrombosis.

Henry Bardwell Donaldson, Chicago Heights, Ill.; Northwestern University Medical School, Chicago, 1909; member of the American Medical Association; affiliated with St. James Hospital, where he died March 22, aged 68.

William H. Doncaster, Jeannette, Pa.; American Eclectic Medical College, Cincinnati, 1893; died in the Allegheny General Hospital, Pittsburgh, March 20, aged 82, of carcinoma of the colon.

Wilbur Smith Eaton, Colfax, Iowa; University of Nebraska College of Medicine, Omaha, 1937; served during World War II; died in the Mary Frances Skiff Memorial Hospital, Newton, March 6, aged 43.

Paul Williams Fetzer, Reidsville, N. C.; University of Virginia Department of Medicine, Charlottesville, 1916; member of the American Medical Association; served overseas during World War I; formerly member of the county board of health and the school board of Reidsville; on the staff of the Memorial Hospital; died March 11, aged 59, of lymphosarcoma.

Gilbert Edwin Garvin ⊕ Blanchester, Ohio; Eclectic Medical College, Cincinnati, 1935; interned at the Bethesda Hospital and the Catherine Booth Home and Hospital in Cincinnati; served during World War II; affiliated with Our Lady of Mercy Hospital in Cincinnati; surgeon for the Baltimore and Ohio Railroad; killed in a plane crash at Chicago March 10, aged 42.

Demosthenes John Generales, Lowell, Mass.; National University of Athens School of Medicine, Greece, 1892; died in Baker Memorial Hospital, Boston, March 12, aged 78, of injuries received in a fall on the ice.

Alice Winnifred Graham ⊕ Lincoln, Neb.; Barnes Medical College, St. Louis, 1905; on the honorary staff of St. Elizabeth Hospital; died March 14, aged 72.

Ira Clay Hicks ⊕ Huntington, W. Va.; College of Physicians and Surgeons, Baltimore, 1898; an Affiliate Fellow of the American Medical Association; served as assessor of Putnam County and as a member of the state senate from his district; died in a local hospital March 22, aged 79, of multiple injuries received in a fall.

Edward Marcellus Holmes ⊕ Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1903; affiliated with St. Anne's Hospital; died in Oak Park, Ill., March 24, aged 71.

Garrett Curtiss Jacobus, Wauwatosa, Wis.; Columbia University College of Physicians and Surgeons, New York, 1947; served during World War II; interned at the Presbyterian Hospital in Chicago; found dead March 23, aged 25.

Joseph Isham Jenkins ⊕ Hartwell, Ga.; University of Georgia Medical Department, Augusta, 1900; past president of the Hart County Medical Society; served as a member of the board of regents of the University of Georgia; formerly a trustee of many county schools; died in the Emory University Hospital, Atlanta, March 16, aged 71.

Thomas A. Kerr, Lewiston, N. Y.; University of Vermont College of Medicine, Burlington, 1885; member of the American Medical Association; health officer; served as a member of the school board, village trustee and president of the library; formerly on the staff of Memorial Hospital in Niagara Falls, where he died March 20, aged 84, of arteriosclerosis

William Kerr, Bay City, Mich.; Detroit College of Medicine, 1894; member of the American Medical Association; past president of the Bay County Medical Society; died March 25, aged 82, of acute urinary suppression.

Heman B. Kiehle, Lapeer, Mich.; College of Physicians and Surgeons, Keokuk, Iowa, 1887; helped organize the Ogemaw, Montmorency, Crawford, Oscoda, Roscommon and Otsego Medical Society, serving as vice president at the time of its establishment; formerly health officer of Rose City; died in Lapeer City Hospital March 15, aged 94, of chronic myocarditis.

Errett Le Fever, Glouster, Ohio; Medical College of Ohio, Cincinnati, 1890; member of the American Medical Association; served as a state senator and as a member of the house of representatives; affiliated with the Sheltering Arms in Athens; died March 18, aged 81, of coronary thrombosis.

Alexander Graham Little ⊕ Valdosta, Ga.; Bellevue Hospital Medical College, New York, 1893; member of the Southeastern Surgical Congress; fellow of the American College of Surgeons; co-founder and chief surgeon at Little Griffin Hospital; died April 9, aged 78, of coronary thrombosis.

Carl Carruth Lytle, Dubuque, Iowa; Drake University College of Medicine, Des Moines, 1903; member of the American Medical Association; served during World War I; died March 18, aged 68, of arteriosclerosis.

John MacLean, Los Angeles; University of Toronto Faculty of Medicine, 1911; fellow of the American College of Surgeons; formerly a member of the state board of medical examiners; on the staffs of Los Angeles County Hospital and the Methodist Hospital of Southern California; died March 18, aged 66.

William Henry McOwen, Newton, Mass.; Harvard Medical School, Boston, 1883; member of the American Medical Association; for many years on the staff of Newton Hospital; died in Garden City, N. Y., March 9, aged 85, of heart disease.

Henry Markee, Blandinsville, Ill.; Eclectic Medical Institute, Cincinnati, 1902; died in Manitou Springs, Colo., March 19, aged 85.

John Crocker Medd ⊕ Maplewood, N.J.; Long Island College Hospital, Brooklyn, 1896; for many years assistant medical director of the Metropolitan Life Insurance Company; died in the East Orange General Hospital March 17, aged 81, of miliary tuberculosis and meningitis.

Harry Corwin Moss, Carbondale, Ill.; Missouri Medical College, St. Louis, 1898; member of the American Medical Association; affiliated with the Holden Hospital, where he died March 23, aged 75, of congestive heart failure.

Alfred Chambers Ray Sr., Richmond, Va.; University College of Medicine, Richmond, 1897; for many years college physician for Randolph-Macon College in Ashland; served as medical director of Tidewater Memorial Hospital in Lynnhaven and as physician at the City Home; died March 22, aged 72.

John Francis Ryan, Brooklyn; M.B. in 1915 and M.D. in 1918, Queen's University Faculty of Medicine, Kingston, Ontario, Canada; served with the British Army during World War I; on the staff of St. Peter's Hospital; died March 21, aged 55, of coronary thrombosis.

William Burkhart Scherr ⊕ Morgantown, W. Va.; University of Cincinnati College of Medicine, 1920; past president and secretary of the Monongalia County Medical Society; served in the medical corps of the U. S. Naval Reserve during World War II; served during World War I; died in the U. S. Naval Hospital, Bethesda, Md., March 21, aged 54, of adenocarcinoma of the rectum.

Herbert Julius Schmidt ⊕ Chicago; University of Illinois College of Medicine, Chicago, 1920; formerly clinical instructor in orthopedics at his alma mater; member of the surgical staff of the Englewood Hospital; died in the Research and Educational Hospitals March 21, aged 57, of cerebral hemorrhage.

George Cullison Seitz ⊕ Swissvale, Pa.; University of Pittsburgh School of Medicine, 1912; chief of staff of surgery at the Braddock (Pa.) General Hospital, where he died February 28, aged 66, of cardiorenal vascular disease.

Colin Shaw, Atkinson, N.C.; North Carolina Medical College, Charlotte, 1911; served during World War I; died March 22, aged 57, of carcinoma of the throat.

Benager Columbus Teasley ⊕ Hartwell, Ga.; University of Georgia Medical Department, Augusta, 1900; formerly member of the state board of health; member of the county board of education; died in St. Joseph's Infirmary, Atlanta, March 10, aged 72, of cerebral hemorrhage.

Foreign Letters

LONDON

(From Our Regular Correspondent)

May 29, 1948.

The National Health Service

As foretold in previous letters, the quarrel between the government and the British Medical Association appears about to be composed. The association has again met Mr. Bevin and submitted fourteen questions to him. He has replied with assurance on most of the points to which objection had been taken. Every physician will be free to practice where he chooses unless the area is one in which there are more doctors than are needed. All will be free to choose colleagues, partners and assistants. Partnerships and groups will be free to allocate duties and responsibilities as now, and doctors will be free to decide where an additional partner or assistant is necessary. Freedom of speech and publication within the service on professional scientific and administrative matters is guaranteed.

Existing hospital staffs are given security when they will be taken over by the regional hospital boards. Thereafter it will be the duty of the boards to review the specialist services of their regional members, and they will offer new appointments to their staffs, which they will be free to accept or refuse.

Private pay-bed accommodation has been promised. The minister agrees that in teaching hospitals will be representatives of all consultants and specialists on the staff. Both boards of governors and hospital management committees will include members of the medical committees, and the minister certainly thinks that consultation should include consultation with the medical committee.

The medical profession has certainly gained, as most of its demands have been granted; but the great drawback of the whole scheme is that socialism is imposed on medical practice. Nobody seems to trouble much about that, and when the representatives of the medical profession were negotiating this point was never considered. Perhaps it would have been futile with the labor government in office. The great advances made by British medicine took place under an individualistic system. It remains to be seen what effert socialism with its bureaucratic control will have.

The Fiat Review of German Science

The Foreign Office announces the publication of the first volume of the "Fiat Review of German Science," compiled by German experts under the control of the British, American and French field intelligence agencies (technical). The review, written in German, covers fundamental research in science during 1939-1946. By agreement the first printing is a restricted edition for official distribution between the three allies and UNESCO. The allied edition will be followed by a German one to be published in Wiesbaden. The subjects covered are physics, chemistry, mathematics, medicine, biology and geology. The chemistry volumes include Biochemistry (R. Kuhn), Pharmacology and Toxicology (F. Eicholtz) and Chemotherapeutics (F. Schönhöffer).

The medical volumes include Internal Medicine (R. Schon), Pediatrics (H. Kleinschmidt), Neurology (G. Schaltenbrand), Psychiatry (E. Kretschmer), Tropical Medicine (E. G. Nauck), Hygiene (E. Rodenwaldt), Surgery (K. H. Bauer), Obstetrics and Gynecology (H. Martius), Radiology (H. Holthisen), Physiological and Pathological Chemistry (F. Lenhartz), Pathology (F. Buchner), Bacteriology (H. Schmidt), Virus Diseases (R. Beling and H. Heinlein), Physiology (H. F. Rein) and Anatomy (P. Stöhr).

Change in the Practice of Vaccination

With the coming into operation of the National Health Service Act, compulsory vaccination against smallpox will cease and this vaccination will be placed on the same footing as immunization against diphtheria. The Ministry of Health has therefore issued a memorandum on vaccination that gives the latest views of experts. The routine vaccination of infants during the first few weeks of life before breast or artificial feeding is well established is declared unwise. On the other hand, primary vaccination should be done before the infant is aged 6 months. The site should be the arm, and there should be only one small area of insertion, by the multiple pressure technic. Primary vaccination should not be undertaken in school children or adults except in those exposed to smallpox infection and those required for the armed forces or to undertake foreign travel, as the risk of encephalomyelitis, though small, is greater at school age or later. The frequency of revaccination varies with circumstances. For children primarily vaccinated in infancy it should be both on entering and on leaving school. For the armed forces the routine is to revaccinate at 5 year intervals on home service and 2 year intervals during overseas service.

Gram-Negative Bacteria of the Respiratory Tract

In a communication to the National Academy of Medicine, Drs. M. R. Castex, E. L. Capdehourat and C. Rechniewski report investigations of 378 species of gram-negative bacteria isolated from 1,000 samples of subacute and chronic processes, localized in the different areas of the respiratory apparatus (41 from nasal fossas, 123 from paranasal sinuses, 55 from pharyngeal secretion, 129 from sputum, 30 from pus of pulmonary abscesses and pleurisies). The isolated species are: Escherichia coli (26 cases), Proteus vulgaris (48), Aerobacter aerogenes (20), Klebsiella pneumoniae (239), Pseudomonas aeruginosa (20) and unclassified (23). The importance of these investigations lies in the fact that in comparison with observations made before the era of antibiotic and sulfonamide drugs, in the mentioned diseases the gram-negative bacteria have increased in frequency and quantity. The abundance of the mentioned flora is not only apparent by diminution of the gram-positive organisms, but by real increase of the gram-negative types The reason may be a pathogenic exaltation of the gram-negative bacteria as a consequence of the inhibition of the common pyogenic flora by the use of antibiotics and sulfonamide agents. The authors advise that antibiotic treatment be not used in infectious respiratory conditions, however trivial, without previous knowledge of the nature of the responsible bacteria and the degree of their individual sensitivity against the different medicaments which presumably would be efficient. When such conditions continue for a long time in spite of treatment which is believed to be effective, periodic bacteriologic examinations should be carried out to determine the influence of the administered drugs and also the possible appearance of new refractory species. According to the authors, the use of penicillin has determined the increase of the chronic refractory processes, originated at least partly by the gram-negative bacteria which are insensible to its action. For these reasons it would not be wise to treat a patient exclusively with penicillin or sulfonamide drugs, when a primary or secondary gram-negative flora exists. Penicillin and sulfonamide agents must therefore be used with great caution, whatever way of administration may be elected.

Furthermore, the authors observed that in the serious respiratory conditions of putrid and gangrenous character the gram-negative bacteria coexist constantly with anaerobic forms. The gram-negative organisms are the most difficult ones to inactivate; often they are the residual flora, and therefore responsible for the incurability of a chronic process. If antibiotics are used against those gram-negative germs, it must be done from the beginning in efficient large doses. In many cases streptomycin is preferable to penicillin! The gram-negative bacteria frequently cause intense cutaneous reactions with or without others of symptomatic focal type (allergic). The gram-negative organisms, especially Esch. coli, produce penicillinase, which inactivates penicillin and which can explain the failure of local treatment. The increase of gram-negative forms increases also the production of penicillinase, thus decreasing more and more the effect of penicillin.

Brief Items

Professor C. Bonorino Udaondo has been elected president of the National Academy of Medicine for 1948-1949.

The Argentine government has given 36,000,000 pesos to the city of Buenos Aires for improvement of the hospital services.

Dr. Oscar Ivanissevich, until now Argentine ambassador in Washington, D.C., has been nominated secretary (minister) of education in Buenos Aires. He is the first chief of a new secretariate which replaces the section of public instruction, which was formerly a part of the Ministry of Foreign Affairs. Professor Roque A. Izzo has been named interventor of the Medical Faculty at Buenos Aires. Professors Pedro L. Errecart (otorhinolaryngology), Venancio Deulofeu (biologic chemistry) and Adrian J. Bengolea (surgery) have been elected members of the National Academy of Medicine at Buenos Aires. Dr. Herbert Wade of the United States of America has been in Buenos Aires visiting the leprosariums and preparing the next International Leprosy Conference, which will be held in April in Havana, Cuba.

For the first time in the Argentine Republic an extensive private postgraduate course has been organized, by Professor Pedro Cossio. The best teachers and clinicians in surgery, cardiology, endocrinology, clinical hematology, gastroenterology, hepatic diseases and roentgenologic diagnostic procedures have participated. At the end of the course, in which one hundred and fifty-nine Argentine and Latin American physicians participated, the president of the Argentine Medical Association, Professor José Valls, called special attention to the great success of this event.

Professor Enrique Finochietto, well known Argentine surgeon, died on February 17, aged 66.

The Time of Total Circulation

Drs. Alfredo Lanari and F. Labourt reported to the Argentine Society of Cardiology their new method which permits the determination of total time of circulation by means of inhaling acetylene through one lung and collecting, at certain intervals, samples of air expired from the other lung. Owing to the great technical difficulties this method can only be used for experiments or for the diagnosis of certain congenital diseases of the heart.

SPAIN

(From Our Regular Correspondent)

MADRID, May 25, 1948.

Public Health in Spain

Much improvement has been made in public health in Spain during the last nine years under the direction of Dr. J.A. Palanca and the Ministry of the Interior, whose head is senor Blas Perez. According to the Public Health Department, the comparative figures are as follows:

Years	Population	General Mortality	Infant Mortality
1935	24,583,096	15.6	109
1946	27,285,489	12.7	87

The mortality rate for 1946 in Spain is close to that of countries most advanced in matters of health; and although the statistics of infant mortality are based on a somewhat different criterion of "living children," it is evident that our general improvement has kept pace with the evolution of therapeutic means. The success in public health work has been due in part to the amounts assigned in the budgets. In 1935, the Public Health Department's estimate was 33,000,000 pesetas, whereas in in 1947 the figure was 173,000,000, including, besides assignments in the Public Health estimates properly so called, those from the Social and Charitable Help Fund (8,000,000), Surcharges and Lotteries (4,000,000) and Provincial Health Institutes (29,000,000).

In the nine years, the following laws have been enacted: National Public Health (1944), superseding the Act of 1854; Fight against Tuberculosis (Dec. 13, 1943); Children's and Mothers' Health (July 12, 1941); Repression of Abortion and Protection of Child-Bearing (Jan. 24, 1941); Extension of Maternity Insurance Benefits (July 18, 1942); state payment of physicians in the last three classes of the Visiting Public Assistance Services (Dec. 31, 1941); credit for improvement and other emoluments to doctors in the last three classes of the Visiting Public Assistance Services (July 22, 1942). Finally, a law enacted on July 17, 1947, established a bonus of 2,000 pesetas a month for doctors holding appointments under the Visiting Public Assistance Scheme, 1,500 pesetas a month for municipal pharmaceutical inspectors and 30 per cent of the aforesaid doctors' bonus for surgeons' and physicians' assistants and mid-wives in these visiting services. Some of these laws have not yet been fully carried out in practice.

Health Institute

In the course of these years, the Public Health Department has erected ten provincial health institutes, rebuilt five which were destroyed in the civil war and has eight more in course of construction and two about to be opened, while enlargement of three others is being planned. It has created thirty rural hygiene centers, 133 puericulture clinics, fifty emergency maternity and pediatric centers and 90 maternology clinics.

The National Health School, which was further founded before the advent of the new state, has been given impulse. New creations are the Spanish Haematology Institute, the National Health Instructresses Training College, an institute of collapsotherapy within the framework of the fight against tuberculosis; the puericulture schools at Barcelona, Bilbao, Malaga, Murcia, Santa Cruz de Tenerife, Valladolid, Saragossa and Jaen. The Madrid School of Puericulture has been rebuilt. To the present Public Health Department we also owe the Leper Hospital at Trillo, the Mental Hygiene

Clinic at Barcelona, a mental hygiene center at Vallecas (Madrid), a new disinfection center at Baracaldo and a Mental Hospital at Segovia.

For the excellent results in the fight against tuberculosis, the Spanish people are indebted to the Minister of the Interior, Blas Perez.

The comparative figures, under this heading, for eleven years are as follows:

Year	Clinics	Sanatoriums	Beds	Estimates, Pesetas
1936	33	20	2,109	2,000,000
1947	120	70	9,615	123,588,563

An additional 11,514 beds will soon be made available and 3,830 more are in project.

Effective work has been done against venereal disease and leprosy. There are one hundred and forty-one doctors and seventy clinics in these services. The old name "Anti-Venereal Dispensaries" has been changed to "Dermatological and Social Hygiene Clinics." The sulfamides and more particularly penicillin are contributing efficaciously in this fight.

In the campaign against leprosy, the government has put new ideas into practice. We have the Leprological Institute and the Central Leprosy Sanitarium at Trillo, with one hundred beds now available and other wings in construction. Another leper hospital is being built at Toen (Orense) and another at Abona (Tenerife).

A group of leprologists has been organized and merged with that of physicians to the official dermatologic clinics. In all provincial hospitals in leprosy-infected areas, wards with beds for patients with leprosy have been opened by decree. The yearly estimates for the fight against leprosy amount to 987,233 pesetas, 7,467,592 pesetas having been invested in the building of leper hospitals or wards and subsidies to the antileprosy establishments at Fontilles, Malaga, Granada, Corunna, Las Palmas, Tenerife and Madrid (Hospital of St. John of God).

In the field of other infectious diseases the Public Health Department has done excellent work. Compulsory vaccination against diphtheria has been most efficacious. This work started with the experience gained in 1939-1940 by means of the vaccine supplied by the United States and Great Britain. In 1940-1941 there was an outbreak of smallpox which was well studied in the special wing of the National Hospital for Infectious Diseases, and suppressed. There is no longer any problem.

Malaria

In the fight against malaria there were 202 clinics in 1936 and, in 1947, the number had increased to 321. The money spent on antimalarial drugs amounted on an average to 250,000 pesetas, ten years ago, but since 1940 the yearly average is 2,500,000 pesetas, while in 1943, when malaria underwent a new increase, it rose to 4,000,000. In this fight the DDT group of insecticides has been used with great success.

On the other hand, the fight against cancer, in spite of excellent intentions of the Public Health Department, has lagged. According to the report issued by the department, a large scale plan is being worked out. Nevertheless, the old Cancer Institute, which was directed by Dr. Pio del Rio Ortega, who died in exile in Buenos Aires, is practically paralyzed; it has no premises of its own since the old ones were destroyed in the civil war. At present, the institute is directed by Dr. J. Sanz Ibanez, professor of histology and pathologic anatomy in Madrid University.

The work of the General Pharmacy Inspectorate tends to raise the scientific and financial standard of pharmacists, regulate the location of drug stores and favor the development of the national industries and the provident institutions, particularly the Pharmacists' Orphanage.

The Public Health Department supplies official health centers with narcotics, and emphasis must be laid on the foresight exercised during the war and the postwar period in the opium problem and, later, with regard to the distribution of penicillin. The General Pharmacy Inspectorate has created a body of municipal pharmaceutical inspectors, into which entrance is by competitive examination, and a medicinal plant department to encourage the growing and the use of those occurring in Spain.

In the sphere of ocular hygiene, the number of ophthalmologists in the Provincial Health Services has been increased to fifty-two, and new clinics have been opened, there being now a total of fifty-three ocular hygiene departments, of which there were seventeen in 1936. Nearly all the antitrachoma clinics that were destroyed in both zones in the civil war have been rebuilt and equipped. At Aguilas (Murcia) an antitrachoma center has been built with beds for patients; that district is widely infected with this disease, but the number of cases here has dropped from 31,651 before the civil war to 29,442 in 1946.

Recently created were the National Food Trust and the National Food Institute. Thanks to the Public Health Department and the Nutrition Department of the Medical Research Institute and the Supplies Commissariat, in 1943 or thereabouts it was possible to cut short an epidemic of lathyrism which had become alarming. Feeding in the poorer suburbs is of great concern. The authorities have had statistical studies made, some of which, already published, are of scientific importance.

Institute of Haematology

In 1940, the Spanish Institute of Haematology was created. This institute deserves special mention. The state contributed 1,300,000 pesetas for the purchase of the building and its adaptation, repairing and enlargement, and 2,556,127.11 pesetas from 1940 to 1947 for its maintenance. The Institute is directed by Dr. C. Elosegui. The following services have been rendered to date: 20,383 transfusions (142 in 1940, increasing to 4,842 in 1946) and 5,319 cases have been attended to in the plasmotherapy outpatients' department. Teaching also has been given to Army, Navy and Air Force doctors ever since 1942. The institute cooperated in the drive to do away with the epidemic of exanthematic typhus in 1941 and 1942, statistics of which are published in the *Anales del Instituto de Hematologia*. It also helped to deal with the outbreaks of typhoid and in the production of serums against measles, scarlatina and infantile paralysis, and is the only center now preparing and sending all over Spain serums for defining the blood groups.

As regards the visiting public assistance doctors' corps, the salaries of such physicians has been increased in recent years by 1,000 pesetas a month for all classes and the state has undertaken the payment of those in the three lower ones. The state has also furnished a credit of 7,000,000 pesetas for improvements to the latter and a benevolent fund has been opened for doctors holding appointments. Seven competitions have been held in the last few years, 8,886 appointments have been made, and three competitive examinations have been announced.

By Act of July 17, 1947, a bonus of 2,000 pesetas a month was established in favor of appointed doctors; of 1,500 pesetas for municipal pharmaceutical inspectors, and of 30 per cent of the doctors' amount for *practicantes* and midwives in the visiting assistance services.

Medical Economics

ABSTRACTS OF RECENT MEDICAL ECONOMIC WRITINGS

NOTE: Following are abstracts of and comments concerning recent publications on medical economic subjects prepared by the staff of the Bureau of Medical Economic Research.--Ed.

URBAN COST OF FAMILY LIVING

THE CITY WORKERS FAMILY BUDGET. By Lester S. Kellogg and Dorothy S Brady. MONTHLY LABOR REVIEW, U. S. Department of Labor pages 133-170, February, 1948.

This study was undertaken to determine the cost of family living in large cities Four-member families in thirty-four large cities throughout the country were surveyed, and a standard budget was devised at a level which "meets prevailing American standards of what is necessary for health and decent living." The concept of "necessary" used by the Bureau of Labor Statistics includes conventional and social as well as biologic needs; it indicates a modest rather than a minimum standard. The quantities of certain items included in the budget were determined by scientific requirements set up by authorities (such as the Food and Nutrition Board of the National Research Council and the American Public Health Association's Committee on Housing Hygiene) where such standards exist; in other cases, the relation between amounts of the item bought and amount of family income were charted, and the point where increases in buying showed a relative decline was used as the budget level. The cost of items in this basic budget were priced for March 1946 and June 1947. The resulting figures showed the greatest variation between cities to be $375 (from $2,734 in New Orleans to $3,111 in Washington, D.C., in 1947).

The bureau points out that it has no actuarial standards formulated by the members of the medical profession to aid it in determining medical care requirements. It arrives at a budget allowance for medical care ranging from $127 to $202 in 1946 and from $132 to $222 in 1947. This amounts to from 5 to 7 per cent of the total budget, and shows a greater percentage of the total going for medical care in 1946 than in 1947 when incomes were higher. Of the sum spent for medical care, 75 per cent went for medical and dental services 13 per cent for hospital expenses and 11 per cent for medicine and eyeglasses. Almost all the increased expenditure between 1946 and 1947 went for medical and dental services, the amount spent on the other medical care items remaining nearly constant. The budget level for visits to physicians was established at 4.4 calls per year per person; for dental visits, at one plus per year per person Two fifths of the medical and dental costs were incurred by the wife of the family of four; the other members shared the remainder more or less equally.

The Bureau states that the standard represented by these medical care items is characteristic of an income level above the other groups of goods and services included in the budget, and that therefore the majority of American families receive " inadequate" service. The validity of this conclusion depends on the assumption that the budget levels for visits to physicians and dentists is accurate. Without passing judgment on the methods used in the Bureau's study, the figure of 4.4 physician calls per year per person seems excessive when compared with the maximum average of 3 calls per year per person over 65 years of age receiving free care in the state of Washington. In any case, the bureau is certainly not justified in extending conclusions derived from a study of a particular type of family to the majority of American families.

Assuming the correctness of the bureau's estimate of an "adequate minimum" of medical care for its typical urban family, the budget items for medical care are larger than typical amounts actually spent by families in a corresponding income group ($3,200). Moreover, 5 to 7 per cent of the budget for medical care items is far in excess of the national average of 3.9 per cent in 1946. (Cf. Is Medical Care Expensive?, Bureau of Medical Economic Research, American Medical Association, 1947, 12 pp.). Aside from possible rural-urban differences in percentages spent for medical care, these discrepancies could be due to the composition of the Bureau's typical family - a father aged 38, a mother aged 36, son aged 13 and a daughter aged 8 years. It has never been demonstrated that low income families of a fixed size, age and sex distribution spend a higher percentage of their budget for medical care than do similar families in higher income classes, as implied by Engel's Law of Expenditures. It is, however, well established that young fathers of young children are not receiving their maximum lifetime earnings, although their medical care costs are likely to be at the lifetime maximum, except for the period of old age. Had the Bureau's typical family been ten years older, its income would probably have been greater and its medical care costs less. If the members were five to seven years younger; the medical care costs would probably have been somewhat higher, the income of the father somewhat lower, and, of course, the persentage of the family budget spent for medical care would have been even greater

Even if this medical budget is typical for the family specified by the authors it is excessive for most families in the nation. The authors have been wise to confine their discussion to a relatively young family in an urban community. Even they would not claim that their data were applicable to an old family. It should soon be possible to build a family budget for medical care items in most cities by reference to family premium rates for group hospital and medical care plans which cover most of the costs of major but not of minor illnesses; they seldom cover dental costs. Doubtless the two authors, both well known statisticians, would welcome that simplification of the painstaking task of developing one part of a family budget. The Bureau did make use of the premium rates for group hospitalization plans in cities where such plans covered a sizable proportion of the population.

REVIEW OF ILLUSTRATIVE UNITED STATES POPULATION PROJECTION, 1946

Assuming that low fertility produces a decrease in total population and high mortality decreases the number of aged persons, and the reverse, that high fertility produces an increase in total population and low mortality increases the number of aged persons, estimates of total population one hundred years hence can be obtained.

In the report here discussed[1] population figures for 1945 were projected for the next hundred years. Projections were based on the population of the United States as of July 1, 1945, as estimated by the Bureau of the Census.[1]

---

eyers, H. J.: Illustrative U. S. Population Projection, 1946, Actuarial Study no. 24, Federal Security Agency, Social Security Administration, Office of the Actuary. January 1948.

1. Population Special Reports, Series P-46, no. 2, United States Department of Commerce, Bureau of the Census, Jan. 27, 1946.

Four projections were made: A assumes a low fertility and high mortality without calculation of immigration (2050 A. D. population—63,521,000); B assumes a high fertility and low mortality. This estimate includes an expected 100,000 immigrants per year (2050 population—372,755,000); C assumes a high fertility and high mortality. Immigration estimates were not included (2050 population—264,014,000); D assumes a medium fertility and low mortality. Immigration estimates were not included (2050 population--153,198,000).

Figures for projection A show a decreasing population trend with a slight peak occurring in 1960 (143,417,000 as compared with 140,434,000 in 1945). However, beyond 1960 the decreasing trend continues to 63,521,000 in 2050. Decrease in this instance is due to the low fertility and high mortality effects described. Greatest numbers of persons occur in the age group 20 to 44 but all groups decrease in size. Projection B demonstrates the opposite effect The population increases; in 2050 it reaches 372,755,000, two and a half times the 1945 figures In this instance all age groups increase in size Projection C demonstrates an increasing trend, but lesser than that in B. The total population estimate in 2050 is 264,014,000, double the base figure Obviously most static effects appear in projection D, in which total population reaches a peak 173,312,000 in 2000, then declines slightly but still remains above that of 1945. Age groups in this projection are more constant.

The highest percentage of population always falls in the age group 20 to 44. With the high fertility rate assumed in projection B the under 20 year group is ten times the same figure for A. For the group aged 65 and over the numbers of persons increases in projection B and projection C, with the latter increasing at a less rapid rate. Projection A produces the reverse picture showing a decline after 2010 while D demonstrates a leveling off after 2010. All curves demonstrate a hump at the year 2000 followed by a slight dip and a secondary rise. This result is due to the varying numbers of births during the depression period and the subsequent postdepression period.

Groups which decrease in size when calculated as percentages of the total population are those under 20 years and 20 to 44 years. The remaining two groups, 45 to 64 years and 65 years and over, tend to increase In projection A the first age group decreases almost half whereas the last age group almost triples itself Projection B is stationary except for the 65 year and over group which approaches twice the 1945 figure. Projection C is similar to B in that the group size does not change radically. Projection D follows the same pattern as A but the change is less well defined.

Little sex variation occurs in projections A and C, but B and D show relative increase in numbers of males. This increase is due partly to immigrants. The little variation that does appear in projections A and C demonstrates the relative numbers of males to be decreasing. For the aged population the ratios remain about the same; a slight decrease for A and C and a slight increase for projections B and D. Mortality among females has always been slightly lower than among males The number of nonwhite persons increases in all projections. The greatest increase in this category appears in projections B and D.

MEDICAL SERVICE PLANS UNDER COLLECTIVE BARGAINING:

Monthly Labor Review 66:34-39 (Jan.) 1948.

This study describes briefly two medical service plans established under collective bargaining: the Labor Health Institute in St. Louis and the Union Health Center in Philadelphia. Both plans started in the war years, when wage increases were hard to get for reasons other than economic and tax benefits made welfare plans particularly suitable substitutes from the point of view of employers. The Philadelphia center was initiated by a local board of the International Ladies' Garment Workers' Union; the St. Louis center by the United Retail and Wholesale Union, Congress of Industrial Organization. The International Ladies' Garment Workers' Union had the precedent of a health center already operating in New York and set up what amounts to a group diagnostic clinic providing service free to referred ambulatory persons who are eligible. Specialist services not offered are obtained elsewhere, the center paying the bill. Pharmaceuticals and appliances are available at reduced fees. Dependents get the services of the center at low fee for service rates. Annual physical examinations at the center are free for eligible persons; other than this, no person receives care at the center unless referred by his private physician. The center is financed by one third of a total employer payroll contribution of 6 per cent. The balance of the contribution is used for vacations, unemployment insurance and administrative costs.

The St Louis center was set up without a union health center to serve as a model Instead, experience of certain personnel in the cooperative health movement was utilized. Those eligible are offered what the medical director calls " portal to portal" medicine-complete care. Hospitalization is handled through the Blue Cross; the center handles all the other required services, including dentistry, social work and psychiatry. Pharmaceuticals and appliances are available at reduced cost. Funds come from a 3½ per cent employer payroll contribution

Each center experienced difficulty at first in getting eligible persons to make use of the facilities offered. The St. Louis center has maintained an aggressive policy of health education and has taken as clients groups other than the initiating union. The Philadelphia center has not attempted to expand its services. The medical staff of each center works part time, at hourly rates of $5 in St. Louis and $6 in Philadelphia. Medical staffs appear to have considerable autonomy. Employer acceptance of the centers has been greater in Philadelphia, attributable to the fact that in the needle trades the tradition has become accepted that employers share responsibility for employees. It is expected that in depression employers will attack this type of plan on the basis of its cost.

ANNUAL REPORT OF THE FEDERAL SECURITY AGENCY. SECTION ONE. SOCIAL SECURITY ADMINISTRATION:

For the Fiscal year 1947. Washington, D.C., United States Government Printing Office, 1948

This report describes the operations of the Social Security Administration for its first year under that name; it makes recommendations for the extension of social security in accordance with section 702 of the original Social Security Act. These recommendations provide a forecast of the testimony of Social Security employees in future hearings on bills pertaining to health and related matters. The following are some explicit assumptions on which the argument for expanded social security services are based: (1) Present provisions are incomplete in coverage of risks and of persons. (2) The extent of protection for persons insured against similar risks varies greatly. (3) The preservation of free competition and democracy cannot be possible unless the larger forms of insecurity are removed from our society.

The Administration recommends "that our present programs of social insurance should be broadened into a comprehensive basic national system of contributory insurance." Persons falling between the cracks of this system should be cared for by specific welfare programs, " including public assistance and family and child welfare services." The insurance aspects of this recommendation are shown to contribute to free enterprise and democracy by protecting persons from the economic hazards of life, to some degree; in short, it is argued that this insurance is required in order to preserve 'the economic ability to make free choices. The welfare aspects are said to be in the old tradition of public provision of special services where no private method is suitable to fill a recognized need.

Compulsory health insurance is listed among the items in the services which should be added. There is nothing new in the arguments for this aspect of social security, except its presentation in the larger context as one of several programs, all of which are said to require expansion.

UNION-MANAGEMENT WELFARE PLANS: ROBERT J. ROSENTHAL. Quart. J. Economics 62:64-94 (Nov.) 1947 (Includes a large tabular presentation of details of many labor-management and labor plans).

Labor's policy in the early twenties was to favor union-controlled and financed benefit plans. Employer-sponsored plans then were considered labor-busting devices. Compulsory health insurance was frowned on in favor of labor's own. The depression wiped out most of these plans. Bargaining in the thirties was on matters of wages and hours. Not until the war froze wages did welfare plans appear as a means to get further benefits—something for labor's negotiators to bring home from the negotiation table and a device for employers to keep from paying excess profits taxes.

The spate of labor-management plans that blossomed during the war years have varying degrees of labor control. Many use private insurance carriers. Most involve employer contributions on the basis of total payroll; only one or two plans base the employers' contributions on gross output - as does the United Mine Workers' plan (imported from England in this regard).

Labor in general thinks of these plans as a temporary stopgap, until the Wagner-Murray-Dingell Bill becomes law. The existence of welfare plans on the negotiation agenda is to a large extent dependent on the relative bargaining strength of labor—these plans appear only after all possible wage demands have been exploited. Tougher times will see less of these plans, as bargaining reverts to the hoary issues of wages and hours.

BUDGETING THE COSTS OF ILLNESS: H. LADD PLUMLEY, National Industrial Conference Board, Studies in Individual and Collective Security No. 1, 1947.

This sixty-six page pamphlet discusses in general terms the nature of voluntary health insurance plans in the United States. The pamphlet is not well documented and should be considered a secondary source. Discussion of employee mutual benefit associations is based chiefly on a ten year old study in *Public Health Reports*. The conclusion is that this type of insurance will not expand significantly. Comment on trade union plans mentions the difficulty experienced by unions operating such plans and states that the trend is toward no more plans organized by unions alone. A long table, for which no source is listed, gives data on contemporary union benefit plans. There is a brief discussion of Blue Cross development, totally undocumented, which omission is not serious since the data are all available in other convenient sources. Coverage of prepayment medical care plans includes an interesting brief historical sketch and mentions the need for the American Medical Association to publish actuarial data on these plans. Discussion of individual policies sold by private insurance companies carries the cautionary statement that these policies often combine health clauses with accident and other provisions. The conclusion is that voluntary health insurance is advancing on a broad front with many different types of plans; that the period of experimentation is over and that extension of coverage through existing mediums is to be expected.

COMMUNITY HEALTH SERVICES FOR CHILDREN IN EIGHT STATES: CHARLES L. WILLIAMS JR., M.D.; JOHN P. HUBBARD, M.D., and KATHERINE BAIN, M.D.: Am. J. Pub. Health 38:75-81 (Jan.) 1948.

This is a brief preview of the results of the Academy of Pediatrics-Public Health Service-Children's Bureau survey of child care in the United States. This article presents bar-diagram comparisons of well child conferences and public health nursing services available in a sample of counties, broken down into the interesting classification developed for this study according to density of population and adjacence to dense population.

MEDICAL CARE OF THE INDIGENT AGED IN WASHINGTON STATE

FRANK G. DICKINSON, Ph.D.
Director, Bureau of Medical Economic Research
Chicago

Washington state has provided medical care for the recipients of old age pensions; they constitute about two fifths of all the residents of Washington over 64 years of age. In 1941 the voters approved Initiative No. 141, "The Senior Citizens Grant Act," establishing a new method of handling the medical care costs of the approximately 60,000 citizens of that state who receive old age pensions. Mr. Odin W. Anderson presents an analysis of this program in his book "Administration of Medical Care: Problems and Issues" (Research Series 2, Bureau of Public Health Economics, School of Public Health, University of Michigan, Ann Arbor, Mich., 1947).

This study covers the four year period April 1941 to March 1945; the plan was in operation until April 1947. The biennial appropriations rose from $5.5 million to $8 million or from $44 to $68 per year. The services included medical, dental, hospital and nursing care, drugs and appliances. Free choice of physician and fee for service were provided; basic fee schedules were worked out with the state medical, dental and hospital associations. The policy-making, supervision, finance and record-keeping operations were handled by the state department of social security; the actual administration of the program at the local level was conducted by the county welfare departments. There were both state and county medical-dental advisory boards. The county medical service bureaus, which have played such a prominent role in the development of the prepayment medical care program of organized medicine in the state of Washington, handled the medical, dental and drug aspects of the program.

In addition to the increase in cost, which Mr. Anderson does not place into a frame of reference, several other shortcomings are noted in the operation of the plan and have doubtless been among the reasons for discontinuing the program in April of 1947. Mr. Anderson contends that the large amount of control exercised by the representatives of the county and state medical societies was detrimental and that a better plan would have provided more control by government and less by the profession. By September of 1941, about a half year after the program started, over half of the licensed physicians and dentists were participating in the program. In 1944 the gradual withdrawal of participants started, according to Mr. Anderson, with the downward revision of the fee schedule. He also complains of red tape that was involved, especially at first, in submitting claims and keeping records

Some of his over-all statistics are most interesting. Each month one fifth to one fourth of the persons over 64 years of age who are receiving old age assistance saw a physician and 5 per cent were in institutions. Annual home and office calls per recipient varied from 2.4 to 3, a surprisingly high rate of utilization. The percentage of recipients requesting physician's services rose steadily, from 19.2 per cent in the last quarter of 1941 to 27.5 per cent in the first quarter of 1945. On the contrary, the number of dental visits decreased, probably reflecting the considerable number of accumulated dental deficiencies which were eliminated in 1941 soon after the plan was inaugurated. The monthly percentage of recipients hospitalized rose from 1.6 to 2.7. The proportion of cases handled by the county hospitals increased slightly during the four years from 61 to 64 per cent, although the average number of days for hospitalization per patient remained almost constant in private hospitals while increasing about one half in county hospitals. Per capita cost of drugs rose from 15 cents a month to 65 cents. Two thirds of the entire $600,000 expenditure for appliances was made during the first two years.

The monthly per capita cost of the program rose from $3.75 to $6.32, the cost of the services of physicians and dentists remained relatively constant in dollars while the costs of all the other services rose. The physician's share of the total declined from 60 to 40 per cent.

Funds were allocated to the counties according to the number of persons receiving old age assistance. Mr. Anderson contends that this plan of distributing the funds eliminated all connection between the services actually needed as compared with those rendered. He suggests that if any other states seek to model their plan of medical care for the indigent aged on the Washington experience, they should make certain that the law is specific as to services and practitioners to be included. He advocates a period of preparation before the program actually goes into effect. He further argues for an integration of the agency in control with other governmental departments which have medical care functions. He also finds certain shortcomings in the records necessary to provide a clear picture of the actual cost of medical care under the program. Last, he supports the general thesis that the medical care program financed out of public revenues must have some controls on the volume and cost, although such controls will certainly not be popular with the recipients and probably not with some of the providers of the medical services.

This law of 1941 was superseded after Mr. Anderson's book went to press and the responsibility for the care of aged recipients was returned to the counties on April 1, 1947. As the number of persons in our population who are in the group over 64 years of age increases to perhaps 20,000,000 in a few decades, this question of medical care for the indigent aged will force itself increasingly on the attention of all those interested in medical economics. Mr. Anderson's study is a valuable addition to the literature on medical economics.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and the Examining Boards in Specialties were published in THE JOURNAL, July 3, page 903.

BOARDS OF MEDICAL EXAMINERS

ALASKA: * *Examination* Juneau, Sept 7 Sec., Dr W. M. Whitehead, Box 140, Juneau

CALIFORNIA: *Oral.* Los Angeles, Aug 7-8. *Written* Los Angeles, Aug 9-12, Sacramento, Oct 18-21. Sec., Dr. Frederick N. Scatena, 1020 N Street, Sacramento 14

CONNECTICUT: * *Examination* Hartford, July 13-14 Sec., Dr Creighton Barker, 258 Church St., New Haven. *Homeopathic Examination.* Derby, July 13 Sec., Dr J H Evans, 1488 Chapel St., New Haven.

DELAWARE: *Examination* Dover, July 13 *Endorsement.* Dover, July 22 Sec., Dr J S McDaniel, 229 S. State St., Dover.

HAWAII: *Examination* Honolulu, July 12-15. Sec., Dr. S. E. Doolittle, 881 S Hotel St., Honolulu

IDAHO: Boise, July 13-15. Sec., Bureau of Occupational Licenses, Miss Estella S Mullner, 355 State House, Boise

IOWA: * *Examination* Des Moines, Dec 6-8. *Endorsement* Des Moines, Aug 2 Sec., Dr M A Royal, 506 Fleming Bldg., Des Moines

MASSACHUSETTS: *Examination* Boston, July 13-16 Sec., Board of Registration in Medicine, Dr H Q Gallupe, 413-E State House, Boston.

MISSOURI: Jefferson City, Aug 8 Exec. Sec., Mr. J. A. Hailey, Room 135 Capitol Bldg., Jefferson City

MONTANA: Helena, Oct 4-6. Sec., Dr. O. G. Klein, First Nat'l Bank Bldg., Helena

NEVADA: Carson City, Nov. 1. Sec., Dr. G H Ross, Industrial Bldg., Carson City

NEW HAMPSHIRE: Concord, Sept. 9 Sec., Board of Registration in Medicine, Dr J S Wheeler, Room 107, State House, Concord.

NEW MEXICO: * Santa Fe, Oct 11-12. Sec., Dr V. E. Berchtold, 141 Palace Ave Santa Fe.

NORTH CAROLINA: *Endorsement* Morehead City, July 22. Sec., Dr. Ivan Procter, 226 Hillsboro St., Raleigh

OREGON: * *Examination* July 28-30 Final date for filing application is July 14 *Endorsement* July 30-31 Final date for filing application is July 16 Sec Miss L M Cathee 608 Failing Bldg Portland

SOUTH CAROLINA: *Endorsement* Aug 2, Sept. 6. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia

SOUTH DAKOTA: * Pierre, July 20-21. Sec., Dr. Gilbert Cottam Capitol Bldg., Pierre

WASHINGTON: * *Examination* Seattle, July 12-14 Act Dir., Dept of Licenses, Mr G C Starlund, Sec., Miss Virginia Witherspoon, Olympia

* Basic Science Certificate required

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ALASKA: Juneau, Last week in Aug Sec., Dr C. Earl Albrecht, Box 1931, Juneau

FLORIDA: *Examination* Gainesville, Nov 6 Final date for filing application is Oct 25. Mr M W Emmel, University of Florida, Gainesville

IOWA: Des Moines, July 13, Oct 12. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids

MICHIGAN: *Examination.* Ann Arbor and Detroit, Oct. 8-9. Sec., Miss Eloise LeBeau, 1510 West Allegan St., Lansing.

MINNESOTA: *Examination* Oct 5-6. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

NEBRASKA: *Examination* Omaha, Oct 5-6 Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, Room 1009 State Capitol Bldg., Lincoln

OKLAHOMA: Spring of 1949 Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

OREGON: *Examination.* Portland, Sept. 4 Sec., Basic Science Examining Committee, Dr. C. D. Byrne, Univ of Oregon, Eugene.

WISCONSIN: *Examination.* Madison, Sept 25 Final date for filing application is Sept. 18. Sec., Prof. W. H Barber, Scott & Watson Sts., Ripon.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Right of Corporation to Pratice Optometry.—This was a quo warranto proceeding to oust the defendant, Standard Optical Company, from its corporate rights and privileges. From a judgment for the defendant, The state appealed to the Supreme Court of Oregon.

The defendant, an Oregon corporation, was organized in December 1940 "to operate and carry on a a general optical and merchandising business in all its branches, including manufacturing, buying and selling, at wholesale and retail, for cash or on credit, all optical goods and accessories thereto, and other merchandise which can be sold in optical stores, including fountain pens, radios and jewelry." In each of its stores it employs a registered optometrist as manager and salesman, whose name, as "Registered Optometrist in Charge," is displayed in the store. The defendant advertises that the registered optometrist will, for the convenience of the public, make eye examinations, and contended that he makes such examinations without charge to the customer, whether or not eyeglasses are needed and whether or not glasses, if needed, are purchased from him.

Where the right to practice a profession is conditioned on pursuit of a course of specialized training, the acquiring of a diploma, the passing of an examination, and the furnishing of a certificate of good moral character, said the court, it is obvious that a corporation cannot comply with such requirements. The defendant insisted, however, that public policy does not prevent a corporation from offering the skilled services of a licensed professional man as an adjunct to its own business, as long as it publishes the fact that such professional man is an employee. The defendant argued that such an arrangement does not involve professional practice by the corporation-employer unless the benefit derived by the employer is directly related to the professional work performed. This argument is beside the point, said the Supreme Court. The underlying reason for the regulation of the professions of law and medicine by the state is that the practitioners thereof "render services which are either vital or fiduciary in a high degree and which may be required at a moment's notice by any member of the public, however ignorant. Therefore, if the competent practitioners were not clearly distinguished, the mass of the public would fall into the hands of quacks when their most fundamental needs were at stake." It is true, the court continued, that the employment of professional men by corporations is commonplace. For example, there are so-called "company doctors," "company engineers" and "company lawyers." Those practitioners, however, do not offer their services to the public at large but only to the employer.

The Oregon optometry act specifically designates optometry as a profession and imposes on optometrists standards of qualification of such a high order that they may well be termed professional standards. It was undoubtedly the intention of the legislature in adopting the optometry act to promote the health, safety and welfare of the people of the state. Such regulation of a profession, the practice of which affects the vital interests of the people, said the Supreme Court, is a proper excercise of the police power. The prohibition of the practice of optometry by unlicensed persons would be rendered ineffective if corporations were permitted to furnish optometric services through salaried employees who are licensed optometrists. The defendant argued, however, that optometry is not a profession. Quoting from a prior Michigan case, the Supreme Court of Oregon said: "As to optometrists, there seems to be a conflict of authority. Undoubtedly the fitting and sale of eyeglasses began as a trade and not as a profession. There is some support in decided cases for the proposition that it must remain a trade, in which an unlicensed person or a corporation may engage as of right, provided the actual work is done by a skilled servant duly licensed. The considerations to the contrary seem to us more weighty. In recent times abnormalities of the eye, like those of the teeth, have been found sometimes to indicate and often to result in serious impairment of the general health. The work of an optometrist approaches, though it may not quite reach, ophthalmology. The learning and the ethical standards required for that work, and the trust and confidence reposed in optometrists by those who employ them, cannot be dismissed as negligible or as not transcending the requirements of an ordinary trade. We cannot pronounce arbitrary or irrational the placing of optometry on a professional basis." It would seem that the public has as much need to be protected from quacks and charlatans in optometry as in dentistry or any other subdivision of medicine. One who consults an optometrist for ocular examination is entitled to the same undivided loyalty that he should receive from a physician. The fact that the optometrist is the employee of an optical concern whose main interest is the sale of optical goods tends to be a distracting influence which may adversely affect his loyalty to the interests of his patient. When a customer visits the defendant's store seeking an eye examination, the receptionist refers him to the optometrist, who makes the examination. If eyeglasses appear to be needed, the optometrist makes out a prescription therefor, the original of which is kept in the store while a carbon copy is sent to the Salt Lake City office. Simple lenses are manufactured in the local store; complicated ones, at Salt Lake City. The optometrist in charge is instructed to adhere to the defendant's price list. The majority of patients have their glasses manufactured by defendant. The price of glasses, which includes the hidden charge for the optometrist's work, being fixed by defendant, and the continuation of the optometrist's employment by defendant obviously depending on his success in selling eyeglasses, it can hardly be said that he is practicing his profession with that independence and freedom from extraneous influence which should characterize the work of a professional man We are of the opinion, the Supreme Court concluded, that the evidence indicates that the defendant corporation has unlawfully engaged in the practice of optometry. The judgment in favor of the defendant was therefore reversed and the case remanded with directions to enter a decree enjoining the defendant from continuing to so engage.—*State ex rel. Sisemore v. Standard Optical Co. of Oregon, 188 P. (2d) 309 (Ore., 1947).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted.

Visual Hallucinations. H. P. Wagener. -p. 226.

Rutin Therapy for Increased Capillary Fragility.- Levitt and associates studied the effects of rutin on the capillary fragility and retinopathy of diabetic patients to ascertain whether improvement in one was accompanied by changes in the other. Twelve patients with diabetic retinal hemorrhages and greatly increased capillary fragility were studied. Patients were saturated with ascorbic acid, 100 mg. three times a day for one month prior to treatment. They were then given rutin, 20 mg. three times a day, for two months; the dose was increased to 40 mg. three times a day for another month. Considerable improvement in the capillary fragility of the skin was found in 3 patients, and moderate improvement in 1. In 2 patients the changes accompanied a reduction of hypertension. Only five fundi (4 patients) of twenty-three improved; in two of the five, retinal hemorrhages cleared up completely. This improvement cannot be directly attributed to rutin. Diabetic retinitis progressed rapidly in 1 patient while under treatment. In 2 patients retinal lesions improved without a change in the increased capillary fragility of the skin, and in others capillary resistance of the skin increased without retinal improvement.

Vascular Approach to Rheumatoid Arthritis.— Boucek and Lowman point out that the literature contains many references to the abnormal vascular pattern of rheumatoid arthritis. On this basis patients with acute involvement of joints were treated by constant packing of both the involved joints and the surrounding soft tissue immediately on admission to the hospital, using hot moist foments. This is continued for seventy-two hours or more until acute edema and pain are alleviated. Packing is similar in technic to that described by Kenny. Following this the patient is subjected to the spinal flushing procedure of Speransky, which consists in doing first a lumbar puncture and then aspirating and reinjecting spinal fluid. After the headache from spinal pumping has disappeared, the patient begins a course of typhoid vaccine treatment and autohemotherapy. This consists usually of six fever sessions induced twice weekly for three weeks. At the same time that triple typhoid vaccine is given intravenously, 10 cc. of the patient's blood withdrawn from the arm is reinjected into the gluteal muscles. A violent chill with an elevation in temperature to 102 to 104 F. sustained for four to six hours is the effect desired. Between these fever treatments the patient is given nicotinic acid orally twice a day. Physical therapy is utilized as indicated. Twenty-seven patients were subjected to these measures. The majority of those with rheumatoid arthritis appeared to be benefited.

Effect of Antireticular Cytotoxic Serum on Fractures.—Since Soviet investigators had claimed that delayed union and nonunion were among the conditions favorably influenced by antireticular cytotoxic serum, Thompson and his co-workers studied effects of this serum on the healing of fractures. Alternate patients admitted with fractures of humerus, femur or tibia, were treated with antireticular cytotoxic serum or with normal goat or rabbit serum. Fifty-three patients were treated with antireticular cytotoxic serum and 40 with normal serum. A third group of 79 consecutive fractures taken from recent files served as untreated controls. The data indicate that fractures treated with antireticular cytotoxic serum manifest roentgenographic evidence of improved healing statistically significant as compared with the control series of patients. Clinical observations were in conformity with the roentgenographic evaluation. The number of patients with delayed union of fractures who were treated with antireticular cytotoxic serum was small and without controls, so that a definite conclusion could not be reached. Here, too, the trend was favorable. The authors will continue the study.

Schoenlein-Henoch Syndrome.-Davis reports 44 patients between the ages of 4 and 71 years with Schoenlein-Henoch syndrome. This syndrome is defined as a condition in which nontraumatic hemorrhage with or without edema may occur in the skin, subcutaneous tissue, joints, viscera or in any combination of them. The blood platelets are normally abundant. The condition was about three times as common in women as in men, but in children sexes were about equally affected. One third of the patients had only one attack, and a few had numerous attacks. Each attack lasted for a few weeks. Recurrences covered periods varying from a few months to fifty years. In most patients they ceased within five years of onset. No familial instances were encountered. Of the 44 patients, 38 showed spontaneous ecchymoses or petechiae or both. Most had purpura of the skin only during attacks, but a few had ecchymoses between attacks. Localized edema occurred on the backs of hands, around the eyes, face, neck, lips, legs, arms and penis. Joints particularly involved were those of fingers, wrists, knees, elbows and ankles. Gastrointestinal pain or hemorrhage was pronounced in 12 patients, and 3 patients had hematuria. Values for blood counts, platelet counts, bleeding and coagulation times, clot retraction and prothrombin time were normal, but occasionally polymorphonuclear leukocytosis was seen. The capillary resistance test was positive in only 11 patients. Treatment was essentially symptomatic. The causes of the syndrome are varied, but streptococcic infection is important, and anaphylactoid causes are infrequent. Prognosis is good. The 4 patients with renal involvement recovered. Schoenlein-Henoch purpura and purpura simplex overlap, but in contrast with the latter Schoenlein-Henoch purpura is not familial and is common in men and children.

Treatment of Nasal Hemorrhage.-Dickie shows that there is no one method of arresting nasal hemorrhage which is applicable in every case. In the milder cases local cauterization will suffice, while in severe cases more drastic action must be taken. Use of the rubber tampon is the author's favorite method and is successful in most instances. The postnasal pack, when properly applied, will usually arrest the bleeding provided that it is not coming from the ethmoid arteries. In fractures through the ethmoid with uncontrolled hemorrhage from the nose it would probably be better to obliterate the anterior ethmoid artery early. In fractures it is obviously undesirable to keep nasal packing in too long for fear of sepsis. In severe bleeding from the sphenopalatine, ligation of the external carotid is easy and safe and avoids much of the discomfort of packing.

Induced Resistance to Penicillin and Oxygen Utilization.--Since the mode of action of antibiotics may be determined by physiologic and metabolic studies, rather than by morphologic studies, Bellamy and Klimek decided to determine more completely the physiologic changes brought about by induced resistance to penicillin. They obtained a penicillin-resistant variant of Staphylococcus aureus, which grows more slowly than the sensitive parent culture. This resistant variant has lost the ability to grow anaerobically. Strains of Streptococcus faecalis, Streptococcus mastitidis and Clostridium welchii when treated in a similar manner failed to develop significant resistance to penicillin. These data suggest that organisms dependent on anaerobic processes for their growth will not develop appreciable resistance to penicillin.

Bacitracin.--Anker and his associates report progress on the new antibiotic bacitracin from the point of view of assay, mediums for production, harvesting, concentration, purification and chemical properties. A tentative unit has been defined. An *l*-glutamic acid synthetic medium and a soybean digest medium have been proposed from the point of view of simplicity and uniformity on the one hand and high yields on the other. The optimun time for harvesting was found to be after 72 hours of incubation at 37 C. The antibiotic can be extracted from the harvest by *n*-butanol and concentrated by steam distillation in vacuo. Pigmented impurities may be removed by magnesium oxide. The active principle may be precipitated without loss of potency by salicylic acid. Crude bacitracin is highly soluble, and such solutions are stable at zero to 5 C. for eight months to one year. It may be lyophilized, and in this dried state, in vacuum vials, it remains stable at room temperature.

Study of Poliomyelitis Virus Carriers.—Rubenstein and his co-workers describe an outbreak of infantile paralysis in a Boy Scout camp attended by boys between the ages of 12 and 18 years. Although the camp was divided into three groups, the occurrence of clinical cases was confined to only one of the groups and the studies on the carrier rate were similarly confined to this group. Of the 31 members, in 5 there developed frank poliomyelitis, with 4 bulbar cases, 1 of which terminated fatally. Of the 18 healthy members studied in this group, 5 were revealed to be intestinal carriers of the virus, and 1 of these also harbored the virus in his throat. Estimates of the total infection rate in this group were roughly 43 per cent, with a ratio of cases to carriers of about 1:2. Of the 5 carriers, 3 excreted the virus in the stools for at least three or four weeks. In the single carrier in whom the virus was isolated from both the oropharynx and the intestinal tract, virus was isolated from the stools for a period of about one month; it could not be found in the throat after the first week. In 1 of the clinical cases, virus was isolated from both the oropharynx and the stools one day before the onset of symptoms. Of the 5 carriers who returned to their homes, only 2 had siblings there, who were exposed to the carriers (1 of whom had virus in both the throat and stools), but neither subsequently became carriers of the virus. The strain of poliomyelitis virus isolated during the outbreak did not appear to the related to the Lansing and Y-SK strains by serologic tests, nor could it be adapted to rodents even after many trials.

Strong Solution of Iodine Mixed with Dextrose for Goiter.—Estrada and Nery point out that although the use of thiouracil has eliminated thyroid crises, it has its drawbacks and has created new problems. Aside from the possibility of producing agranulocytosis, its use requires a long preoperative treatment and it produces a highly vascular and friable organ that makes hemostasis difficult and uncertain. The authors decided to go back to iodine, but to administer it in a modified form. They administer 2 cc. strong solution of iodine (Lugol's solution) in 1,000 cc. of isotonic or hypertonic dextrose solution in the form of continuous venoclysis. They have used this medication in 25 patients, most of whom had diffuse toxic goiter or primary hyperparathyroidism. In 17 cases it was used postoperatively and in the other 8 cases it was used both before and after operation. The results were most encouraging in that thyroid crises either were prevented or occurred without nervous manifestations and without fatality.

Teratogenic Effects of Influenza and Mumps Viruses on Chick Embryos.—The discovery that the rubella virus passes through the placenta and causes a specific pattern of localized malformations in the human embryo induced Hamburger and Habel to analyze the effects of viruses as teratogenetic agents under the controllable conditions of animal experiments. The chick embryo suggested itself as a suitable embryonic material, since it is known that the tissues and the extraembryonic membranes of the chick embryo are a favorable medium for culture of a number of viruses. They found that influenza A (PR 8) has teratogenetic effects on the early chick embryo. It produces a specific syndrome, comprising microcephalia and micrencephalia, twist of the axis and impairment of the growth of the amnion. Furthermore, the virus is lethal for early embryos within three days after infection. The mumps virus is likewise lethal for early embryos within five days after infection. It does not produce specific abnormalities but seems to raise the incidence of malformations of the types which occur occasionally in uninfected chick embryos. These results place influenza A virus in line with rubella virus as a teratogenetic agent. Furthermore, the observations on infections due to influenza A in chick embryos confirm those on rubella in human beings in that only infections of early embryos result in abnormalities.

Giant Follicular Lymphadenopathy.--Uhlmann says that the condition known as giant follicular lymphadenopathy and associated with the names of Brill and Symmers bears a strong resemblance to Hodgkin's disease and in most instances is diagnosed as such. Giant follicular lymphadenopathy is characterized by either localized or generalized enlargement of the superficial lymph nodes, often in conjunction with splenomegaly. The first enlargement seems frequently to be in the lymph nodes of the neck, but swelling of the lymph nodes may occur also in the supraclavicular fossa, the axilla, the groin or the abdomen, or may be generalized. The involved nodes are usually soft; seldom do they become hard. Their size varies. The general condition of the patient is usually not greatly influenced. Microscopic examination of the lymph nodes reveals that the structure is changed but not completely destroyed, and the pathologist usually designates the process as chronic lymphadenitis or lymphoid hyperplasia. Often the follicles are filled with large hypochromatic or even achromatic nuclei, also called "shadow cells." In some instances the peripheral zone of small lymphocytes is absent, while in others the follicles may be made up exclusively of small lymphocytes. The author reports 22 cases of giant follicular lymphadenopathy that were observed at the Tumor Clinic of Michael Reese Hospital in Chicago since 1941. While small amounts of radiation are sufficient in most instances to produce the disappearance of involved lymph nodes, this does not constitute cure of the disease. Large amounts of radiation, such as are commonly used in the treatment of malignant lesions, suppress the symptoms for many years. The author believes that giant follicular lymphadenopathy should be treated from the beginning as potentially malignant with intensive doses which may control the symptoms and prevent the development of Hodgkin's disease, leukemia and sarcoma.

Solar Retinitis.—Reviewing literature on solar retinitis, Rosen says that most authors stress the edema, clouding and pigmentation which occur in the macula with little emphasis on the final *macular picture. Some observers have mentioned* macular holes. In the past year, the author observed such easily overlooked small macular holes in quite a number of patients during routine eye examination. Although he was careful not to ask leading questions, he obtained a history of "sun-gazing" or a related act in all the patients. The histories of 23 of these patients are given, and a table lists many of the methods and some of the protective procedures followed by these patients. The author cites a report by Smith on military personnel stationed in a tropical country. These case reports seem to bridge the gap between the many descriptions of the acute edema following eclipse blindness and the ultimate small macular holes found many years later. The condition is far from rare and the problem is largely one of prevention of "sun-gazing."

Cancer of Stomach in Addison's Anemia.—Bourne points out that among some clinicians there is a feeling that patients with pernicious anemia are more liable to gastric carcinoma than normal persons of the same age group. During the past two years the author has studied 15 of his patients with pernicious anemia by means of roentgenography and gastroscopy in the hope of detecting carcinoma of the stomach at an early stage. He detected this disease in 3 patients, whose case histories are given. In these cases the carcinomatous area was in the lower third of the stomach, where radiology demonstrated narrowing even in the 2 cases which were at an early stage. The lower part of the stomach is not usually abnormal in pernicious anemia. An abnormal antral mucosa, especially when associated with a narrow antral canal, may predispose to cancer. It is recognized that in the prepyloric area cancer is particularly liable to develop. Patients with pernicious anemia who exhibit an abnormal mucosa there should be viewed with as much suspicion as hyperchlorhydric patients with prepyloric ulcers. There is reason to believe, also, that simple neoplasms of the stomach are unduly frequent in pernicious anemia. Carcinoma may appear in any gastric area. The author concludes that periodic roentgenologic and gastroscopic studies are strongly indicated in all cases of Addison's anemia in remission or relapse.

Dialysis of Blood with Artificial Kidney.—Alwall and his collaborators point out that several workers have tried to construct an apparatus for the dialysis of a patient's blood outside of the body. They describe and stress the advantages of Alwall's dialyzer, or artificial kidney. After successful preliminary tests with a solution of urea, followed by dialysis of blood in tests on animals, the dialyzer was used to treat 8 patients with uremia. The histories of 5 of these patients are given. A table shows the amount of nonprotein nitrogen eliminated in each patient by dialysis with the artificial kidney. The case reports indicate that there was improvement, but in some patients it was only temporary and they died later.

Sensitization of Penicillin-Resistant Bacteria.—Voureka reports experiments which show that some strains of penicillin-resistant staphylococci and streptococci can readily be made sensitive by growing them in mixed culture with other organisms, whether or not they are sensitive to penicillin. The same change can be induced if the bacterial association occurs in the refrigerator, where growth does not take place. Some bacterial autolysates can also effect this change. The acquired sensitivity lasts a long time. It has been assumed that naturally resistant strains retain their resistance permanently in the body; but from the experiments which are cited it seems clear that when some of such strains grow in association with other bacteria—a condition which often happens in the body—they may lose their resistance.

•Recurrent Agranulocytosis: Report of Case. G. M. G. Barton.—p. 103.

Phalangeal Metastases in Bronochogenic Carcinoma.—Colson and Willcox say that carcinoma of the bronchus is notorious for the frequency and diversity of its metastases,which Ask-Upmark attributed to the easy access of the growth to the pulmonary veins and thence to the systemic arteries. This paper concerns metastases in the terminal phalanges in fingers and toes. Of the 3 cases reported, the first concerned a woman aged 65 who had a primary carcinoma of the bronchus and widespread metastases, which included deposits in three of the terminal phalanges of the fingers. The second was a tabetic man in whom the first signs of malignant disease were the appearance of metastases in a phalanx and a metatarsal. The third was in a man with signs suggesting a bronchial carcinoma and a metastasis in the left great toe. All 3 phalangeal metastases closely resembled clinically an inflammation; they were initially assumed to be due to a paronychia or whitlow in cases 1 and 2 and an infected bunion in case 3. The radiologic changes were essentially similar in all cases, and aspiration biopsy proved helpful in the diagnosis.

Vitamin E in *Angina* Pectoris.—Makinson and his co-workers say that it has been suggested (Vogelsang and Shute, 1946) that vitamin E relieves the pain and improves the exercise tolerance of patients with angina pectoris. However, the published work on this subject is not critical, nor are the observations adequately controlled. The authors therefore decided on a clinical trial. Twenty-two patients with typical angina of effort were treated with vitamin E, phenobarbital, aminophylline and calcium lactate, each drug being given for three weeks, after which the patients were asked to compare the effects of the drugs. From this small but clinically significant series it is concluded that *vitamin* E *is not of* any therapeutic value in the routine treatment of angina pectoris.

Recurrent Agranulocytosis.—Barton reports the case of a man, aged 79, who had six attacks of agranulocytosis over a period of eighteen months. The attacks were accompanied by ulceration of the throat. The man had lived on a restricted diet and had taken acetylsalicylic acid and "allonal," which contains pyramidone. He used benzene in his work.

Chemotherapy and Pharmacology of Aerosporin.—Brownlee and Bushby report aerosporin as an antibiotic produced by an aerobic spore-bearing bacillus identified as Bacillus aerosporus, which is probably identical with Bacillus polymyxa. This report is mainly concerned with the effectiveness of aerosporin in experimental infections with gram-negative bacteria. Aerosporin is more discriminating in its action than is streptomycin. It has no action on the tubercle bacillus, but against those gram-negative pathogens against which it is active it is from ten to several hundred times more active than streptomycin. In experimental infections in animals aerosporin gave complete protection against Hemophilus pertussis with elimination of the infection, whereas streptomycin did not protect. Similar effects were demonstrated in experimental *infections* with *Salmonella typhosa, Hemophilus* bronchisepticus and Escherichia coli. Aerosporin is not absorbed from the intestine. Given parenterally it disappears from the blood stream quickly; hence maintenance doses at four hour intervals are necessary. Aerosporin is bactericidal. Resistant strains are produced with difficulty The blood aerosporin level corresponding to the minimal lethal intravenous dose (L.D.50) is at least seventy five times greater than the average therapeutic blood level. Aerosporin is nonhemolytic and has about the same toxicity to leukocytes as penicillin. Concentrates of aerosporin are more or less contaminated with an antidiuretic principle and a substance which damages renal tubules. Purified material is free from the second factor, and the first has not been shown to act in man. In an addendum the authors point out that the report by Stansly and others on polymyxin reached Britain after their report on aerosporin had been prepared for publication. Polymyxin is produced by the organism which produces aerosporin and appears to have an identical antibacterial spectrum but only a fraction of the intrinsic efficiency of aerosporin. Whether polymyxin is impure aerosporin or is a different molecule remains to be discovered.

Aerosporin in Pertussis.—Swift treated an unselected series of 10 children with pertussis, aged 1 month to 2½ years, with aerosporin. Dosage was 0.4 mg. intramuscularly every four hours for mild infections and 0.8 mg. at four hour or three hour intervals for severe infections continuously for five days. All children manifested a response in the first forty-eight hours; the measure of ultimate benefit seemed to depend on the duration of symptoms before the start of treatment rather than on the severity of the disease or the patient's age. Early cases of pertussis, treated before secondary infection has taken place, may respond to aerosporin alone; whereas in late cases a combination of aerosporin and a sulfonamide drug may be more effective. The mild toxic effects were associated with the presence of impurities in the aerosporin.

High Protein Diet in Glomerulonephritis.—Mortensen presents observations on 44 patients with acute glomerulonephritis, chiefly of scarlatinal origin. The patients were classified in two groups of 22 patients each, one receiving a low, the other a high protein diet. The two diets were largely identical, except that the 250 Gm. of oatmeal porridge with sugar in the low protein diet was replaced by 250 Gm. of lean meat in the high protein diet. The prognosis is generally taken to be better in scarlatinal nephritis than in other forms of acute nephritis. In this group all patients except 1 of those on the low protein diet recovered. The duration of the nephritis was the same in the two groups. The albuminuria appeared to have subsided more rapidly in the group of patients given the high protein diet. Besides being more agreeable, the high protein diet also improved the general condition of patients.

Chronic Polyarthritis (Still's Disease) in Infancy. A. Tho.—p. 407.
*Chemotherapy of Infantile Diarrheas. J. Švejcar.—p. 417.

Congenital Malaria.—Eckstein reports 4 cases of congenital malaria in infants who were born in Ankara during the cool, relatively cold, season in the course of which fresh malaria cases have never been observed previously. The first attacks of malaria in these infants were observed on the sixth, twentieth, twenty-ninth and thirty-fourth day of life, but the history of the cases makes it likely that the first symptoms were manifested already on the sixth, sixteenth, third and second day of life, respectively, when the cases were not yet diagnosed. All the infants were born in a hospital. Two were brought immediately to an infant home, while the two others were brought to the private homes of well-to-do parents. A postnatal infection can be definitely excluded; thus 14 cases of congenital malaria reported previously by the author are increased to 18. In addition to the occurrence of malaria in infants, inmates of an infants' home in Ankara are described. Taking into account their date of birth, the first appearance of signs of malaria (observation of parasites in the blood along with the other manifestations characteristic of this age) and the regional climatic conditions, one cannot but assume that infantile malaria was congenital in at least 10 instances. The infants were transferred to the home as a rule immediately after birth or during their first months of life, and were under regular medical control. The climate of Ankara prevents the appearance of anopheles and thus the spread of malaria during the months of January/May and October/December. Only those infants were considered as suffering from congenital malaria who were born during the months mentioned and had their first attack during the same period. In these infants the earliest manifestations of malaria occurred on the third, fourth, tenth, thirteenth and sixteenth day after birth. It is emphasized that there is no "definitely fixed incubation period" for malaria and that the first attack may be delayed. This proves correct likewise for congenital malaria according to the degree of mild to massive intrauterine infection. In order to be able to assess the first clinical symptoms, special knowledge of the peculiarities of malaria in infants is required.

Chemotherapy of Infantile Diarrhea.—At the first Children's Clinic in Prague, Czechoslovakia, Svejcar treated 217 infants up to 1 year of age who had diarrhea with succinylsulfathiazole or with sulfaguanidine. Twenty-six of these infants were premature and 26 newborn up to 4 weeks of age. Of infants above this age 55 had diarrhea of enteral origin, 25 with toxic symptoms; 97 had diarrhea of parenteral origin, 37 with toxic symptoms and 5 with recurrences; the remaining infants had infectious colitis. Thirteen of the treated infants died, so that the mortality rate of the whole series was 5.9 per cent: two were newborn infants, 4 were premature infants, 1 had toxic diarrhea of enteral origin and 6 had toxic diarrhea of parenteral origin. Succinylsulfathiazole and sulfaguanidine were given in doses of 2.5 Gm., half a tablet (0.25 Gm.) ten times daily, on the first day of treatment. Half this dose was usually given for a period of five days regardless of the age of the infants. In addition daily doses of 40,000 units of penicillin divided into eight intramuscular injections were given to newborn and premature infants. To full term infants penicillin was given only in cases of severe parenteral infections or in cases with severe toxic symptoms in which parenteral infection was likely. Stools improved rapidly and rehydration was also rapid, so that intravenous infusions were required infrequently; in those cases in which they had to be employed their effect was lasting. Dietetic treatment is of minor importance; it is limited to a short rehydration diet followed by quick realimentation with buttermilk. Thereby the danger of previously prescribed prolonged starvation diets is avoided. It is concluded that the combined use of sulfonamide drugs and penicillin has more influence on the course not only of the diarrhea but of the parenteral disease than penicillin alone. Most important in the prophylaxis of diarrheal disease are the prevention of contamination of foods by the use of dried sterile milk and the protection of infants from parenteral infections.

Chronic Constipation Usually a Wrong Diagnosis. H. Ohnell. —p. 383.

Citrin in Treatment of Ulcerative Colitis.—Mařatka investigated the efficacy of citrin (vitamin P) in the treatment of 33 cases of ulcerative colitis. He found that there is a great difference between the mild (hemorrhagic) and the severe (suppurative and ulcerative) forms. Treatment with citrin was found effective in the initial, hemorrhagic stage of the disease, but it was ineffective in the severe forms.

Bioptic Picture of Epidemic Hepatitis.—Kalk and Büchner performed six hundred punctures of the liver under direct vision by means of the laparoscope in patients with epidemic hepatitis. In the early stages of the disease a red discoloration of the liver was revealed on macroscopic examination. The rigidity of the entire organ depended only on the tense filling of the liver within its capsule; after pushing through the capsule the parenchymal tissue was soft and friable. With the icterus at its height the gallbladder was empty and remained so up to the forty-fifth day after the first appearance of the icterus. In addition the gallbladder had lost its tonus and was flaccid or wrinkled. The spleen was enlarged considerably. In the later stages of the disease the liver was dark brown and the gallbladder was filled tensely; it was grayish green and there was pronounced hyperemia of the serous membrane. The administration of choleretics and cholekinetics as well as duodenal irrigation with oil and magnesium sulfate was suggested to prevent stagnation of the contents of the gallbladder. Changes in the periportal fields were predominant in the microscopic picture of early cases. Disseminated single cell necroses may appear first on the periphery of the hepatic lobules and later on in their central areas. Homogeneous ramified effusions in the biliary capillaries were observed during the first days. Swelling, mitotic increase, molting and rounding of the capillary endothelium occurred in the hepatic lobules during the second week of the disease. Hepatic lobules were interspersed with small groups of cells loaded with disintegration pigments. Amitotic epithelial cell segmentation occurred during the third week, beginning to rebuild the destroyed epithelium of the liver, which restoration may be completed by the budding of the small biliary ducts. In mild cases the hepatic lobules may be restored completely in several weeks; additional weeks may be required for the periportal changes to subside. The term late nodules is suggested for the nodular conglomerations of proliferated endothelia which may still be present in the lobules. Collagen fibrils may develop between the hepatic epithelia in rare cases. A serous inflammation does not play any part in the course of epidemic hepatitis, and that applies to the early as well as to the late stages of the disease. The frequent proliferation of the endothelium is to be considered as a second, independent effect of the causative agent in the lobules rather than as a mere sequela of the necrosis of the epithelium. Late nodules occur even after a complete clinical recovery. This may explain the tendency to late recurrences. There is nothing to suggest a possible developement of cirrhosis of the liver, but there were infrequent cases of recovery after acute atrophy of the liver

New Colloid Reaction.—Neumann tested the serum of 92 patients with various diseases of the liver (30 with catarrhal jaundice and epidemic hepatitis; 16 with atrophic cirrhosis; 24 with cardiac cirrhosis, and 22 with acute atrophy of the liver, metastasis of the liver, acute occlusion of biliary ducts or acute cholangitis) by means of a modified Riebeling hydrochloric acid-"collargol" reaction. The principle of this reaction consists in a protective effect of the albuminous bodies of the serum against precipitation by the hydrochloric acid. The pathologic hydrochloric acid-"collargol" (colloidal silver preparation) reaction differs from the common colloid reaction by a two phase course which is characterized by a first and second protective zone. The serum of patients with parenchymatous lesions gave a decisively positive reaction. The reaction was still positive after clinical symptoms had subsided. This suggests the possibility of the evaluation of latent damage in addition to the diagnostic value of the reaction. One case of postarsphenamine jaundice in a man aged 36 is reported, in which all symptoms disappeared within seven weeks although the hydrochloric acid-"collargol" reaction remained positive. Arsphenamine therapy was continued, resulting in a second attack of jaundice after the second injection. Further accidents did not result from arsphenamine therapy after the hydrochloric acid-"collargol" reaction had become negative. The hydrochloric acid-"collargol" reaction proved to be superior to the Takata-Ara and to the Weltmann reaction.

Comparative Study on Children of Cities and of Rural Districts with Regard to the Effect of Deficient Nutrition. W. Auerswald and H. Bornschein.—p. 854.
Development and Present State of Medical Research in Great Britain. N. Howard-Jones. —p. 857.
•Treatment of Poliomyelitis with Fresh Convalescent Serum. H. Czickeli and R. Brauner. —p. 859.
Potato Treatment in Cardiac Dropsy. G. Seiller.—p. 864.

Fresh Convalescent Serum in Poliomyelitis.—Czickeli and Brauner report an outbreak of poliomyelitis attacking 152 persons, 72 male and 80 female, in Knittelfeld, a small town in Styria, Austria, in 1947. Thirty-eight patients were children less than 14 years of age and 114 were over 14, the oldest being 75. Twenty-three presented paralysis; 18 manifested intestinal symptoms; 2 had polioencephalitic symptoms, and 109 had a meningitic type of the disease. A familial disposition was suggested by the occurrence of the disease in 16 members of a family of 23 persons. Lumbar puncture proved to be the only reliable method of diagnosis. In 6 cases dissociation was observed between the number of cells and albumin. Müller's triad, consisting of hyperesthesia, sweating and leukopenia, is of no practical importance. Stiff neck of various degree could be demonstrated in the majority of the meningeal cases. In addition there was hyperreflexia in more than one third of the cases. Two hundred to 400 cc. of blood was taken from older children and adults at the end of the third or at the beginning of the fourth week of the disease. Blood was refrigerated twenty-four to thirty-six hours for coagulation; it was then centrifuged and a 0.5 per cent carbolic acid-serum solution was prepared. This convalescent serum was administered to 70 patients; there were no untoward reactions. The serum was heated up to 56 C. (132.8 F.), and this inactivated serum was administered to 47 additional patients. Of the 117 patients to whom the serum was administered, 1 died from Landry's paralysis and 2 manifested paresis. The serum was not administered to 35 patients; 17 of them already were paralyzed on admission; of the remaining 18 patients, 1 had paralysis and died and 2 had paresis. Further trials with convalescent serum are suggested.

Book Notices

Histopathologic Technic. By R.D. Lillie, A.B., M.D., Medical Director, U.S. Public Health Service, Washington, D.C. Cloth. Price, $4.75. Pp. 300, with 1 illustration. The Blakiston Co., 1012 Walnut St., Philadelphia 5, 1948.

Manuals of histologic technic often resemble old pharmacopeias or cook books in that they are compendiums of huge numbers of empiric recipes often differing by only minute quantities of one or several ingredients. The vast majority of the recipes are rarely tried, and many formulas have been retained out of inertia, piety or ignorance of the role of the ingredients. The present manual represents a partial break with this tradition. It is an attempt to remove some of the uncertain elements of the art of staining and to make of it a more exact craft by the use of buffered solutions and accurately delineated dyes. Some improvement is also attained in this manual by tabular arrangement of variant procedures which clarifies the differences. The table on page 22 for the conversion of prices of solvents in avoirdupois units to current prices per liter seems superfluous.

The book should be useful to technicians and beginners in the preparation of histologic material. The initial section on microscopy consists of somewhat sketchy comments on selected aspects of the microscope. It is difficult to see the scientific basis of the recommendation that in the selection of a microscope "manufacturer's plant be in the same country as the user." Details on the selection of objectives and use of Abbe test plate, choice of oculars and substage are given. A method for centering the condenser is given but no instructions for precision illumination. The experience of the author and his colleagues is extensively reported with several valuable comments. Some statements seem inadequately supported or of doubtful generality such as that albumin fixative functions as a surface tension depressant rather than an adhesive (page 48) and "Glycogen was not preserved in one series of tests in which acetone was tried as the fixing agent" (page 30).

In the chapter on stains and staining (page 54) no mention is made of Schultz's Farbstofftabellen. The uninitiated might profit by some explanation of the chemistry of the periodic acid method and other histochemical tests. Only one reference is given to the literature on the technic of autoradiography. Tables of selected buffers are given. It is not apparent why $NaH_2PO_4H_2O$ was substituted for the more usual KH_2PO_4 of the Sorensen mixtures.

Recent Advances in Medicine: Clinical Laboratory Therapeutic. By G. E. Beaumont, M.A., M.D., F.R.C.P., Physician to the Middlesex Hospital, London, and E. C. Dodds, M.V.O., D.Sc., Ph.D., M.D., Courtauld Professor of Biochemistry in the University of London, London. Twelfth edition. Fabrikoid. Price, $6. Pp. 422, with 42 illustrations. The Blakiston Co., 1012 Walnut St., Philadelphia 5, 1947.

Since 1924 volumes have appeared at frequent intervals to summarize progress in medical science. This book differs from the yearbooks in that it has collective reviews supplemented by adequate bibliographies rather than collected abstracts. It reflects excellently the progress in medical science since the last previous edition in 1943; however, the literature reviewed does not extend much beyond 1945, although there are occasional references to articles published in 1946. Among the most useful of the chapters is that related to infective hepatitis and other forms of jaundice.

Cardiopatias congenitas de la infancia. Por el Dr. Agustin Castellanos y Gonzalez, profesor agregado de la Catedra de patologia y clinica infantil de la Universidad de La Habana. Con la colaboracion del Dr. L.A. Cabrera. Fabrikoid. Price, $9. Pp. 406, with 83 illustrations. Manuel V. Fresneda, Neptuno' 561, La Habana, 1948.

The recent growing interest in congenital heart disease makes this book by Castellanos welcome indeed, particularly since his pioneer work in angiocardiography has played an important role in the development of the newer technic so useful in the study and diagnosis of congenital anomalies. Every cardiologist would do well to read this book, which represents the mature thinking of a major contributor to the field. The book is divided into three parts and is adequately illustrated. The first part deals with the embryology of the heart, the fetal circulation, the changes that occur in the circulation following birth, the peculiarities of the cardiovascular apparatus of the child and a survey of the various methods for examining the heart of the child. As expected there is a rather thorough development of the roentgen technic. The second part deals with the syndromes encountered in congenital heart disease. The third part is a systematic description of the various types of cardiac anomalies. The style is simple, and the author includes much of his own work and shows a thorough familiarity with the literature. This monograph is highly recommended.

Die Klinik der energetisch-dynamischen Herzinsuffizienz. Von Dr. Robert Hegglin, Privatdozent an der Universität Zürich, Zürich. Sonderausgabe von Fasc. II der Bibliotheca cardiologica. Paper. Price, 19 Swiss francs. Pp. 120, with 82 illustrations. S. Karger, Holbeinstrasse 22, Basel, 1947.

The rather fanciful term metabolic-dynamic heart failure is used to describe a lengthening of electrical systole and a concomitant shortening of mechanical systole (except in asphyxia, in which both are shortened, but the mechanical systole much more than the electrical). The occurrence of this phenomenon is described in a variety of clinical conditions; viz., diabetic coma, insulin shock, hepatic coma, dehydration, hypochloremia, addisonian crisis, porphyria, severe infections, barbiturate poisoning and hyperthyroidism. The premature occurrence of the second heart sound is ascribed to primary myocardial weakness, the result of a metabolic disturbance. Clinically the condition is is characterized by a premature second heart sound, the absence of venous congestion, a change in heart size, a small pulse, a lowered blood pressure and a tendency to fainting. The changes in electrical and mechanical systole are used to differentiate this state from peripheral vascular collapse. Usually the changes in systole are reversible providing the underlying metabolic disturbances are corrected. The author discusses management of such cases, in part on a speculative basis. Some of the author's statements may appear provocative; his method of determining the duration of mechanical systole may be questioned; nevertheless an interesting problem for the cardiologist is presented.

Peace by Thinking. By Elmer E. Ledbetter. Fabrikoid. Price $3.50. Pp. 486. S.J. Bloch Publishing Co., 600 Woodward at Congress, Detroit 26, 1947.

The author of this book received his early training as a lawyer, then served successfully as a business executive in various industries. Throughout that period he carried on the private study of philosophy and the social sciences. At the age of 66, still active in business as founder and head of his own oil company, he now publishes this thought-provoking philosophic volume.

So wide is the range of thinking shown here that it is difficult to attempt to assess its accuracy and validity. The first premise is that "man's mentality is big enough and good enough, but he is not using it correctly." To use our mentality correctly we must understand *(a)* that we have an "intuitive mind which is objectively blind" and *(b)* that it is necessary for them to function together. Thinking only with the objective mind may make mere survival possible for a time, but thinking with the intuitive mind is also necessary if successful living is to be attained. Successful living is defined "as the kind of job done by that unbroken evolutionary strain which rose from the single celled protozoa to the estate of man." Unsuccessful living "is the kind of job done by any of the hordes of extinct species, such as the Megatherium, Mastadon, Dinosaur or Dodo." This, then, is the author's "cosmic law of mentality."

The fact that present society is hovering on the brink of catastrophic disaster as the result of the atomic bomb, bacterial warfare and other weapons of modern war is evidence that we have failed to combine intuitive thinking with our objective thinking. Such thinking, which breaks the "cosmic law of mentality," eventuates in conduct which in turn breaks the "cosmic law of conduct" (which the author explains in three related propositions) and can result only in "unsuccessful living."

A Textbook of Bacteriology. By *Thurman B. Rice*, A.M., M.D., Professor of Bacteriology and Public Health, the Indiana University School of Medicine, Indianapolis, Ind. Fourth edition. Cloth. Price, $6.50. Pp. 603, with 127 illustrations. W. B. Saunders Co., W. Washington Sq., Philadelphia 5, 1947.

This text was written to serve as a practical rather than a theoretic textbook. The subject material is covered in an elementary and superficial way. Many of the chapters are out of date, as for example, chapter 23, entitled "The Paratyphoid Group." Approximately a page in fine print at the end of appendix A is devoted to the subject of bacterial warfare. This textbook contains many points of practical interest which should appeal to the student at the subprofessional level. The lack of reference material is a serious omission from the professional point of view.

Public Health Measures in the Control of Diabetes: A Study of Practical Approaches Through Health Education. By Mary Rowe Moore, M.Ed. A Thesis Submitted to the Graduate Faculty of the Teachers College of The University of Cincinnati in Partial Fulfilment of the Requirements for the Degree of Master of Education. Paper. Pp. 44. Cincinnati. 1947.

This is a paper-bound monograph submitted by the author in partial fulfilment of the requirements for the degree of master of education. It is an extensively documented presentation containing a study of diabetes from the statistical and etiologic points of view. The purpose and procedure of the study of diabetes are outlined in connection with a review of the related literature. Procedure in the study was first to review available literature and second to study the history and functions of the Cincinnati Council on Diabetes. The history and nature of diabetes are studied, including the various eras of diabetes and the history of the disease since the advance of insulin. There are recommendations and suggestions for further study. Among proposals which look toward the better control of diabetes are better definition and history of the disease and stress on the positive aspects of practical methods of control and adjustment, teaching aids and a simple vocabulary to explain technical terms. More planned programs for lay associations interested in diabetes include regular scheduled meetings, open forums, employment opportunities and a diabetic newspaper or magazine for diabetic persons. Stress is laid on camp life for young diabetic patients and on the need for a film of occupational studies. Better contacts with the practicing physicians are advocated, and so is a survey of chronic illness in the community. This is a good piece of work effectively reported. Its greatest contribution is to health educators, who observe the rise of mortality due to diabetes and who would like to start doing something about it.

Health Instruction Yearbook 1947. Compiled by Oliver E. Byrd, Ed.D., M.D., F.A.P.H.A., Professor of Health Education, and Director, Department of Hygiene, School of Education, Stanford University, Stanford University, Calif. Foreword by Clair E. Turner, D.Sc., Dr. P.H. Cloth, Price, $3. Pp. 325. Stanford University Press, Stanford University, Calif.; Oxford University Press, Amen House, Warwick Sq., London, E. C. 4, 1947.

This book, reviewed in three previous issues of THE JOURNAL, is a compilation of selected brief material from the literature in public health. It is not a 1947 yearbook because it was published before the end of 1947, the preface being dated Aug. 1, 1947.

Tratamiento dd las leucemias con alkilaminas. Por Oscar Urteaga B., jefe del Departamento de patologia de la Facultad de medicina en el Hospital "2 de Mayo," Lima, Peru. Tesis para optar el grado de doctor en medicina. Paper. Pp. 163, with 120 illustrations. Editora medica peruana S.A., Azangaro 906, Lima, Peru, 1947.

This clinical monograph reports the experiences of the author in the use of nitrogen mustard therapy. Thirteen cases of various leukemias and a seminoma are presented. In 7 cases correlation is developed between the clinical, hematologic and pathologic changes following the use of this drug. The methods of therapy and the toxic manifestations observed are in accord with earlier reports on this subject. Clinical improvements reported are a reduction in the splenomegaly, hepatomegaly, adenopathy and a general well-being of the patients.

The author describes the hematologic changes in leukemia which developed during therapy as (1) a process of maturation of the leukocytes which is followed by a quantitative reduction, (2) a period of leukopenia followed by spontaneous rise to normal value, (3) a development of normal hemogram and myelogram and (4) complete regeneration of the hemopoietic system. The author believes that the methyl bis beta-chloroethylamine hydrochloride has a selective action on the myeloid and lymphatic cells and was not toxic to the erythroblastic series. This observation is not in keeping with reports by workers in the United States.

The author distinguishes in acute leukemia a sensitive type and a resistant type. In the latter there is a tendency toward the development of large cells with atypical nuclear patterns following therapy. The development of these cellular deformities has been described previously, but a correlation to clinical results is a new interpretation.

Autopsy material showed degenerative changes in the bronchial tract, gastrointestinal tract, liver, kidneys, epididymides, testes and hypophysis with necrosis of leukemic infiltrations.

The anemia in acute leukemia, prior to treatment, is hemolytic according to the author, as evidenced by erythrophagocytosis and reticulosinusoidal hyperplasia in the lymph nodes—suggestive of splenic tissue.

The clinical results in the cases of chronic leukemia indicate that the material will produce significant remission in the disease; however, the number of cases and the period of observation were too limited to attempt a conclusive statement. In acute leukemia no significant remission was produced with this drug. The monograph contains an extensive series of photomicrographs; however, it is unfortunate that the reproduction of these is not of sufficient technical quality to permit the reader to make interpretations. The general presentation and the organization are excellent

Pictorial Handbook of Fracture Treatment By Edward L. Compere, M.D., F.A.C.S., Associate Professor of Surgery, Northwestern University Medical School, Chicago, and Sam W. Banks, M.D., F.A.C.S., Associate in Surgery, Northwestern University Medical School Revised with the assistance of Clinton L. Compere, M.D., F.A.C.S., Associate in Surgery, Northwestern University Medical School Second edition Cloth Price, $5.50. Pp. 390 with 191 illustrations by Harold Laufman, M.D., F.A.C.S. The Year Book Publishers, Inc. 304 S Dearborn St Chicago 4, 1947.

The purpose of this book is clearly stated in the preface; it is designed to acquaint the general practitioner with the basic principles involved in the treatment of fractures. The opening chapters of the book elaborate on these general principles and the following chapters apply them to the fractures of specific bones. The treatment of various types of fractures of each bone is described: the authors have included reconstructive surgery for sequelae and unsatisfactory results from malunion or nonunion. They advise that the fractures requiring more complicated procedures be referred to a qualified orthopedic surgeon, but they do outline a brief description of each procedure so that the general practitioner can judge what may be necessary. In each case the treatment advised and described is the one found most satisfactory by the authors.

In this second edition some illustrations have been deleted and replaced with new ones and the total number has been increased by nineteen. Several chapters of the book have been completely rewritten, while the entire book has been reedited. The purpose of the authors has been achieved in presenting pictorially and concisely means of treatment for individual types of fractures which can be handled by the general practitioner.

Diabetic Guide. By Edwin B. Winnett, M.D., and A. G. Lueck, M.D. Loose-leaf. Leather. Price, $1.75. Pp. 114, with illustrations. American Lithographing and Printing Co., Des Moines, 1947.

The "Diabetic Guide" is for the physician rather than for the patient. A physician treating a patient familiar with this book would have difficulty, for the authors state too frequently what must and should be done. A physician may have difficulty in convincing a patient that he rather than the book is correct. The volume is handy in size and convenient to handle, but since so many diabetic persons have difficulty of vision, larger print would have been a great improvement. Such dogmatic assertions as "the best insurance against development of retinitis is good control of the diabetes" are confusing, for the foremost medical practitioners today feel that the association of retinitis and diabetes is far from confirmed. "Experience has demonstrated that mixtures ranging from 1.2 (1 unit of PZI [protamine zinc insulin] to 2 units of quick insulin) on up to 1.3 are the most satisfactory although ratios as low as 1:1 have been used with success." From this the layman would gather that the use of insulin mixture is fairly common and approved, but today the use of mixtures is still in the experimental stage and has been discarded by many men. There are many statements made in the book as facts that are still controversial among physicians and should be kept from the layman. "Globin insulin has been tried extensively in recent years; in general, it is less satisfactory than crystallive insulin, PZI (protamine zinc insulin) or a combination or a mixture of the two," is one of them. Only facts known and proved through the years should be told the man on the street, otherwise he is going to cause his physician trouble.

Nursing. By Lulu K. Wolf, R.N., B.S., M.P.H., Professor of Nursing, Vanderbilt University School of Nursing, Nashville, Tenn. Cloth. Price, $3.50 Pp. 534, with 203 illustrations. D. Appleton-Century Co., 35 W. 32d St., New York 1; 34 Bedford St., Strand, London, W. C. 2, 1947.

Here is a broad concept of nursing which includes many phases of the nursing field, a description of the practice of nursing, a history of nursing and a description of the responsibilities of those engaged in the profession. This new text written, as the author states in the preface, for the beginning nurse student, includes a brief description of all these phases. The principles of democratic philosophy are exemplified, as is the reconstructionists' philosophy of attaining democratic ideals.

Part I challenges the interest of the student at once by introducing her (or him) to professional nursing through a brief summary of nursing history and of nursing trends in the twentieth century. The student gains appreciation of the present status of nursing through a description of the studies which have guided the profession, and of other forces which have influenced the profession. A breadth of view and universality of outlook based on the assumption "that all should have equal opportunity for health" are presented in Chapters IV and V. The panoramic view of health problems presented by Miss Wolf will widen the student's prospective in contemplation of the kind of preparation she should seek. The student using this text will understand the nurse's role in bringing about needed changes in our social order, changes aimed at the goal of the democratic ideal welfare of all people, community betterment and individual development.

Part II of the text is concerned with the preparation and development of young nurses. It enlists their participation, at the outset of their educational experience in nursing, in carrying out the democratic philosophy. The description of principles and procedures is logically arranged and developed from the admission to the discharge of the patient from the hospital. The use made of the book, however, will depend chiefly on the competence and attitudes of the teacher. As the text stands, some may feel a need for a more clearcut emphasis on principles underlying nursing care and a need for more detail. Throughout, the emphasis is on health teaching and on consideration of the patient as an individual. The text illustrates the nurse's role as an interpreter of science and as a promoter of the welfare of the individual and of the social good. Written in a clear, direct manner, the text is easily understood.

Discrepancies in application of principles and failure to follow through in procedures are rarely noted. In these cases generalizations might be reinforced by specific suggestions for students at this stage of their educational process. The illustrations are purposeful and clear. There are well chosen references and a summary at the end of each chapter. The student will wish to add other references especially in health teaching. The author's greatest contribution is made in the integration of the social and health components in nursing.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address but these will be omitted on request.

IMMUNIZATIONS

To the Editor:—What is the recommended routine for dosage, time of administration and time of booster dose, in immunizations against pertussis, diphtheria, tetanus and smallpox?

Harry W. Orris, M.D., Brooklyn.

Answer.—Usually it is recommended that inoculations for the prevention of pertussis should not be given until after the sixth month of life. It is often claimed that there is little antigenic response before that time.

Dosage depends on the vaccine selected. One pertussis vaccine contains 15 billion inactivated organisms per cubic centimeter, and injections of 1, 2 and 3 cc. are made at from four to six week intervals. The total amount of vaccine given contains 90 billion organisms. Another vaccine contains only 10 billion organisms to 1 cc., and the total dose is 55 billion. Protection when established may last for approximately two years; after that time, unless there are exceptional circumstances reimmunization against whooping cough is seldom undertaken. However, if it is desired, 1 cc. of pertussis vaccine could be injected about two years after the initial prophylactic treatments.

Immunization against diphtheria and tetanus can be undertaken at any time after the child is 6 months of age, although 9 months of age is a more appropriate time. If diphtheria and tetanus toxoids are combined and the alum-precipitated preparation is used, two injections of 1 cc. each with an interval of six weeks is now considered satisfactory. After immunization has been established, as little as 0.1 cc. of tetanus toxoid, alum precipitated, may be given as a booster dose once every two years or annually as desired. In case of injury, if more than six months have elapsed since inoculations were made for immunization against tetanus, 0.5 cc. of tetanus toxoid, alum precipitated, should be administered immediately following the injury.

Vaccination against smallpox is best performed according to the multiple pressure method. If the baby is in good health and has no dermatologic condition, he may be vaccinated between the ages of 3 and 6 months. Vaccination before the completion of the first year of life is commonly advised. Revaccination should be performed when the child enters school at about 6 years of age. A third vaccination may be undertaken when grammar school is completed.

COCCIDIOIDOMYCOSIS

To the Editor:—A roentgenogram of the chest of a student suggests growth of fungus in the lungs. Dr. Biggs of the Mississippi State Health Department did not consider it tuberculosis. The tuberculin reaction was negative. He recommends that skin tests for fungous infections be made, coccidioidomycosis among others. Where can material for skin tests be obtained? Please suggest other methods for diagnosis.

Virginia E. Lane, M.D., Columbus, Miss.

ANSWER.—The tuberculin test should be repeated and animal inoculations of sputum and gastric washings should be carried out; on the basis of probability alone, pulmonary disease of a chronic nature should be considered tuberculosis until proved otherwise.

Although the diagnosis of coccidioidomycosis properly rests on the demonstration of Coccidioides immitis in tissue and a characteristic growth on artificial mediums, the intradermal test may be of great assistance. Coccidioidin may be obtained from Dr. John F. Kessel, chief microbiologist, Los Angeles County General Hospital, Los Angeles 33. This antigen is prepared in dilutions of 1:100 and 1:1,000 in merthiolate sodium (1:10,000). For routine use the 1:100 dilution is used. When primary, systemic coccidioidomycosis is suspected (as in the case cited), it would be wiser to use 1:1,000 dilution first. One tenth of a cubic centimeter is injected intracutaneously and the reaction is read in forty-eight hours. Reading and interpretation of tests are carried out precisely as one does with the familiar intracutaneous tuberculin test. A negative test militates strongly against the diagnosis of coccidioidomycosis. As with the tuberculin test, a positive reaction indicates that the patient has in the past become sensitized to the antigen; every effort should be made to isolate the organism.

Other fungous diseases which might cause confusion in the case mentioned would be blastomycosis and histoplasmosis. The former is unlikely, since the pulmonary form is as a rule rapidly fatal. The histoplasmin skin test may be used as a diagnostic measure in histoplasmosis. Biopsy of regional lymph nodes or microscopic and cultural studies of sputum and gastric washings are worth while procedures in the diagnosis of fungous growth in the lungs. Further advice should be obtainable either from Tulane or from Louisiana State University Medical School.

WATER SILICATE DEPOSITS

To the Editor:—The head plumber of our sanatorium reports that the hot and cold water pipes are developing a heavy layer of silicate. We are using a water softener system provided by the Elgin Softener Corporation, Elgin, Ill., and are using their "AC treatment" with causticized sodium silicate solution to prevent corrosion of the pipes. Is there any danger in the use of this water?

Robert A. Hollands, M.D., Battle Creek, Mich.

ANSWER.—The building up of a heavy layer of silicate in the water pipes suggests that the softened water is being overtreated with the causticized silicate solution. A check should be made to determine whether the dosage of silicate recommended by the manufacturer is actually being applied to the water. The chemical feeding apparatus may be out of adjustment. When the proper dosage of causticized silicate is applied to a softened water it will cause a thin film of silicate to be deposited on the inside surface of the pipe and will protect the metal from corrosive action. There is no danger to health from the use of water containing silicates. Objectionable tastes are likely to develop in the water from overtreatment with the caustic solution.

SMALLPOX VACCINATION

To the Editor.—Vaccination of a boy aged 22 months against smallpox did not take. His mother states that she was vaccinated against smallpox when she was six months pregnant. Is it possible that the boy acquired temporary immunity through his mother's vaccination? When should the boy be revaccinated?

Frederick E. Ems, M.D., Petaluma, Calif.

ANSWER.—It should always be assumed that a successful vaccination can be obtained on any one who has never had a successful vaccination; the only exception to this rule might be a person who has had an attack of smallpox. It is extremely doubtful that the infant acquired temporary immunity because the mother was vaccinated during pregnancy. Moreover, it would be interesting to know whether the mother's vaccination was successful. Further attempts should be made to secure a successful vaccination on the baby and perhaps also on the mother. This could be done at any convenient time, but preferably during cool seasons rather than in the summer months.

Theoretically the only reliable method to determine immunity to smallpox would be to secure a reaction of immunity when a vaccination is attempted. When designating a vaccination as a reaction of immunity, one must be certain that the vaccine is potent. If the vaccine is potent there should always be one of three reactions: *(a)* a successful vaccination, *(b)* a vaccinoid or accelerated reaction or *(c)* a reaction of immunity. If there is no reaction whatever, it should signify that the vaccine is not potent or that some flaw has occurred in the technic.

WORMS

To the Editor:—The treatment of choice frequently mentioned for Ascaris lumbricoides is hexylresorcinol, and for oxyuriasis, gentian violet medicinal. These drugs are prescribed in a capsule form which is difficult to administer to a patient under 2 or 3 years of age. Please advise method of treatment for these helminths in children under this age.

Loy T. Swinehart, M.D., Boise, Idaho.

ANSWER.—Hexylresorcinol ("crystoids anthelmintic," Sharp & Dohme, Inc.) is the drug of choice for the treatment of ascariasis because of its low toxicity and great effectiveness. The gelatin-coated pills are made in 0.1 and 0.2 Gm. sizes. Children are given 0.1 Gm. per year of age up to 10 years of age. A light evening meal is eaten, and the following morning the pills are taken with water. No breakfast should be eaten, but regular meals may be resumed at noon. Care should be taken that the pills are not chewed, as hexylresorcinol will produce transient superficial burns of the oral mucosa. Children who experience *difficulty* in swallowing the pills can easily do so if the pill is held in the back of the throat with the forefinger until the next swallowing reflex carries it down. A magnesium sulfate purge should be given twenty-four hours after the hexylresorcinol to wash out the dead and injured worms. A single treatment cures 70 to 80 per cent of infected persons. Reexamination of the stool for eggs, and retreatment, if necessary, should be done two weeks after the first treatment.

The treatment of oxyuriasis (enterobiasis) in children consists of oral administration of enteric-coated gentian violet pills. The usual dose is 10 mg. per year of age daily for ten days. The total daily dose is divided into thirds and given an hour before each meal. Thus a child 3 years of age would receive a total of 30 mg. per day. As the pills contain 3/20 grain (9.6 mg.), one pill would be given before each meal for ten days. A child 2 years of age would receive a 9.6 mg. pill before breakfast and another before supper. These pills must not be chewed, as gentian violet is extremely nauseating. Young children who cannot swallow the pills present quite a problem, because of the necessity of repeated doses for ten days.

Although not as effective as gentian violet, *tetrachloroethylene in a single dose will cure* approximately 50 per cent of enterobius infections and, being a liquid, it has the advantage of ease of administration. A liquid evening meal should be eaten, and the following morning the tetrachloroethylene administered at the rate of 0.1 cc. per year of age. The drug should be given with a magnesium sulfate purge. Children who vomit this mixture may have better success with a magnesium citrate purge. Food should not be eaten until the purge has acted. Retreatment, if necessary, may be repeated at intervals of two weeks.

RABBITS FOR FRIEDMAN TEST

To the Editor:—What are the qualifications of rabbits for use in the Friedman test? How old should they be? What is the best breed? At what age must males and females be separated? Can the males and females be kept in proximity to one another although separated?

William Sonnier, M.D., Scott, La.

ANSWER.—Friedman and Lapham (*Am. J. Obst. Gynec.* 21:405-410 [March] 1931) said the following:

"Inasmuch as the period of gestation in the rabbit is from thirty to thirty-two days, one may be certain that adult females strictly isolated from males for this period of time will not be pregnant, and that their ovaries will not contain either of the structures which characterize a positive reaction. Yet, if a number of females are kept together, it is possible that one doe may be "hopped" by another in heat and enter a period of pseudopregnancy which would last for about twenty days. It is desirable, therefore, that the females be kept isolated not only from males, but from other females as well by placing them in individual cages. It is not a difficult matter to arrange with a *rabbit dealer to have a sufficient stock of females* kept isolated in just such fashion for the desired period.

"If by any chance this is found difficult to arrange, one may buy adult females indiscriminately on the market and immediately place them in separate cages. After an interval of three weeks one can easily determine by palpation which of the rabbits are pregnant. Those that are not pregnant at this time may be used immediately. In the event that some of the animals deliver young during this period of isolation, they may be used within twenty-four hours after parturition. Indeed, an animal that has just delivered a litter is a most desirable animal for the test.

"In case one has not had opportunity to isolate the rabbits for the desired period, and it is found necessary to perform a test, it is safe to use a rabbit that has been isolated in the laboratory for only eight or ten days. Even if the rabbit in question had had coitus just before it was obtained, the corpora lutea of pregnancy or pseudopregnancy would then be at least eight or ten days old, and could not be confused with the fresh corpora lutea or corpora hemorrhagica produced by the injections of an active urine.

"Briefly, then, one may safely use all rabbits that are not *demonstrably pregnant at the end of* three weeks of isolation. In time of stress it will not cause confusion to inject a rabbit that has been isolated for only ten days, since the autopsy will disclose either that the corpora lutea are fresh, having been produced by the injections, or that the injected animal was pregnant or pseudopregnant, in which case the result of the test might be discarded and another animal subjected to the injections.

"It is understood, of course, that once the rabbits have been isolated for a sufficient length of time, they may be used at any time afterward."

WATER SOFTENING

To the Editor:—When water has hardness of 250 to 300 parts per million what amount of the usual softening chemicals is necessary to reduce hardness to relatively soft water, say 50 parts per million, using 1,000,000 gallons as a basis of estimate? What is the approximate current cost per pound of the softening agent? I live in a town of about 4,000 population and as health officer I am urging the town to soften its water.

N. Thomas Ennett, M.D., Beaufort, N.C.

ANSWER.—Since data are not given regarding the chemical composition of the water except that it has a hardness of 250 to 300 parts per million, it will be assumed that the water has a total hardness *of 300 parts per million, of which 250 parts per* million is carbonate hardness and 50 parts per million is noncarbonate hardness. It is assumed that there is also 40 parts per million of magnesium present. Such water would require the use of lime and soda ash for softening followed by additions of carbon dioxide for stabilization and *aluminum sulfate for coagulation of suspended* matter. The total cost of these softening chemicals is estimated at approximately 5 cents per 1,000 gallons of water treated. A plant of 1,000,000 gallons per day capacity is usually required for a community of 4,000 persons. At present prices, construction of such a plant will cost from $100,000 to $150,000. The cost of labor, maintenance, power, depreciation and financing must be added to the cost of chemicals to obtain the actual cost of softening.

MUMPS

To the Editor:—I was called to see a man with a temperature of 104 F. There was evidence of septicemia; he also had an epididymitis on one side. He did not respond to the usual treatment of fluids, salicylates and sulfathiazole. He was hospitalized, and intramuscular penicillin therapy was efficacious; the temperature dropped to normal within two days. It was difficult to make a diagnosis in this case, but three weeks later the mumps developed in his wife. As this case seems unusual, are there any cases on record where the parotid glands are not affected and the complication mentioned occurs?

W. J. Klinck, M.D., Lennoxville, Quebec.

ANSWER.—The case mentioned is unusual, but not extremely rare. There are many instances in which mumps occurs without swelling of the parotid glands. The submaxillary glands alone may be involved. In France particularly, where the literature in respect to mumps is especially extensive, cases of orchitis have been reported in persons following their exposure to mumps, although there seemed to be no evidence of the parotid glands being involved. Lightwood states: "Although parotitis is usually present, it must not be assumed that it is either primary or essential." This same author asserts further, "There is no evidence that the infective process begins in the parotid glands" (Lightwood, R.: Myelitis from Mumps, *Brit. M. J.* 1:484 [March 30] 1946.

PAINLESS CHILDBIRTH

To the Editor:—What are the salient features in the Read method for painless childbirth? How successful has it been?

A.A. Skemp, M.D., La Crosse, Wis.

ANSWER.—The query undoubtedly refers to Grantley Dick Read's method. Read has written a book, "Childbirth With Fear" (New York, Harper and Bros., 1944) and also an article (*J. Obst. & Gynaec. Brit. Emp.* 53:55-61 [Feb.] 1946). Sawyer found the Read method highly successful (*Am. J. Obst. & Gynec.* 51:852-858 [Feb.] 1946). Abstracts of Read's and Sawyer's articles may be found in J.P. Greenhill's "Year Book of Obstetrics and Gynecology," Chicago, Year Book Publishers, 1946, pp. 160-163. Parts of these abstracts are as follows:

> Read concludes that fear is the chief pain-producing agent in otherwise normal labor, that one should infer not that a woman is calm because her labor is easy but that her labor can be easy if she remains emotionally calm. The core of this hypothesis, now become a wisely accepted theory, is the concept of a pain-fear-tension syndrome in labor. Fear produces tension in the circular muscle fibers of the uterus, through sympathetic nerve stimulation, which then opposes action of the longitudinal fibers, which have *autonomic* innervation. Pain from the increased tension in the lower uterine segment and the cervix intensifies fear, causing further tension, and so on into the exhausting agony of a relatively obstructed labor. This vicious circle is most vulnerable to attack at the "point of fear," and the most effective method of minimizing pain is the establishment of complete faith in the mind of the woman, so that her labor can proceed in a state of neuromuscular harmony. This condition of mind can be built up during *antepartum* care and fostered at term if the attendant comprehends and takes advantage of the emotional phenomena characteristic of normal labor and delivery. On the other hand, disruption of the normal course of labor through loss of emotional control (including self-control of the operator!) brings on the serious complication of obstructed labor, one of the main causes of maternal morbidity.
>
> Sawyer maintains that "if a woman is taught to have no fear, to understand the processes of labor and to relax her skeletal muscles, the cervix will relax and allow itself to be transformed along with the isthmus into the lower uterine segment. At the end of the first stage, the head is forced through the cervix and this causes pain. The woman should be taught to expect this moment. At the end of this time, the pain caused by the distention of the cervix can be relieved by bearing down. The second stage lasted for about one hour in primiparas and for one or two pains, until the head is distending the perineum, in multiparas. The woman should work with abdominal and respiratory muscles as far as possible and relax the perineum so the head can be maneuvered over it. An anesthetic should be offered at the end of the second stage. If an episiotomy is necessary, the perineum is infiltrated with 'novocain and the episiotomy done."

TRIGEMINAL NEURALGIA

To the Editor:—What is the most effective therapy now in use for the relief of trigeminal neuralgia? The patient is 87 years of age and had had several attacks during the past two years.

A. Eleanore Conover, M.D., Cornish, N.H.

ANSWER.—The most effective therapy of trigeminal neuralgia is surgical. Under local anesthesia, the gasserian ganglion can be approached through an incision in the temporal area. A trephine opening is made through the squamous portion of the temporal bone and is enlarged to expose the floor of the middle fossa. The dura mater is raised from the floor, thus exposing the middle meningeal artery as it enters the *calvarium* through the *foramen* spinosum and the mandibular division as it makes its departure through the foramen ovale. The mandibular branch is traced posteriorly and superiorly to the gasserian ganglion. The preganglionic sensory fibers between the ganglion and the brain stem are divided completely or partially as indicated. Since *these fibers are incapable of regeneration*, there can be no return of pain. Age alone is no contraindication to this surgical procedure.

OBSTIPATION

To the Editor:—A male patient aged 82 is in fairly good physical condition except for an extreme degree of constipation. Roentgen examination reveals an enlarged colon, which the patient believes to date from severe typhoid at about 15 years of age. He was ill several weeks and had never been constipated prior to this illness. Constipation is now so extreme that bowel movements do not respond to liquid petrolatum. Salts are too drastic, as are castor oil and cathartic pills. His appetite is good; and he is active for a man of his age. Enemas are almost without result. Kindly advise me what is considered the least harmful laxative in a case of this kind.

V. Berry, M.D., Okmulgee, Okla.

ANSWER.—It is assumed that cancer of the distal colon and rectum has been excluded. The condition that has been described is probably either an acquired megacolon or more likely a distended, atonic colon not infrequently seen in the older age group, particularly in patients who have indulged in laxatives and cathartics over a long period of time. Regardless of the origin, in this age group the treatment would be the same. A standard diet should be prescribed that contains rather large amounts (at least two or three dishes each) of cooked fruit and cooked vegetables daily. Spinach and prunes should be included in the diet each day. Head lettuce, celery and whole wheat bread also help to form bulk. If spontaneous evacuation fails to occur with this regimen, the utilization of enemas every three to five days should be temporarily added to the program. From 6 to 8 ounces (180 to 240 cc.) of liquid petrolatum, olive oil or cottonseed oil introduced in the rectum at bedtime and allowed to remain overnight is usually an effective medicament. Small tap water enemas may also be employed as a temporary measure. The further use of laxatives or cathartics is unwarranted and is mentioned only to be condemned.

TATTOO

To the Editor:—Several years ago a query dealt with methods used in the removal of tattoos. Since the end of the war many former servicemen are anxious to have tattoo marks removed. Have there been any new methods developed? Can any places be mentioned specifically which engage in satisfactory methods of removing tattoos?

M.D., Ohio.

ANSWER.—There are many methods used in the removal of tattoos, but the best method is to tattoo thoroughly 40 per cent tannic acid into the lesion with electric tattooing needles until the skin presents a rubbery appearance. Then apply 50 per cent silver nitrate solution to the area, thus forming a hard black adherent crust. The treated area is bandaged and the crust is allowed to fall off naturally. It usually takes two treatments for a tattoo to be removed. Most dermatologists do this type of work.

CRETINISM

To the Editor:—What is the best present method of treatment for a cretin, first seen at the age of 4 months?

B. W. Coan, M.D., Galesburg, Ill.

ANSWER.—Few hospitals have facilities for carrying out basal metabolism tests on infants. It is therefore necessary to gage the dose of thyroid in early life by clinical changes in the patient. During the first year of life the dose of desiccated thyroid required is 0.1 grain (6 mg.) daily of the U.S.P. product. The dose is gradually increased to about 1 grain (0.06 Gm.) daily during adolescence. It is important to begin treatment as soon as the diagnosis is made and to give thyroid continuously for the rest of the patient's life. It is important not to give too much thyroid, because the drug produces palpitation, tachycardia and nervousness and may lead the parents to discontinue the child's treatment, with resultant hypothyroidism.

PSORIASIS

To the Editor:—Is there a hormone therapy available for the successful treatment of psoriasis? The patient, aged 24, with lesions for the past eight years, has had rather extensive topical treatment. She states that the lesions become more pronounced just before and during her menstrual periods.

M.D., Pennsylvania.

ANSWER.—There is some evidence to indicate a hormonal relationship to psoriasis, but it is still unsettled what the relationship is and which glands are involved. The thyroid, the pituitary, the pancreas and particularly the adrenals have all been considered at some time as important in psoriasis. Unfortunately, however, the treatment directed at these has not produced uniformly successful results. Recently Dr. Lawrence Frank (*New York State J. Med.* 47:1790 [Aug. 15] 1947) in a small group of cases attempted to stimulate the adrenal glands indirectly through the action of diethylstilbestrol on the pituitary gland; his results also were not uniform, although he considered the attempt as not unsuccessful. Patients in whom psoriasis had been present only a short time responded well, but such patients ordinarily respond well to treatment with the usual topical measures. Frank had the impression that even his patients with chronic psoriasis were benefited by the treatment, which consisted of a combination of diethylstilbestrol and topical measures. In general, however, therapy with hormones is not used either regularly or routinely for the treatment of psoriasis.

RECURRENT ULCER OF THE MOUTH

To the Editor:—The answer on page 433 of THE JOURNAL for February 7 on the subject "Recurrent Ulcers of the Mouth" fails to mention two other effective forms of therapy. Repeated vaccination with smallpox vaccine was first recommended by F.R. Schmidt (Vaccination for Herpes, *Arch. Dermat. & Syph.* 32:105, 1935). At least ten vaccinations are given on a different area of the skin at seven to ten day intervals. The entire course of vaccinations should be given even though no "take" is secured. Vaccination therapy should not be started during the acute stage of the lesions. It is not unusual for the patient to experience an exacerbation of the lesions following the initial vaccination. This form of therapy is quite effective. Estrogen ointment locally applied, approximately 25,000 rat units a week with 1,000 units per gram (0.05 Gm.) of ointment has also given satisfactory results in some patients.

Lester W. Burket, D.D.S., M.D., Philadelphia 4.

SICK PETS

To the Editor:—The formula proposed in THE JOURNAL, January 24, page 289, "veterinary nembutal," would cost $45 at $5 per ounce (28.35 Gm.) for pentobarbital sodium. Prepared by Abbott Laboratories, this formula is stable in solution but is not always stable when prepared by the pharmacist. The recommended dose, 65 mg. per kilogram of body weight, is lethal to most cats and dogs, but as a few will survive, this cannot be considered humane and the formula of choice. However, if it is used, a bilateral pneumothorax should be produced while the animal is anesthetized in order to assure lethal outcome. Additionally, the most humane method of administration is intravenously or intraperitoneally. When such a course has been decided on, the following medicaments are preferable for disposition of sick and injured pets:

Dogs.—(1) 10 cc. of 10 per cent potassium chloride by intravenous injection. (2) 20 cc. of 95 per cent ethyl alcohol intravenously, followed by 20 to 40 cc. of air embolus until respiration and heart action cease. (3) 30 mg. of strychnine by the intravenous route. (4) 10 cc. of 20 per cent magnesium sulfate per 5 pounds (2.3 Kg.) of animal weight intravenously. NOTE: These agents produce immediate death without convulsions when given directly into the vascular system. After the first intravenous injection, which produces anesthesia, if subsequent injections are needed they may be given by the intracardiac method. Ether and potassium cyanide are considered undesirable and inhumane, as they tend to produce convulsive deaths.

Cats.—As cats are much more difficult to handle, injections into the vascular system are contraindicated. With these animals the use of chloroform (1 ounce) or ethyl chloride (½ ounce, 14 Gm.) in a tightly closed container produces a quick and painless death.

Larger Animals.—The horse dies instantly and painlessly without convulsions when given 1 grain (0.06 Gm.) strychnine intravenously. This method may be used for the disposition of horses and other large animals on farms. The use of veterinary pentobarbital in the larger animals is not only much more costly but, as previously noted, the solution may become unstable and therefore give poor, or negligible results. From long practice the formulas here given are considered to be by all means the most efficient and humane. Whenever possible, decision for such action and the handling of the case should be based on recommendations of an experienced veterinarian.

C.C. Pfeiffer, M.D., Chicago 12.

RECURRENT ULCER OF THE MOUTH

To the Editor:—On page 433 of THE JOURNAL, February 7, the answer to the query regarding recurrent ulcers of the mouth takes up a great many improbable explanations but rather lightly passes over the most probable diagnosis; i.e., aphthous ulcers, which are now generally considered to be a variant of herpes simplex of the recurrent type. Repeated vaccination as for smallpox will frequently put a stop to the recurrent attacks or at least ameliorate them. Intradermal injection of the contents of the capillary tube of vaccine once daily for four or five days is the most effective technic, but if too much difficulty is encountered in transferring the vaccine from the capillary tube to a tuberculin syringe (in 0.1 cc. of isotonic sodium chloride solution) repeated scarification may be substituted. If the patient is likely to get a "take," the first vaccination should be followed by an appropriate waiting period, so that the possibility of multiple takes will be avoided.

A TEST FOR ADRENAL CORTICAL INSUFFICIENCY

The Response to Pituitary Andrenocorticotropic Hormone

George W. Thorn, M. D.
Peter H. Forsham, M. D.
F. T. Garnet Prunty, M. D.
and
A. Gorman Hills, M. D.
Boston

The recent preparation of a purified pituitary adrenocorticotropic hormone in sufficient quantity for use in human subjects[1] has provided an opportunity to stimulate directly the human adrenal cortex.[2] It appeared likely that, in patients suffering from primary adrenal cortical insufficiency, the normal response to this specific stimulus would fail to occur. This expectation has been substantiated by clinical studies.[3] The development of a simple test for adrenal cortical insufficiency based on the failure of patients with Addison's disease to secrete cortical hormones in response to the pituitary adrenocorticotropic hormone has been the aim of this study.

Among the numerous metabolic[3] and hematologic[4] changes which follow administration of the hormone in subjects with an intact adrenal cortex, two have been selected as the basis for a clinical test for adrenal cortical reserve because of their simplicity of determination and magnitude of change: (1) a fall in circulating eosinophils, measured by direct enumeration in order to attain the necessary accuracy, and (2) an increase in urinary excretion of uric acid conveniently expressed as a change in uric acid-creatinine ratio. This obviates the necessity for accurate collections of urine.

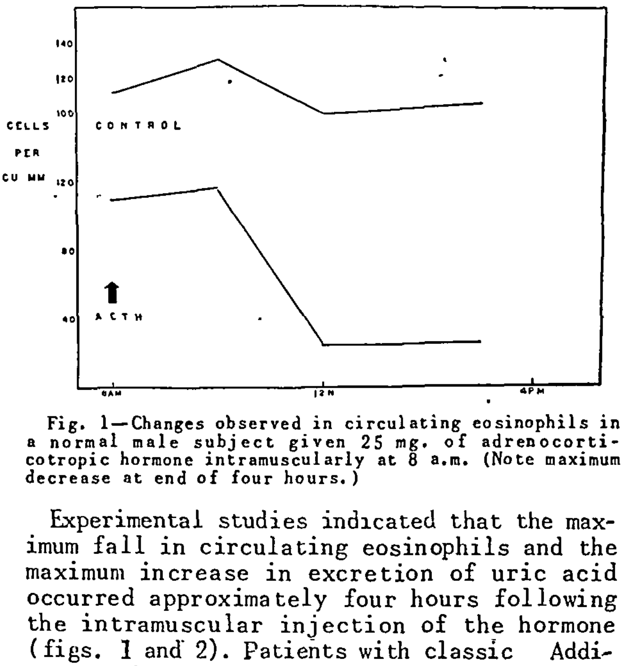

Fig. 1—Changes observed in circulating eosinophils in a normal male subject given 25 mg. of adrenocorticotropic hormone intramuscularly at 8 a.m. (Note maximum decrease at end of four hours.)

Experimental studies indicated that the maximum fall in circulating eosinophils and the maximum increase in excretion of uric acid occurred approximately four hours following the intramuscular injection of the hormone (figs. 1 and 2). Patients with classic Addison's disease failed to show these changes after administration of the hormone. On the basis of these differences a test for adrenal cortical insufficiency has been standardized.

PROCEDURE FOR THE TEST

No food is given after 8 p.m. on the day preceding the test; water may be had as de-

---

From the Department of Medicine, Harvard Medical School and the Medical Clinic, Peter Bent Brigham Hospital, Boston. Rockefeller Travelling Fellow (Dr. Prunty).

This study was aided in part by a grant from the Committee on Research in Endocrinology, National Research Council.

[1] The purified hog pituitary adrenocorticotropic hormone used in this study was provided by Dr. John R. Mote of the Armour Laboratories, Chicago. Intravenous administration of 2 to 4 micrograms into a hypophysectomized rat provoked a decided decrease in the ascorbic acid content of the adrenals. Electrophorectic analysis revealed the presence of more than one component. The material contains the equivalent of 0 12 unit of oxytocic activity per milligram; growth-promoting. gonadotropic and thyrotropic factors are not present in significant amounts.

the uric acid-creatinine ratio rose 103 per cent. The fasting uric acid-creatinine ratio was 0.81 during convalescence in contrast to the value of 1.3 derived during the height of the fever. These tests suggested that the adrenal cortex had apparently regained much of its reserve.

TABLE 2—*Mean Fasting Urinary Uric Acid-Creatinine Ratio in a Group of Sixty Persons with Normal Renal Function*

Group	Mean Fasting Uric Acid–Creatinine Ratio					
	Males		Females		Mean	Mean Deviation
	No.	Ratio	No.	Ratio		
Normal	7	0.43	4	0.59	0.50	0.17
Miscellaneous diseases not involving the adrenal cortex primarily	12	0.54	14	0.68	0.63	0.15
Addison's disease	11	0.49	12	0.59	0.54	+0.15

At times a failure of the urinary uric acid-creatinine ratio to rise may be due to renal failure rather than adrenal insufficiency. Experimental evidence[2c] indicates that the adrenocorticotropic hormone induces an increased renal clearance as well as an increased production of uric acid. Thus, impaired renal clearance of uric acid may prove to be the factor which limits or prevents a rise in uric acid—creatinine ratio. In rare instances (for example, in cases of gout or leukemia) the physiologic limit of excretion of uric acid already has been reached before the administration of the hormone. In these circumstances only a minimal rise in uric acid—creatinine ratio will occur even though adrenal response is normal. In either case, however, this type of response will be accompanied with a fall in eosinophils and a rise in the level of uric acid in the serum.

M.McD., a women aged 53, with uncontrolled hyperthyroidism, had a basal metabolic rate of + 60 per cent and appeared to be unable to increase uric acid clearance. The results of the usual renal function tests were normal. When given the adrenocorticotropic hormone test she showed a fall in eosinophils of 85 per cent. The uric acid–creatinine ratio increased only 34 per cent from an initial value of 0.72 (high normal). There was, however, a significant rise in serum uric acid (fig. 4). The patient thus appeared to have adequate adrenal cortical reserve, as judged by a decrease in circulating eosinophils and a significant rise in the level of uric acid in the serum. Indeed, six weeks later, when the patient's basal metabolic rate had been reduced to + 12 per cent, her response to another adrenocorticotropic hormone test was entirely normal. Eosinophils fell 85 per cent; uric acid—creatinine ratio rose 91 per cent, and the serum uric acid did not change.

COMMENT

The two indexes of adrenal cortical function which are determined in this test depend presumably on the activity of only one group of cortical hormones, the steroids oxygenated at the C-11 and C-17 positions. This is demonstrated by the fact that such a steroid administered to either normal subjects or patients with Addison's disease causes a rise in the uric acid-creatinine ratio and a fall in circulating eosinophils (table 3); whereas desoxycorticosteronem which lacks the oxygen at the C-11 position, produces neither. The oxysteroids are known to be concerned with the regulation of carbohydrate, fat and protein metabolism. Strictly speaking, the test measures adrenal cortical reserve function only with respect to these factors. Adrenocorticotropic hormone has also been found to stimulate the secretion of the androgenic and electrolyte-regulating factors of the human adrenal cortex as well,[2c] but the measurement of these changes is complicated, and they do not lend themselves readily to use as a clinical test.

The simplicity of the present test permits its application not only to patients presenting signs and symptoms of primary adrenal cortical insufficiency but also to patients in various stages of adrenal exhaustion following a variety of stresses. In patients with adrenal insufficiency secondary to anterior pituitary deficiency a satisfactory response to adrenocorticotropic hormone is anticipated when the adrenal cortex has not undergone permanent atrophy; whereas patients with primary failure of both glands fail to react. The test should prove useful in obtaining an approximate estimate of the "carbohydrate-regulating" capacity of a patient with Addison's disease and will serve as a means of gaging the desirability of supplementary adrenal cortical extract therapy.

TABLE 3.—*Effect of Adrenocorticotropic Hormone, Desoxycorticosterone and Compound F on Eosinophils and Excretion of Uric Acid*

	Number of Cases	Treatment	Percentage Fall in Eosinophils	Percentage Rise in Uric Acid-Creatinine Ratio
Normal subjects	8	25 mg. ACTH [*]	78	102
Normal subjects	2	30 mg. DCG. [†]	-4	24
Persons with Addisonian disease	16	25 mg. ACTH	0	22
Persons with Addisonian disease	3	20 mg. Compound F[‡]	71	57

[*] Adrenocorticotropic Hormone

[†] Dr. E. Oppenheimer of Ciba Pharmaceutical Products, Inc., supplied the water-soluble desoxycorticosterone glucoside.

[‡] Compound F, 17-hydroxycorticosterone, was supplied by Dr. M. H. Kuizenga, of the UpJohn Company, Kalamazoo, Mich.

The dual character of the test (blood count and renal excretion) and the parenteral administration of hormone provide a highly specific response and offer some opportunity to bypass disorders of renal function which have limited the usefulness of other tests. As a screening test it supplements, but does not necessarily correlate with, the salt[8] and water[9] tests which estimate the desoxycorticosterone-like activity of the adrenal

cortex and the 17-ketosteroid determinations[10] which measure its androgenic activity. The test appears to correlate best with the excretion of 11-hydroxysteriods as estimated by chemical means. [11]

SUMMARY

Two striking and easily determined changes (a decrease in circulating eosinophils and a rise in excretion of uric acid) consistently follow the administration of a single dose of 25 mg. of purified pituitary adrenocorticotropic hormone to normal subjects and patients with diseases not involving the adrenal cortex. It is suggested that a decrease of 50 per cent or more in the urinary uric acid—creatinine ratio indicates adequate adrenal cortical reserve. The test as outlined appears to be a measure of the adrenal reserve of hormones regulating carbohydrate, fat and protein metabolism. The use of this test in the diagnosis of adrenal insufficiency is discussed.

DIPHTHERIA IMMUNIZATION

Use of an Alum-Precipitated Mixture of Pertussis Vaccine and Diphtheria Toxoid

JOSEPH A. BELL, M. D.
SENIOR SURGEON
UNITED STATES PUBLIC HEALTH
SERVICE
Bethesda, Md.

There has been a downward trend in United States mortality from diphtheria and pertussis, but current reports show that several thousand young children continue to die every year from these diseases. Many deaths from these diseases will be prevented when effective prophylactic agents are extensively used. Such agents will be used more extensively when demonstrated improvements are made which increase their protective efficiency, decrease the number of reactions and simplify their method of administration.

To these ends considerable progress has been made in recent years. Diphtheria prophylactic agents have progressively improved from the old toxin-antitoxin mixtures to fluid toxoid and, now, alum-precipitated diphtheria toxoid. In 1938 Harrison and his associates [1] introduced alum-precipitated pertussis vaccine and it became evident that the method for immunizing children might be simplified through mixing precipitated pertussis and diphtheria antigens for simultaneous administration. In 1940 Schutze concluded from animal experiments that the admixture of alum-precipitated toxoid and pertussis vaccine does not impair the antigenic potency of either product.[2] In 1938 to 1940 Volk and Bunney [3] found that two doses of alum-precipitated diphtheria toxoid, when given to children 8 months of age and older with a three-week interval between doses, were the simplest and most effective procedure for immunization against diphtheria. Simultaneously in 1938 to 1941 Bell [4] found that two doses of alum-precipitated pertussis vaccine, when given to children 2 months to 2 years of age with a four-week interval between doses, conferred substantial protection against pertussis. Successful immunization at this young age was later confirmed by Sako and his associates.[5] From 1941 to date many reports [6] have appeared which are favorable to the use of an alum-precipitated mixture of these antigens; however, reports covering well controlled trials in the general population are scanty. This is unfortunate because clinical trial and experience constitute the ultimate test of the value of any prophylactic agent.

A clinical trial of a prophylactic agent presents many difficulties and may easily be fraught with errors unless properly planned and carried out. There are many known and unknown attributes which influence immunologic phenomena, and unless a clinical trial takes all these influences into account, one can never be certain that a particular phenomenon was the result of a particular treatment given. This study of an alum-precipitated mixture of pertussis vaccine and diphtheria toxoid utilizes a method for evaluating the immunity conferred by this product which takes account of all known and unknown attributes which might influence immunity to these diseases. The data are too extensive for immediate analysis and inclusion in a single report; hence this report is limited to the aspects of the study which relate to diphtheria immunization. This report outlines the objectives and fundamental criteria which were predetermined as essential to account for all attributes which might influence diphtheria immunity. It describes the preparation of the antigens used and the procedures used to fulfill the fundamental criteria, and it makes an analytic check (tables 1, 2 and 3) on the effectiveness with which the criteria were fulfilled. The report identifies all known attributes which influenced diphtheria immunity in this study and takes account of these and unknown influences in evaluating the effects of the study product given.

OBJECTIVES

In 1941 a fully controlled epidemiologic trial of an alum-precipitated mixture of

diphtheria toxoid and pertussis vaccine was undertaken in Norfolk, Va. The trial was carried out in a manner to show what could be expected through routine use of this product in young children of the community. The main objectives were to answer the four questions: (*a*) Will two doses of an alum-precipitated mixture of diphtheria toxoid and pertussis vaccine protect young children against diphtheria as well as ordinary alum-precipitated diphtheria toxoid? (*b*) Will the mixture give substantial protection against clinical pertussis? (*c*) Will the mixture protect against both diphtheria and pertussis when given to children 2 to 5 months of age? (*d*) Will the mixture cause more local or general reactions than ordinary alum-precipitated diphtheria toxoid?

FUNDAMENTAL CRITERIA FOR STUDY

To answer the foregoing questions on diphtheria immunity, it was predetermined that the following fundamental criteria would be essential for an adequate and fully controlled clinical trial of the mixed product. The criteria are listed as outlined in 1941 and all have been meticulously adhered to throughout the study.

(*a*) An alum-precipitated mixed or test product and an alum-precipitated unmixed or control product must be prepared so that each dose of each product contains the same quantity of alum-precipitated diphtheria toxoid from the same lot of crude toxoid. The test and control products must be prepared so that each will be identical in all respects except that each dose of the alum-precipitated diphtheria toxoid in the mixed product will contain 10,000,000,000 killed Hemophilus pertussis organisms.

(*b*) A study group of children must be preselected so as to be an adequate and representative sample of young children in a sizable United States community who are routinely available for voluntary immunizations. This is essential so that the results of the study may safely be projected to reflect the results expected from general use of the study products.

(*c*) A predetermined strictly random sampling procedure, based on a simple attribute entirely unrelated to immunologic phenomena, must be used to divide the study children into a test and a control group. This is essential to insure that all known and unknown attributes which might influence the occurrence of diphtheria or pertussis immunity (aside from the study products given) would be distributed between the two groups as equally as possible within the range of chance sampling variation.

(*d*) No person other than the visiting nurse observers and the physicians conducting the study should know that a study of pertussis vaccine is involved, and neither the nurses nor the physicians should know which child belonged to the test or control group, or which child received which study product, or whether any one child received the same product as any other child. This is essential to neutralize any possible human bias on the part of observers or informants in the recognition of immunologic phenomena. This is also essential to maintenance of the test and control groups as strictly random samples of the combined groups throughout the period of observation. When no one knows that pertussis vaccine has been given to any of the study children, no disproportionate treatment can be given to either of the random groups and all known and unknown attributes will have a nearly equal influence on each group; e.g., a nearly equal proportion of each group will receive pertussis vaccine by private physicians, and a nearly equal proportion of each group will depend on immunization rather than shielding their child from exposures to pertussis and other diseases.

(*c*) An intensive effort must be made to see that two doses of the test or control product are given to each study child as selected by the predetermined sampling process, that the products be given with a four-week interval between doses to children in the age band 2 to 23 months and that the products be given without inquiry or regard to a prior history of pertussis or pertussis vaccination. All children who receive at least one dose of the study product must be placed under uniform and routine monthly observation as long as they remain in the study area by one of the two specially trained public health nurses.[7]

---

[7] Public Health Nurses Anne Hodges and Ruth Sargent carried out the previous study[4] and were the mainstays of the present study through the period covered by this report. Most of the Schick tests were carried out by Public Health Nurse Edna McCaleb under my supervision and that of Dr. J. P. Leake, who read and interpreted the Schick reactions in all children having any reaction whatsoever.

(*f*) A controlled Schick test is to be used as an index of diphtheria immunity, and a single lot of Schick toxin is to be used throughout the study, providing tests on animals indicate its potency is maintained. An intensive effort must be made to give Schick tests to all children remaining under observation one year after receiving the study products and simultaneously to give Schick tests to the mothers of such children. All disease diagnoses must be made, and all Schick reactions read and classified by me or by Dr. J. P. Leake.

dose value of 6 and an L+ value of 0.30 unit per dose.[8] Each dose of the mixed and unmixed product contained the same quanity of diphtheria toxoid and differed only in that each dose of the mixed product contained 10,000,000,000 killed H. pertussis organisms.

STUDY PROCEDURE

The study is being conducted in cooperation with the Norfolk City Union of the King's Daughters Visiting Nurse Association and with the assistance of the state and local health departments and physicians. The study area is in Virginia and comprises the cities of Norfolk and South Norfolk and the Tanners Creek District of Norfolk County. The population of the entire area is estimated at 250,000, of which 69 per cent are white and 31 per cent Negro. The study area was divided into fourteen geographic subdivisions in an effort to group people according to their usual associations at schools, churches, theaters and shopping centers. Each geographic section contained one King's Daughters Well Baby Health Station, and diphtheria immunization was urged for all infants 2 to 23 months old who attended these stations from January 1942 to July 1943. Using the current birth certificates in Norfolk, the Health

PREPARATION OF STUDY PRODUCTS

The study products used were prepared by Parke, Davis and Company according to my specifications. They were purchased in 1941 in a quantity sufficient for the entire study and stored until used at 4 to 7 C. A single lot of fluid diphtheria toxoid was used in the preparation of both the mixed and unmixed product. For the mixed product 2 parts of the toxoid were mixed with 1 part of a suspension containing 30,000,000,000 phase I H. pertussis organisms per cubic centimeter which were grown on Sauer's blood agar and killed with a 1:10,000 solution of "merthiolate." For the unmixed product 2 parts of the toxoid were mixed with 1 part isotonic solution of sodium chloride instead of the pertussis suspension. Separately the mixed and unmixed products were then precipitated by adding 4 per cent alum solution and the precipitates washed twice. The products were passed through a colloid machine in order to obtain a fine division of the alum precipitate and finally were subjected to the usual sterility and safety tests. Titrations of both the mixed and unmixed products indicated that there was slightly less than 0.1 per cent alum equivalent in each. The crude toxoid had a least fatal dose value of 9, and each dose of the mixed and unmixed products by calculation had a least fatal

---

[8] Dr. D. R. Mathieson, under direction of Dr. Noble Ferry and the late Dr. L. T. Clark, all of Parke, Davis and Company laboratories, carried out a few laboratory tests with the mixed product. The results were: "A. 100 per cent of sixteen 270 Gm. guinea pigs survived six weeks when challenged in groups of 4 with 10, 20, 40 and 80 minimum lethal doses of Corynebacterium diphtheriae toxin, respectively. Three such guinea pigs out of 4 similarly survived 160 minimum lethal doses. All had previously received a 1 cc. subcutaneous dose of the mixed antigen. Five such guinea pigs used as controls received no previous antigen and all died within six weeks after receiving only 1 minimum lethal dose of the same diphtheria toxin. B. Eighteen guinea pigs inoculated with the mixed antigen and then sacrificed fourteen days after receiving 10 to 160 minimum lethal doses of diphtheria toxin showed not the slightest vestige of reaction to the toxin, whereas the 1 control guinea pig given only 1 minimum lethal dose died in four days showing pleural effusion and massive hemorrhages of the adrenals, subcutaneous tissue, and abdominal muscles at the site of inoculation."

Department sent letters to the mothers of all 2 to 12 month old children urging immunization against diphtheria and smallpox. Local health department personnel administered the study products, and neither they nor the recipients knew that pertussis vaccine was involved in the study. The mixed and unmixed products were in 20 dose identical vials, each of which was numbered and labeled only "A-P Diphtheria Toxoid." If a code combination of the digits of a vial number was odd, it was to be given to children born in an odd month; i.e., January, March, May, etc. If the code combination was even, it was to be given to children born in an even month, February, April, June, etc. Thus birth in an odd or even month was the basis for dividing the children into a random test group and a control group each of which would have a nearly equal distribution of all known and unknown attributes which might influence diphtheria or pertussis immunity. At the health station an identifying record card was prepared for each child, and the card turned over to the Public Health Service visiting nurses after the child had received two doses, or in any event after two months had elapsed since the first dose. The visiting nurses prepared household rosters and made routine monthly visits, and more frequent visits during the occurrence of communicable disease, to all study children and have continued such visits to date. Under my close supervision and that of Dr. Leake the nurses made a record of all known and suspected attributes which might influence diphtheria or pertussis immunity. No child has been dropped from the study unless he permanently moved away from the area or otherwise became non locatable. Neither the visiting nurses nor I knew which children received which product, or which child belonged to which group, or whether any child received the same product as any other child.

From February 1943 to July 1944, six regular Schick testing clinics were held and an effort made to give the Schick test to all children who received the first dose of the study products twelve or more months previously. In February and again in May 1945, an effort was made to give the Schick test to the few remaining children who were under observation and who had not been tested previously at the regular clinics. All mothers who [illegible] at the time of the Schick test were invited to have a Schick test. A single lot of Schick toxin, stabilized with human serum,[9] was used throughout the study. It was tested for potency in guinea pigs at various intervals. All Schick reactions were read on the fourth or seventh day by me or by Dr. J. P. Leake. All were classified as either positive or negative, as a decision had to be made with respect to further immunization.[10]

* "p" equals the probability of occurrence of this distribution by chance.

EFFECTIVENESS WITH WHICH CRITERIA WERE CARRIED OUT

Table 1 was prepared to check the effectiveness with which the method pursued in obtaining the study children provided a study group which was an adequate and representative sample of all young children in the area who are routinely available for voluntary immunization. The method of selection must be relied on to establish representativeness, but a few crude checks are available. If the study group is representative it would be expected to have a disproportionately large number of children from large families, to have a disproportionately large number of Negro children, and to have no disproportion by sex.[11] Table 1 compares the study group with estimates prepared from vital statistics reports on color, sex and family size. It shows that the expectations were fulfilled. This crude but confirmatory check permits the belief that the study group is adequate in size and representative to the extent that the results from the use of the study products may be projected to portray that which would result from their routine use in the study area.

Table 2 was prepared to check the effectiveness with which the sampling procedure was carried out to divide the study children into a comparable test and control group The predetermined and meticulously executed random sampling procedure based on an odd or even month of birth (an attribute entirely unrelated to diphtheria or pertussis immunity) should divide the study children into a test and a control group so that each group will have a nearly equal distribution of all known and unknown attributes which might influence the occurrence of diphtheria or pertussis immunity aside from the influence of the study products given. This can be checked by observing whether all known and suspected attributes are equally distributed within reasonable limits of chance sampling variation. It must be pointed out, however, that only a check can be made and that the meticulous execution of an adequate and predetermined sampling procedure is the all important factor. In the absence of such a procedure there can be no assurance that a disproportionate distribution of an unknown attribute may not have occurred and significantly influenced the results in an unknown manner and to an unknown extent.

---

[9] The Schick toxin and the heated control material used were prepared by Dr Geoffrey Edsall at the Antitoxin and Vaccine Laboratory of the Massachusetts Department of Health (Edsall, G., and Wyman, L.: Am. J. Pub. Health *34*: 365, 1944). In October 1942 he sent to the National Institute of Health a quantity of the diluted material sufficient for the entire study. It was promptly placed in the refrigerator, where the temperature was kept between 4 and 7 C. A quantity sufficient only for each clinic was transported to Norfolk in ice and kept on ice until the day of use.

[10] Many of the Schick reactions were observed on the second, fourth and seventh day. Observation consisted of measuring and recording the transverse and longitudinal diameters of each zone of reaction at the test and control site and noting the presence of redness, edema, wrinkling and desquamation Reactions were classified according to the area of clear definite redness on the fourth to seventh day following injection. The area was computed by assuming it equivalent to a circle with a diameter equal to the mean of the vertical and transverse measurements. If the area of redness at the test site exceeded the area of redness (if any) at the control site by the area of a circle 10 mm. in diameter, the reaction was classified positive; otherwise the reaction was classified negative The reaction was classified negative in the few instances in which definite evidence existed that the maximum local reaction at the test site occurred within forty-eight hours after injection and the nature of the reaction was similar to that at the control site. The reaction was classified as positive in a few instances (particularly in the Negro where discolorations are less evident than in the white skin) in which, because of the intensity and duration of the reaction, the original observer (J.A.B. or J.P.L.) judged it to be positive even though the measured area of redness was slightly less than has been set forth. All reactions were observed and classified without knowledge as to what immunizations the child may have received.

[11] These are the characteristics expected in groups of children who respond to routine public pleas for immunization and constitute the mass of children generally immunized.

Table 2 shows that 52.2 per cent of the total 1,238 children who entered the study were born in an odd month. It lists a few known and suspected attributes which might influence diphtheria or pertussis immunity in this study. (Others may be observed in table 4.) It will be noted that in all attributes except those relating to the study products given, close to 52 per cent of the children were born in an odd month. It is also pertinent to note that some 97 per cent of the children receiving two doses of the same product received the product intended. Twenty-four children, 13 odd and 11 even, received two doses of the wrong product because they gave the wrong birth date at both visits to the clinic for injection. They are hereafter tabulated according to the product received. Thirty-three children, 24 odd and 9 even, received one dose of each product. A few of these gave the wrong birth date at one clinic, but the disproportion was due entirely to the fact that in the early part of the study the persons giving the study products thought that the number zero on a vial was an odd number. This was promptly corrected, and although these 33 children have been carried under observation, they are not counted in tabulations comparing the study products. In table 4 it is pertinent to note that of the small percentage of children who received pertussis vaccine prior to Schick test from sources outside the study 53.8 per cent were born in an odd month. This confirms the statement that none of the parents knew that pertussis vaccine was involved in the study. It is obvious that the procedures used in this study gave two groups of children, one of which received two doses of the mixed and one of which received two doses of the unmixed product, and each of which had a nearly equal distribution of all known and suspected attributes which might influence diphtheria or pertussis immunity in these children. Aside from the study products given, no one of these attributes deviated beyond what might be expected through chance sampling variation, thus confirming that the sampling procedure was effectively carried out and insuring that all unknown attributes are similarly distributed between the two groups.

Table 3 was prepared to check whether the single lot of Schick toxin used throughout the Schick testing period remained of uniform potency. In each of the seven groups of mothers and children given Schick tests at various time intervals there was no significant variation in the percentage of positive reactions. In the laboratory tests all animals used died and had pathologic changes demonstrating death from diphtheria toxin. There was no significant variation in the average survival time at the different dates on which the toxin was tested. Thus it is concluded that the Schick toxin used remained remarkably uniform in potency throughout its long period of use.

RESULTS

Table 4 was prepared to identify attributes which may have influenced the Schick reaction. It lists all known and suspected attributes which might influence diphtheria immunity and shows for each the results of Schick tests performed one year after immunization. It shows the number of children tested according to the product received and the number and percentage who were Schick positive; i.e., who failed to be immunized. The "P" is the calculated probability of a difference in the number of Schick reactors as great or greater than observed occurring through chance sampling variation of independent attributes. Yates modification of Chi square was used in computing the "P" on all fourfold tables having less than 10 persons in any cell. In attribute 1, 32 per cent of the children who received only one dose of a known product were Schick positive as compared with 10 per cent who received two doses. This difference is consistent and significant both in the children receiving the mixed and in those receiving the unmixed product. On account of this finding the remainder of table 4 includes only children who received two doses of the same known product. It will be noted that children receiving the unmixed product had about three times as many Schick positive reactions as those receiving the mixed product, and this difference is consistent and fairly uniform throughout all attributes tested. It will be noted that attributes 2 to 11 inclusive were not significantly associated with the Schick reaction in this experience.[12] In attribute 12, age at time of injection, it is significant that children who received both their doses before they were 6 months of age had a higher proportion of Schick positive reactions than those who received at least one of their doses when they were 6 months of age or over. It will be noted that there is an association of questionable significance between the Schick reaction and the remaining attributes 13, 14 and 15. In summary of table 4 it appears that the Schick reaction is definitely correlated with the type of study product received, the number of doses received and the age at time of injection. There appears to be a correlation of questionable significance between the Schick reaction and the attributes concerning breast feeding at time of first dose, race and the presence or absence of other children in the household less than 10 years of age. There appears to be no correlation between the Schick reaction and any of the other attributes observed.

The significant correlations observed in table 4 do not suffice to answer the questions propounded on diphtheria immunity. For example, it is obvious that the group of children given injections at the earlier age must include a large proportion of children who were still feeding at the breast, and it must be determined whether age at time of injection or breast feeding or both were responsible for the correlations. Other similar but perhaps not so obvious relationships may exist between the various attributes listed in table 4. Thus it is necessary to examine further all the correlations observed in order to answer the questions propounded on diphtheria immunity. This involves a multitude of tabulations, far too many for publication, and hence only table 5 is presented to exemplify the procedure used.

Table 5 was prepared to determine whether the questionable correlation between the Schick reaction and breast feeding at time of first dose was due to breast feeding or to the result of interrelationship with other attributes. It shows the results of the Schick test according to breast feeding at first dose among the 849 children who received two doses of the study product and on whom a history of breast feeding was obtained. The total group of 849 children are subdivided according to the age at time of injection, the presence or absence of other children less than 10 years of age in their household, and the study product received. In each subdivision the number of children tested and the observed number of Schick positive reactions is recorded and the "T," the theoretically expected number of positive reactions, is computed. The computation is based on the assumption that breast feeding exerted no influence on the Schick reaction, and the "T" is derived by applying the percentage positive in the total of each subdivision to the number of children tested. By summation it is found that among the 425 children who were still feeding at the breast at first dose 52 Schick positive reactions were observed and 50 Schick positive reactions were expected after adjusting for the influence of other attributes. Thus it is concluded that breast feeding did not significantly influence the Schick reaction in this experience. A table was prepared and treated precisely in the same manner as table 5 except that race was substituted for breast feeding. The computed "P" was .688, and it is concluded that race did not significantly influence the Schick reaction in this experience.

---

[12] Some of these attributes are known to be correlated with the Schick reaction in the general population; e.g., no. 11, age at time of Schick test. This study was designed to minimize the influence of attributes not pertinent to the questions propounded. For the vast majority of children the age spread at time of the Schick test was less than fourteen months, and thus no significant age correlation was to be expected.

Table 5.-- *Results of Schick Test by Duration of Breast Feeding After Adjusting for Influence of Other Attributes*

Schick negative	373	374.9	391	389.1	764	Chi Square =4.6700
Total	425		424		849	"P" = .031

Similar tables were prepared to determine whether the age at last dose, the presence of other children less than 10 years old in the household, the product received the number of doses received influenced the Schick reaction after adjusting for each of the other three attributes. The adjustment did not alter the significance of any of these attributes. Each was then checked against all other attributes listed in table 4, and the observed differences were remarkably consistent so far as the small numbers would permit comparison. Thus it is evident that only four of the attributes observed are significantly correlated with the Schick reaction in this study and that each of these four is independently significant after taking account of all other attributes: 1. Children receiving two doses of either product had disproportionately fewer Schick positive reactions than children receiving only one dose of the same product. 2. Children receiving their second dose of either product at 6 to 23 months of age had disproportionately fewer Schick positive reactions than children receiving their second dose of the same product at 2 to 5 months of age. 3. Children receiving the mixed product had disproportionately fewer Schick positive reactions than children receiving the unmixed product. After adjusting for the combined influence of significant attributes the ratio of the percentage of Schick positive reactions among children receiving the mixed as compared with those receiving the unmixed product was 1:3. 4. Children living in single child households had disproportionately fewer Schick positive reactions than children living in households with other children less than 10 years of age.[13]

To the foregoing observations an over-all consideration should be added. In the absence of artificial immunization few children 6 to 30 months of age are immune to diphtheria, whereas adults for the most part are immune. In this study a total of 1,025 children of median age 18 months were given Schick tests one year after they were given only one or two doses of the mixed or unmixed study products, and 90.6 per cent were found immune, whereas of the 707 mothers given Schick tests 82.3 per cent were found immune, as measured by the Schick test. Thus the over-all effort to immunize at a young age was highly successful. With respect to the age of immunization and the products given it should be noted that although children 2 to 5 months of age were not immunized as well as children 6 to 23 months of age, as indicated by the Schick test, the mixed product was so superior to the unmixed product that it appeared to be a better immunizing agent at the young age than the unmixed product at any age. Actually 8 per cent (15 out of 201) of the children who received both doses of the mixed product at 2 to 5 months of age had Schick positive reactions, as compared with 11 per cent (19 out of 175) of the children who received both doses of the unmixed product at 6 to 23 months of age.

---

[13] This observation would appear to be incompatible with existing theories on the natural acquisition of diphtheria immunity. It is receiving further study.

SUMMARY AND CONCLUSIONS

A method has been described for designing and carrying out a fully controlled clinical trial of a prophylactic agent for immunizing young children in the general population against diphtheria.

The routine use of an alum-precipitated mixture of diphtheria toxoid and pertussis vaccine as prepared for this study and given in two doses with a four-week interval between doses to young children in Norfolk, Va., and a similar community, not only should result in a better protection against diphtheria, as measured by the Schick test, than that which would result from the similar use of ordinary unmixed alum-precipitated diphtheria toxoid but also should be effective for diphtheria immunization when given to infants 2 to 5 months of age.

The use of a Schick test performed one year after *immunization as an index of diphtheria* immunity revealed:

1. Children who received two doses of the unmixed alum-precipitated diphtheria toxoid had three times as many failures to immunize against diphtheria as children who received two doses of the alum-precipitated mixture of diphtheria toxoid and pertussis vaccine. Children who received only one dose of these products exhibited a similar difference.
2. Children who received only one dose had three times as many failures to immunize against diphtheria as children who received two doses. This was true no matter which product was given.
3. Children who received both doses at 2 to 5 months of age had twice as many failures to immunize against diphtheria as children who received at least one of their doses at 6 to 23 months of age. This was true no matter which product was given.
4. Children who received two doses of the mixed product before they were 6 months of age had fewer failures to immunize against diphtheria than children receiving the ordinary unmixed product at any age from 2 to 23 months.

ABSTRACT OF DISCUSSION

Dr. Harold B. Wood, Harrisburg, Pa.: These laborious investigations are worth while, and the investigators deserve thanks from everybody. In the immunization of children there is a question of to what extent Schick testing should be done. Frequently city or state organizations have certain amounts appropriated for such work. Is it worth while to give Schick tests to those children who have received their immunizing doses? I do not think so. Where the appropriation is limited, it is much better, to consider that a certain percentage are immunized already from their first series of doses, and use the rest of the money to immunize more children, rather than to go back and pick the Schick test for those children who have already received their immunizing doses. That is the problem we are up against frequently, and it is better, I believe, to carry on that plan. The new toxoid toxin-antitoxin which Dr. Ross explained seems to be an advantage because, if there is one thing we need in the Schick testing, it is a better way to determine definitely what is positive and what is negative. It is much easier to get children and their parents out for the immunizing doses than it is for the Schick retesting to determine the definite positive and what is negative. It is much easier to get children and their parents out for the im- much easier to get children and their parents out for the immunizing doses than it is for the Schick retesting to determine *the definite positive immunity granted; therefore, why bother* with that in general work? Of course, these remarks have no reference whatsoever to children in institutions which are under definite, lengthy control. Reprints of papers like these should always go into the library of the Hygienic Laboratory and also to the principal state authorities, if the authors are willing to send them.

Dr. Maxwell Stillerman, Great Neck, Long Island, N. Y.: What was the incidence of sterile abscess reactions in your series?

Dr. James P. Leake, Washington, D. C.: May I remark that my associates and I think the preferable term is "cyst" and not "sterile abscess." They are not sterile abscesses but little cysts, which tend to absorb themselves.

Dr. Joseph A. Bell, Bethesda, Md.: The mixed product as prepared and used in this study at 2 to 5 months of age was a better immunizing agent, that is, produced disproportionately fewer Schick positive reactions, than the unmixed product given at any age from 2 to 23 months. However, neither the mixed nor the unmixed product immunized as well when given at 2 to 5 months of age as when given at 6 to 23 months of age. Table 4, attribute 12, shows the number of Schick positive reactions by age at time of injection. There was no significant association between the mothers' and children's Schick reaction in this study. The mothers were given Schick tests not only to give evidence with respect to the potency of the Schick toxin but also because it was considered possible that some association between the mothers' and children's Schick reaction would occur. If the children had been given Schick tests when less than 6 months of age and if they had received no diphtheria toxoid prior to the Schick test, some association between the mothers' and children's Schick reaction might have been evident. In this study all the children received diphtheria toxoid one year prior to the Schick test. With respect to Dr. Stillerman's question, the local and general reactions resulting from the use of the mixed and unmixed products in this study were so few and insignificant that to date no tabulations of their occurrence have been made. The Health Department personnel who administered the study products were instructed to use a different needle for each injection and to inject the products deeply into the loose subcutaneous tissue. I do not know whether the lack of reactions was the result of the method of injection or the small number of H. pertussis organisms injected with the mixed product, or whether it was due to other factors.

Whales.—Since the period of gestation is stated to be just over ten months for blue whales and eleven and a half months for fin whales, and the addition of the suckling period of six or seven months gives a total of about eighteen month from conception before the calf can fend for itself, it is obvious that the legal size limit has been fixed too low to be effective in preserving the stock Hamilton, J. E., *Nature*, June 12, 1948.

CESAREAN HYSTERECTOMY AT THE CHICAGO LYING-IN HOSPITAL

W. J. DIECKMANN, M. D.
FLOYD J. BJORK, M. D.
and
GLORIA T. ARAGON, M. D.
Chicago

The mortality for cesarean hysterectomy at this hospital was reported[1] in 1945 to be 1.04 per cent and for cesarean section to be 0.61 per cent. Ninety-six cesarean hysterectomies with 1 death were mentioned in the report, and the statement was made that hysterectomy is the operation of choice in infected or potentially infected patients. There have been reports from several clinics advocating extraperitoneal section instead of cesarean hysterectomy in the treatment of infected or potentially infected patients. Cosgrove and Waters,[2] reporting from the Margaret Hague Hospital, had the largest series of extraperitoneal sections and had excellent results in the type of case under discussion. They maintained that hysterectomy in such seriously ill patients is a formidable procedure and its immediate mortality must be high. They pointed out that of the 96 cesarean hysterectomies reported by Dieckmann not all were performed for infection but some were undoubtedly elective operations. This report is an analysis of our indications for the hysterectomies and of the complications and an explanation as to why the removal of the uterus, if properly carried out, will have the lowest mortality in infected patients.

A collective review by Dieckmann in 1945 of deaths after cesarean section showed that the average mortality in maternity hospitals was 1.46 per cent and that almost half of the deaths were due to infection, peritonitis being the chief cause of death. The average mortality for cesarean hysterectomy in four maternity hospitals was 4.3 per cent, with a range of 1 to 14 per cent. Cosgrove and Waters stated that 6 deaths following cesarean section for disproportion were due to peritonitis. Two years ago they reported[2] 483 extraperitoneal sections with 6 maternal deaths (5 due to infection), a mortality rate of 1.24 per cent. Since most of their operations were performed in infected or potentially infected patients (whom we would have delivered vaginally, if necessary by craniotomy, or by cesarean hysterectomy), this low mortality convinced us that this type of operation in the potentially infected patient is far superior to laparotrachelotomy and to difficult vaginal deliveries with their high fetal mortality and maternal injuries, but has not convinced us that it is safer than cesarean hysterectomy in infected patients.

One of us (W.J.D.) has seen autopsies after 8 cesarean sections, 3 after laparotrachelotomy and 5 after classic cesarean section, and in each instance the sutures were not holding and lochia and pus were draining into the abdominal cavity. We believe that in infected patients the abdomen is able to take care of the ordinary amount of spill, but if the postpartum uterus, which is an excellent nidus, is not removed it acts as a focus for continued dissemination of bacteria into the abdominal cavity and into the blood and lymphatic systems. However, if the entire uterus is not removed in the infected patient or at least down to within 2 cm. of the external os, not only is the safety of the operation lost but the added manipulation plus the remaining traumatized uterus adds to the danger. We are not concerned about the peritoneal contamination from buttonholing the peritoneum during an extraperitoneal section but are concerned with the damaged area of peritoneum, no matter how ligated, as being the place for infected uterine contents to gain access to the abdomen.

Cosgrove and Waters have questioned the value that we attribute to Baldwin's treatment of puerperal infection by early hysterectomy. Seventy-seven per cent of Baldwin's[3] patients had pus in the uterine wall or in the tissues around the uterus at the time of the operation, and we think that the mortality without the hysterectomy would have been close to 100 per cent. He had 30 per cent mortality in his first 67 cases, 18 per cent in his next 17 and no deaths in the following 6. We can recall autopsies in which the infection was localized in a small area in the puerperal uterus, in which, had it been removed early enough, the outcome might have been different. We can also recall patients who had a cesarean hysterectomy for infection, either potential or actual, who were extremely ill for weeks and who, we believe, would have died had the uterus not been removed.

DATA ON CESAREAN SECTION AND HYSTERECTOMY

We do not propose to make extensive citations from the literature; however, Harris'[4] study is especially pertinent. His report in 1922 of 64 cesarean hysterectomies performed at Johns Hopkins Hospital with 3 deaths, a mortality of 4.7 per cent, corrected 1.6 per cent, with no deaths from infection, demonstrates what could be done before the days of blood transfusions and antibiotics. The policy at Johns Hopkins Hospital was to remove the uterus in patients who were hopelessly deformed or mentally defective at the time of the third cesarean section or if there was

evidence of infection. Of 27 patients who were operated on before or early in labor, histologic evidence of infection was found in only 1. There was clinical evidence of infection in 18 of the 28 patients who had been in labor for a long time or on whom attempts at induction or delivery had been made, and 23 of these uteri showed histologic evidence of infection. Harris concluded that cesarean hysterectomy is the operation of choice in patients who are potentially infected.

A review of the literature does make one wonder about the relatively low incidence, 0.2 to 2 per cent, of cesarean hysterectomy. For example, De Normandie[5] in his five year study of 11,030 cesarean sections in Massachusetts reported that there were only 147 hysterectomies, 1.3 per cent, with a mortality of 9.5 per cent.

Irving[6] in 1945 stated that in the preceding ten years at the Boston Lying-in Hospital there were only 32 cesarean hysterectomies.

Reis and De Costa[7] in a recent article reviewed the history of cesarean hysterectomy and in the United States collected 25,028 cesarean sections and only 636 hysterectomies, an incidence for the latter of 2.5 per cent and a mortality of 5.2 per cent. The incidence and mortality in their own series were 4.5 and 0 per cent, respectively. The morbidity was 39 per cent, which they stated was much less than what they found after cesarean section. Reis and De Costa attributed the reduced morbidity to the fact that hysterectomy removes the potentially infected thrombotic placental site and to the substitution of a short incision with opportunity for spontaneous drainage for the longer buried uterine incision.

TABLE 1.—*Cesarean Section and Hysterectomy at the Chicago Lying-In Hospital*

Years		Deliveries	Cesarean Section		Maternal Mortality		Cesarean Hysterectomy		Maternal Mortality	
			No.	%	No.	%	No.	%	No.	%

1941-1947	(5½)	19,628	987	5.0	1	0.10	77	7.8	0	0.0
1931-1947	(15½)	46,949	2,444	5.2	10	0.41	153	6.3	1	0.65
1918-1947	(27½)	81,756	3,654	4.5	30	0.82	190	5.2	2	1.05

We are excluding hysterectomies in cases in which the uterus ruptured before delivery. There have almost always been hemorrhage and shock, excessive spill of infected amniotic fluid and meconium into the abdominal cavity; torn arteries have retracted; extensive tissue spaces have been opened, and there are frequent injuries to bladder and ureter and occasional injuries to the sigmoid. Our mortality in these patients is 23 per cent. Patients with separations of the old scar found at the time of the cesarean section without any escape of uterine content, are included.

The data pertinent to cesarean section and hysterectomy on our service are listed in table 1. There were 168 operations since 1931, but only 153 were performed on patients who were thirty weeks or more pregnant. There was only 1 death. This constantly increasing use of cesarean hysterectomy may be due to the fact that the department is a combined one, the staff being experienced both in obstetrics and gynecology. The operation is performed with equal frequency in both private and clinic patients, with perhaps a slightly higher incidence in the former. If one believes, as we do, that elective cesarean hysterectomy has less mortality than elective cesarean section, and if one is properly appreciative of the uterine diseases that occur with increasing frequency after 35 years of age, it is obvious why we *favor hysterectomy in this group of* patients instead of tubal ligation.

METHOD

We have never regarded cesarean hysterectomy as a formidable procedure. It is more difficult than removal of the nonpregnant uterus, because of the size of the organ and because of the dilatation in the lower segment and cervix. Each resident who completes his training on our service is first assistant at a number of these operations and always performs several during his service.

One of us (W.J.D.) pointed out in his paper on cesarean section that this operation should not be used as a last resort. There is a proper time for the performance of safe cesarean section. This, too, is true for cesarean hysterectomy. It should not be performed in the moribund patient with the hope of saving her life.

If the indication for the hysterectomy is potential or actual infection of the uterus, it is necessary that spill be kept at a minimum, but most important is the complete removal of the uterine tissue. The transverse incision must be below the level of the internal os if there is no cervical effacement at, or within 2 cm. of, the external os if there is a lower uterine segment. The need for complete or almost complete removal of the uterus is evident from the figure. After labor the lower segment is 10 to 15 cm. in length, and if not removed it will have almost as great potentialities for infection, because of the operation, as the entire uterus. If the hysterectomy is performed to prevent future pregnancy in a woman of 30 or less, it is desirable to leave enough uterus in order that the patient will have regular, but extremely brief, and scanty menstrual periods. The transverse incision here is made at, or slightly above, the lower segment of the uterus, or 7 to 10 cm. from the external os, or, if there is no cervical effacement, 2 cm. above the internal os. The average weight of the term uterus is 997 Gm., with a range of 828 to 1,118 Gm. The cuff is closed in layers, interrupted surgical gut sutures being used if there is infection, and completely peritonized with the

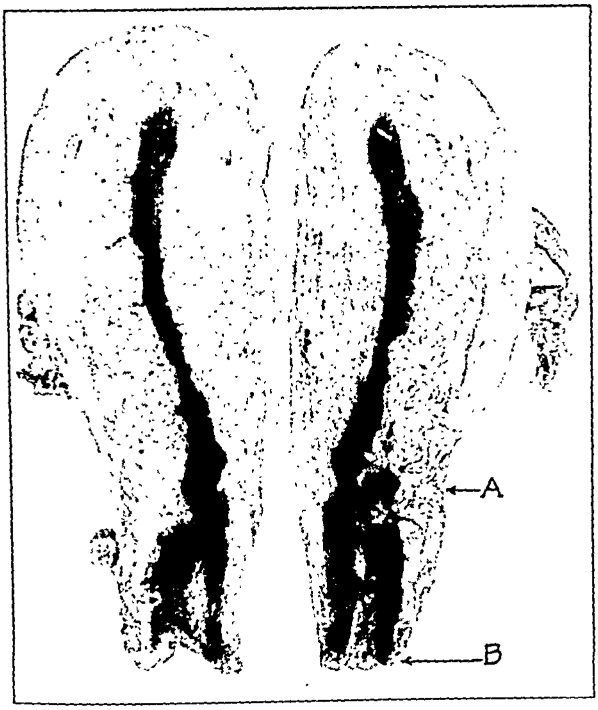
bladder flap. No drainage is used. If there is potential or actual uterine infection, the patient is given nothing by mouth and is given fluids parenterally until the clinical course warrants the oral administration. The water and salt balance must be adjusted to insure a urine output of at least 1,000 cc. per twenty-four hours. The patient with clinical evidence of infection should be given adequate amounts of blood, the appropriate vitamins and sulfonamide compound and/or appropriate antibiotics, although our results to date without the latter drugs have been excellent. The noninfected patient should have the usual postcesarean routine.



Term uterus removed at autopsy twenty-four hours after delivery. It weighed 1,002 Gm. and was 24 cm. in length. The lower segment *A* to *B* measured 9 cm. *A* indicates beginning of contractile portion (corpus) of uterus, *B* the external os. In an infected or potentially infected uterus the transverse incision must be made at or within 2 cm. of *B*. If it is desirable for the patient to have menstrual periods the transverse incision must be made at or slightly above *A*.

INDICATIONS FOR CESAREAN HYSTERECTOMY

The indications for the hysterectomy are listed in table 2. Many of the indications for the cesarean section were repeat operations, but, if myomas were found in the uterus, our policy was to remove it instead of crushing and ligating the tubes. If the patient was 35 years or over and a multipara, we frequently prevented future pregnancies by hysterectomy. A Couvelaire uterus in a multipara, even if there was no bleeding, was always removed, but if it was in a primipara every attempt was made to save the uterus unless there was evidence of pronounced lack of muscle tone or hemorrhage. Elderly multiparas with placenta previa usually had the uterus removed instead of a tubal ligation. The high incidence of placenta accreta in the patients with previa is of interest. The uterus was removed in a number of cases after unsuccessful tubal ligation, primarily for the purpose of studying the tube which was still patent. By diseased organ we mean a uterus in which there are two or more cesarean scars. There were 5 patients in whom, at the time of the cesarean section, the membranes projected through the scar after the vesical peritoneum was reflected or the scar tissue was paper thin. Two patients had an extensive ventral hernia and, since tubal ligation was advisable, it was felt that the postpartum course would be smoother with a hysterectomy. Three patients at the time of the cesarean section had more than the usual hemorrhage from the uterus, which did not respond properly to injections of solution of posterior pituitary, massage and packing. Four patients had carcinoma of the cervix, which had been treated with radium in 3 (total hysterectomy in these) and by subtotal hysterectomy in 1, who subsequently received radium. The indications in the miscellaneous group were acute appendicitis and rupture, stenosis of the vagina, a carcinoma of the breast (castration), a myoma with sarcomatous degeneration and a psychiatric case.

* Total hysterectomy was done in 1 case.

† Total hysterectomy was done in 3 cases.

A unilateral salpingo-oophorectomy was performed in 31 cases and a bilateral salpingo-oophorectomy in 8 cases.

The age and parity of our patients are given in table 3. Over two thirds of the patients were 30 years of age or older, and over two thirds had two or more children. If a tube and an ovary are left on the same side and care is taken not to interfere with the venous return from the ovary and tube, there is no menopause within two or three years, as has been reported, unless it would have occurred normally. We know that ovarian function has lasted for over ten years in some of these patients, provided that the operation was performed in patients less than 30 years of age.

The following abstracts give the indications for the hysterectomy in the 5 patients who were less than 25 years old:

A.K., aged 24 years, was a gravida IV, para II. The diseased organ—that is, two previous scars in the uterus—was the indication for the hysterectomy.

C.S., aged 24 years, gravida II, para I, had a total hysterectomy because of a diagnosis of adenocarcinoma of the cervix, which subsequently was changed to pronounced hyperplasia of the cervical mucosa due to pregnancy.

J.L., aged 24 years, gravida II, had a hysterectomy because at the time of the operation a complete separation of the old cesarean scar was found.

I.B., aged 24 years, gravida II, had had a previous cesarean section. The uterus was removed because the patient had had ruptured membranes for twenty-four hours and an unsterile vaginal examination in the clinic.

M.N., aged 19 years, gravida III, had had two previous cesarean sections. The membranes had been positively ruptured for one week and the patient had been in labor for seven hours. No sulfonamide drug or penicillin was used. The postoperative course was normal.

MORBIDITY AND DURATION OF FEVER

The morbidity and duration of fever are given in table 4. The potentially infected patients are those in labor and/or with ruptured membranes of more than twenty-four hours' duration. The following are our criteria for an infected patient, and in cases of cephalopelvic dystocia we would deliver either by craniotomy or, preferably, by cesarean hysterectomy: (1) labor and/or ruptured membranes of forty-eight hours or more associated with: (*a*) temperature of 38 C. (100.4 F.) or more, (*b*) chills, (*c*) positive blood culture and (*d*) bacteria in the amniotic fluid in large numbers; (2) repeated vaginal examinations with hands or unsterile gloves; (3) foul-smelling amniotic fluid; (4) labor after attempts at delivery; (5) when a bag, bougie or pack has been in the uterus; (6) more than twelve rectal or six vaginal examinations.

It is difficult to believe that in a period of fifteen and one-half years there were only 12 potentially infected and 21 infected patients out of a total of 153 in whom we deemed hysterectomy advisable. Irrespective of how carefully records are kept, they do not express the real indications to the degree experienced by the surgeon at the time of the operation. One of us (W.J.D.) has noticed this frequently in studying the indications for terminating pregnancy in patients with toxemia. He could recall just how serious the patient's condition was, and yet the record does not support his memory of the case. The morbidity is 50 per cent in the clean and potentially infected patients and 71 per cent in the infected. There is not much difference between the clean and the potentially infected. The interesting thing is the average short duration of the fever.

TABLE 4.—*Morbidity and Duration of Fever*

Type of Cases	Normal	38 - 38.9 C.*	39 - 39.9 C.†	40 C.+‡	Total
Clean Cases	59 - 49.0%	47 - 39.0%	10 - 8.0%	4 - 3.0%	120
Potentially Infected	6 - 50.0%	4 - 33.0%	2 - 17.0%	0	12

MAJOR COMPLICATIONS

We have listed the major complications in table 5. One patient who had Streptococcus viridans septicemia from acute endocarditis required a second cesarean section. A hysterectomy was performed in order that a potential implant site could be eliminated. The postoperative course was normal.

Two patients had paralytic ileus, presumably without peritonitis. Six patients had peritonitis, although the characteristic symptoms and signs of peritonitis were absent. One of us (W.J.D.) has taught for many years that the classic symptoms and signs of peritonitis—namely, pain, persistent vomiting and abdominal rigidity—are rarely, if ever, present in puerperal peritonitis.[8] The characteristic findings are some abdominal distention, little, if any, vomiting, an indefinite mass arising from the pelvis and varying elevations of the temperature with a pulse rate which is more rapid than the fever would warrant. Frequently there are signs of bronchopneumonia, especially at the bases of the lungs, due to the splinting of the diaphragm. These findings were also noted by Rivett[9] and his co-workers in

TABLE 5.—*Complications*

	No. of Cases
Septicemia	1
Peritonitis	6
Paralytic ileus	2
Pelvic thrombophlebitis	1
Pelvic abscess	1
Pulmonary embolism	1
Infection of respiratory tract	3
Hemorrhage from cervical stump	2
Infection of abdominal wound	3
Infection of urinary tract	3
Bladder injury	2*
Ligation, both ureters	2†

* There was one vesicovaginal fistula.
† Subsequent unilateral nephrectomy was done in each case.

[9] Rivett, L. C., Williams, L.; Colebrook, M. B., and Fry, R. M.: Proc. Roy. Soc. Med. 26:45, 1933.

1933, who stated that there was no clinical syndrome which could be stated as being diagnostic of puerperal peritonitis. Rigidity was hardly ever present and constipation rarely. In a group of 30 fatal cases in which the diagnosis was confirmed by autopsy, they noted distention in 22, tenderness in 13, rigidity in 4, diarrhea in 4 and vomiting in only 5. These observations have been confirmed on our service by either laparotomy or autopsy.

One patient had pelvic thrombophlebitis and one a pelvic abscess which was drained some six weeks after operation. A number of patients had slight infections of the respiratory tract, and 3 had serious infections. Hemorrhage from the cervical stump occurred in 2 patients on the tenth day; this was treated by clamping and removing the clamp in forty-eight hours. Neither patient required a transfusion. Injury to the bladder occurred in 2 patients, in 1 of whom a vesicovaginal fistula developed which required subsequent repair.

A serious complication was the ligation of both ureters in 2 patients. A total hysterectomy was perfromed in a case of placenta previa to obtain the entire specimen. The other patient had a carcinoma of the cervix, and a rather extensive resection of the parametria and vagina was made. However, in both instances the patient was given 500 cc. of 30 per cent dextrose, and when no urine appeared in the bladder within thirty minutes we felt that the diagnosis was definite. It was confirmed by inability on the part of the urologist to pass catheters in either ureter. The usual treatment in such cases is a nephrostomy. The abdomen was reopened, and, with the urologist passing ureteral catheters from below and the surgeon locating the point of obstruction through the abdomen, the constricting sutures were located and cut. In 1 patient a ureterovaginal fistula developed, which required a subsequent nephrectomy, and in the other case one ureter was implanted in the bladder wall and the other ureter was implanted in the skin, the kidney being removed subsequently.

There were 10 stillbirths and 8 neonatal deaths, a total uncorrected fetal mortality of 11.8 per cent, which is twice that for cesarean section and four times that for all types of delivery. Abruptio placentae, placenta previa and prolonged labor are all characterized by a high fetal mortality and comprise one third of the series.

The 1 patient who died, M.S., was 32 years old, gravida X, para VI and who weighed 108 Kg. She had had two previous deliveries by us; she had diabetes and chronic rheumatic heart disease, and late in pregnancy toxemia developed. She was at term on Oct. 29, 1937, and was not cooperative. She was admitted on October 3, at thirty-seven weeks' gestation, because her membranes ruptured. On October 4 the attending obstetrician advised observation and no induction; shortly thereafter the patient began having contractions. There had been two sterile vaginal examinations, and, because of twenty-one hours of labor with strong tumultuous pain for six hours, ruptured membranes for over twenty-three hours and an extremely large abdomen, a cesarean hysterectomy was performed. The baby weighed 5,170 Gm., and the placenta weighed 885 Gm., thus accounting for the huge size of the abdomen. On the second postoperative day the patient complained of abdominal distention, but was taking fluids by mouth. On the third there was increasing distention and she vomited once. Wangensteen drainage was instituted on the third. On the fourth day the patient was given water and the tube was removed. The tube was inserted on the fifth and later removed. The same procedures occurred on the sixth day. The tube was reinserted on the seventh, removed on the eighth and again reinserted on the ninth. The patient died on the tenth postoperative day. There was a difference of opinion, and one obstetrician would order the patient to have fluids and food by mouth and another one would discontinue them. Most of the staff thought that the patient at first had localized peritonitis and that had she been given the routine treatment for peritonitis the outcome might have been different. The fact that she lived ten days would seem to substantiate this belief.

The essential findings at the autopsy were as follows: When the peritoneal cavity was opened, the markedly distended domelike abdominal wall suddenly collapsed as a rush of gas was released. The abdominal cavity contained 2,200 cc. of a foul-smelling, turbid tan pus, which was found in all parts of the peritoneal cavity from the diaphragm to the pelvis, partly concealed in pockets between the viscera and the abdominal walls. After removal of the fluid, the peritoneal surfaces, both visceral and parietal, showed focal injection and were covered with a fibrinous or fibrinopurulent exudate. The omentum adhered to the region of the cecum by fibrous adhesions. The omentum was greatly thickened and inflamed, apparently through the entire fat layer. The stomach was distended with gas. The large bowel was greatly distended by gas and a semifluid content. Behind the region in the cervical stump was a transverse row of surgical gut sutures, peritonizing the cervical stump. The exudate was no thicker here than on other parts of the peritoneum. There also was pus in the lesser peritoneal cavity. Other findings were: bilateral ovarian hemorrhagic infarction, thrombosis of the right ovarian vein, pronounced dilatation of the cervical canal, active rheumatic myocarditis and clinical diabetes mellitus.

One of us (W.J.D.) has had seriously sick patients after cesarean section and after cesarean hysterectomy. He had 1 patient die after hysterectomy. This patient was brought into the hospital in 1926 with a myoma blocking the inlet and a nonpulsating cord which had been hanging through the introitus for three days. The uterus was removed without being opened. The pulse and temperature remained normal until the day of death, which occurred on the seventh postoperative day. Generalized peritonitis was found at autopsy.

CONCLUSIONS

Cesarean hysterectomy has absolute as well as relative indications. It is not a panacea for poor obstetrics. The incidence necessary for proper training in the technic is too low in most clinics.

It requires about the same amount of time for the experienced operator to perform cesarean hysterectomy as for laparotrachelotomy.

The blood loss is not increased and is usually reduced.

Hysterectomy after cesarean section in infected or potentially infected patients insures the lowest mortality, provided that the entire body or corpus and most of the cervix is removed. Peritonitis routine is necessary for forty-eight to ninety-six hours or until the patient's condition warrants oral fluids. During this period adequate supportive treatment is necessary and sufficient parenteral fluid must be given to insure a urinary output of at least 1,000 cc.

Cesarean hysterectomy in the treatment of the infected patient—whether the infection is due to cephalopelvic disproportion, to obstruction from tumors, fetal malposition, unsterile examinations or a faulty mechanism of labor—should have a mortality of less than 2 per cent.

If it is an elective operation, the mortality should be less than 1 per cent.

ABSTRACT OF DISCUSSION

DR. ARTHUR B. HUNT, Rochester, Minn.: Five alternatives present themselves when the problem of actual or potential infection in the presence of prolonged dystocia is considered. They are (1) the avoidance of getting into such a situation—that is, prophylaxis, (2) cesarean hysterectomy, (3) extraperitoneal cesarean section, (4) low cervical cesarean section, with full use of sulfonamide compounds and antibiotic substances, and (5) craniotomy. Dr. Dieckmann, in his 1945 communication on cesarean section, emphasized the importance of early decision in the disposition of patients with dystocia in obtaining a low mortality rate, and we cannot too greatly appreciate the importance of early decision in practice and in the training of postgraduate students. The value of cesarean hysterectomy is well outlined in his present communication. I would agree with Dr. Dieckmann that in the presence of actual infection such a procedure is the one of choice. We feel that cesarean hysterectomy is preferable to multiple myomectomy in the presence of fibroids and is at times for intractable hemorrhage. We have placed a rather heavy strain on both the low cervical cesarean section and the concomitant use of sulfonamide compounds and antibiotic materials in these cases, but to date with good results. The frequent ill advised use of antibiotic substances and the too general ready dependence on them can well be deplored, but this has little connection with the early intensive and persistently skilful use of such preparations when they are urgently needed. At the Mayo Clinic, we have done 310 cesarean sections in about 9,500 deliveries from Jan. 1, 1935 to June 1, 1947; the incidence of cesarean section has been 3.3 per cent. Twelve patients had cesarean hysterectomy, making an incidence of 3.9 per cent among the cases of cesarean section. Not included in this group is 1 instance of posthumous cesarean section, done after death from a brain abscess. There was no maternal mortality in the 310 cases. Surprisingly, only 1 patient was subjected to Porro cesarean section because of actual or potential infection, and this patient was operated on less than two months ago. We have frequently violated Dr. Dieckmann's rule by applying low cervical cesarean section with the use of antibiotic substances in many cases. In an even larger number, by these means, we eventually delivered normal live infants through the pelvis and left patients in good condition for further reproduction, whereas if we had performed cesarean hysterectomy we would, of course, have deprived them of the uterus. However, we would agree that in the presence of definite infection, which makes the risk seem high, cesarean hysterectomy is the operation of choice, since it affords a good prognosis for the fetus and, as Dr. Dieckmann has so wisely observed elsewhere, it is better to have a live woman without her uterus than a dead woman with it. One of his tables reveals a mortality rate of less than 0.1 per cent, there being only 1 maternal death in more than 1,050 cases of cesarean section of all types in a five and a half year period. These results speak for themselves and probably represent a bedrock level in maternal mortality associated with cesarean section.

DR. JAMES F. NORTON, Jersey City, N. J.: Dr. Dieckmann, you are in error when you credit us with 6 deaths, 5 of them from infection. Four of our 6 deaths were from infection, 1 was from hemorrhage and 1 was from spinal anesthesia. We have not had a death due to infection following extraperitoneal cesarean section since 1940, and it goes back almost to the 120 or 130 cases in this series of 753. You stated, and I think justly so, that we are all interested in doing what is best for the patient to reduce fetal and maternal mortality, and do it with a degree of safety. We believe definitely that we have, with the method we use, a method at our disposal which is quite safe, which is well within the surgical competence of any trained man, and you admit that you have difficulty getting material to teach cesarean hysterectomy to your group. In your statistical report you mentioned 2 bladder injuries. About a year ago I submitted a paper setting forth a paravesical extraperitoneal cesarean section technic, Lascoe approach, and I stressed then the ease of performance of the operation, the almost foolproof postoperative course. In the light of our subsequent experience, I have reason to believe only that what I said then was probably a gross understatement. This is definitely a different operation from that supervesical operation described by Waters. It is a paravesical extraperitoneal cesarean section, as I said, a modified Lascoe, but rather definitely modified.

DR. WILLIAM F. MENGERT, Dallas, Texas: From a theoretical point of view, it seems, since the portal of entry of puerperal infection is through the endometrium, that if the uterus is removed before there is a spreading infection one can do a great deal toward prevention of death from peritonitis. It does not make much difference what sort of hysterectomy is done if one needs to do one. My associates and I happen to do total hysterectomy, in the few cases which we do. It is my intention to support Dr. Dieckmann in this, but I nevertheless must comment on the incidence of cesarean section in his paper, not only there but also at Jersey City. It is difficult for me to believe that 1 in 25 women in Chicago and in Jersey City is unable to give birth to a baby by the vagina. Since at Parkland Hospital we tend to permit vaginal delivery and do relatively few cesarean sections, I have no such figures to present as you have heard here today, but I do want to present a case report in order to illustrate the fact that extraperitoneal cesarean section is not without danger. A young primigravida was admitted in an obstructed labor with cephalopelvic disproportion. After about forty-eight hours, when she had a temperature of 99.5 F. (this fever did not subside with the administration of fluids), we did a Waters extraperitoneal cesarean section. Both at operation and at autopsy it was demonstrated that the peritoneum had not been injured. It was intact at the time of operation. It was also intact at the time of autopsy. Nevertheless, this woman died with right-sided pyelonephritis and a localized peritonitis. She had all of the antibiotics and all of the sulfonamide drugs that we were able to give her. I should like to put on the record this fact, that it is possible for peritonitis to occur through an intact peritoneum.

DR. W. J. DIECKMANN, Chicago: Dr. Hunt spoke of the use of antibiotics and sulfonamide drugs in cases of prolonged labor. Since over two thirds of the cases of puerperal infection are due to bacteria which are not amenable to either substance, I do not believe that one is justified in taking chances with the patient's life. These drugs should be given and in cases with infection the uterus should be removed and bacteriologic and histologic studies made of the uterus to determine whether these drugs have been of any value. I know 2 cases in which craniotomy was performed on the living baby. In both instances the baby had been damaged either by prolonged labor or attempts at delivery. One must remember that after prolonged labor, even though the fetal heart sounds are within the normal range, it does not necessarily follow that the baby will be born alive or that it will, if born alive, be well. Dr. Norton questioned hysterectomy in patients less than 30. We felt that the hysterectomy was indicated in each case and, as long as an ovary and tube are left on the same side, the patient will not have her menopause for at least ten years and probably longer. We see no need to preserve the uterus when there is a chance that it may endanger the patient's life. Since the cervix in most of these cases has been normal during pregnancy we see no reason to remove the external os. We have used the extraperitoneal cesarean section in some elective and also in some borderline cases, but have not been able to deliver the baby within eight minutes, as suggested by Dr. Norton with his modifications. One operator had the case with a bilateral ligation of the ureters and also the case with vesical injury in which there was subsequently a vesicovaginal fistula. I am sorry if I have misquoted, giving 5 deaths from infection in place of 4. That was according to the information that I had. Dr. Mengert questioned the 4 per cent incidence of cesarean section. I know that we perform a few too many sections, and in all probability the group at Margaret Hague Maternity Hospital have the same experience. However, our mortality and morbidity are so low that we believe that we are justified in our practice. Our results are certainly better than they were fifteen years ago, when we were attempting to have a lower incidence. The number of maternal lacerations with extensive scar tissue in the vagina was definitely increased.

Dr. Garden and the Gardenia.—Those amateurs who were able successfully to apply the Linnaean principles of classification were encouraged by the great Swedish botanist to send to Upsala accounts of all flora and fauna believed to be "nondescript." Alexander Garden, a physician of Charleston, South Carolina, was numbered among the so-called "sons of Linnaeus." In 1760 Linnaeus named a certain genus of plants Gardenia in his honor, and in later years Garden sent his master so many specimens of various kinds that Linnaeus called him "the happy illustrator of Nature in his own region of Carolina."—Denny, Margaret, *The Scientific Monthly,* July 1948.

PATHOLOGIC NON-NEOPLASTIC INTRACRANIAL CALCIFICATION

JOHN D. CAMP, M. D.
Rochester, Minn.

Ström[1] in 1919 conveniently divided intracranial calcification as revealed by roentgenograms into two groups: the physiologic and the pathologic. The former group includes structures such as the pineal gland, choroid plexus, falx cerebri and pacchionian bodies which normally may exhibit varying amounts of calcium. The pathologic group includes all tumors and certain non-neoplastic lesions. Many of the latter produce clinical signs which simulate those of a cerebral neoplasm, and in the differential diagnosis roentgenographic evidence can play a most important role. Not infrequently the roentgenologist not only can exclude the presence of a tumor but by virtue of the shape, extent and distribution of shadows of calcification can predict the nature of the disease and often the cause. The table shows a practical classification of these lesions for the roentgenologist. The pathologist may disagree with such a grouping because, microscopically, the method of deposition of calcium is similar in many of these lesions; nevertheless, the gross arrangement of the deposits of calcium as revealed by roentgenograms is typical for many.

VASCULAR LESIONS

The vascular intracranial lesions (non-neoplastic) that may be portrayed by calcification in the roentgenogram are arteriosclerosis, aneurysms, angiomatous malformations and hematomas.

Arteriosclerosis.—Arteriosclerosis involving especially the internal carotid artery is evident in about 1.8 per cent of all roentgenograms of the skull. The incidence varies naturally with age; it ranges from 4.2 per cent in the sixth decade to 10 per cent in the eighth decade. The degree of calcification varies from the simple calcified plaque seen edgewise or *en face* just lateral to the sella turcica to complete tubular calcification of the cavernous and intracranial portions of one or both internal carotid arteries. The simple arteriosclerotic artery does not usually rise above the interclinoid level in the cavernous sinus, and the constancy of this position is important in distinguishing arteriosclerotic calcification from calcified aneurysms and calcified suprasellar or parasellar tumors. Calcification of the interclinoid reflection of the dura may imitate focal plaque like calcification of the internal carotid artery. Calcification of the intracranial

---

From the Section on Roentgenology, Mayo Clinic.

Read before the Section on Radiology at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J. June 11, 1947.

[1] Strom S.: Ueber die Röntgendiagnostik intrakranieller Verkalkungen, Fortschr. a. d. Geb. d. Röntgenstrahlen 27:577-601, 1921.

portion of the internal carotid artery is less common than that of the cavernous portion. When present, it is usually associated with extensive calcification of the artery. Rarely, calcification extending to the contiguous portions of the middle cerebral, anterior cerebral or ophthalmic arteries may be observed. In certain cases, the postero-anterior projection and the Granger or optic canal position are useful in checking the relation of the calcified vessel to adjoining structures.

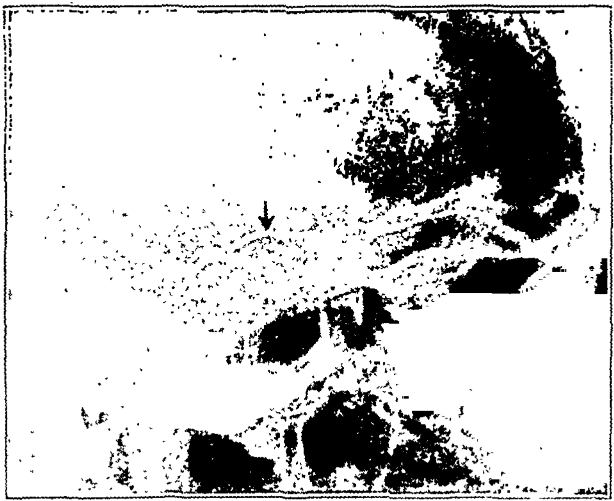

Fig. 1.--Intracranial aneurysm exhibiting *characteristic roentgenographic signs*: (1) curvilinear calcification in wall of aneurysm; (2) unilateral erosion of sella turcica; (3) localized erosion of anterior clinoid process contiguous to aneurysm.

Knapp[2] has suggested that, in cases in which the patients are elderly, pressure from a sclerotic and calcified internal carotid artery contiguous to the optic nerve may be a factor in producing a condition which will cause symptoms of glaucoma without tension, together with altitudinal visual defects, optic atrophy and cupping. Because of the rarity of this syndrome it would seem to be more easily explained by actual disease of the ophthalmic artery rather than by pressure from the internal carotid artery.

Aneurysm.—Although aneurysm of the internal carotid artery and related vessels has been of interest to the neurologist for a long time, its clinical importance has increased since the introduction of arteriography, which permits an accurate portrayal and precise localization of the lesion. In many cases localized roentgenographic changes, especially the presence of calcification, will permit the diagnosis of an aneurysm without the use of arteriography.

Calcification in an aneurysm of the internal carotid artery may vary from curvilinear plaques which outline a fusiform or saccular enlargement (fig. 1) to complete shell-like calcification which outlines the walls of a laminated clot or sac. The diameter of the shell-like calcification may vary from a few millimeters to several centimeters; the larger the lesion, the more irregularly rounded its contours become. Other important roentgenographic changes consist of unilateral erosion of the sella turcica, especially the adjoining anterior clinoid process, unilateral dilatation of the optic foramen and contiguous portion of the superior orbital fissure, and erosion of the margins of the carotid canal. Generalized enlargement of the sella turcica resulting from an aneurysm extending into the pituitary fossa may imitate the roentgenographic changes of pituitary tumor.

Calcification within the aneurysm was observed roentgenographically in 7 of 8 cases (87.5 per cent) reported by McKinney, Acree and Soltz.[3] These authors were the first to correlate the roentgenographic findings with the clinical phenomena of unruptured aneurysm of the intracranial portion of the internal carotid artery. The presence of unilateral exophthalmos and unilateral partial or complete involvement of the oculomotor and trigeminal nerves, and usually involvement of the optic, trochlear and abducent nerves, plus roentgenographic changes, constitutes conclusive evidence of such an aneurysm. Curvilinear deposits of calcium and unilateral bony changes about the sella turcica are the significant signs that distinguish aneurysms from pituitary and suprasellar lesions. Parasellar cholesteatomas or epidermoids which contain calcium more closely imitate the roentgenographic changes of aneurysm than does any other lesion that I have observed. Chromophobe tumors of the pituitary body which often are cystic and extrude laterally from the sella turcica as well as above may closely imitate the bony changes of aneurysm. Fortunately, those tumors rarely undergo calcification, but, when they do, it has been my experience that the calcification has been plaquelike and has simulated that which occurs in an aneurysm. In some instances in which the clinical data are not conclusive, the final diagnosis must rest on arteriography.

Angiomatous Malformation.—Angiomatous malformation may be classified as capillary (telangiectatic), venous and arteriovenous. These lesions are considered by most pathologists as developmental anomalies which may undergo subsequent change in size and character. They are primarily surface lesions of the cerebral hemisphere. They may be recognized as a simple enlargement of one or more vessels, or they may be more complicated and extend from the cerebral surface like an inverted cone with the apex contiguous to the lateral ventricle.

Roentgenologic interest in vascular lesions was stimulated by Weber[4] in 1928 when he reported a case of cerebral hemangioma associated with facial nevus and contralateral spastic hemiplegia. The roentgenogram of the skull revealed involvement of almost the entire left hemisphere by what was interpreted as calcareous deposits in the vessels of the meningeal angioma.

[3] McKinney, J. M.; Acree, T. and Soltz, S. E.: The Syndrome of the Unruptured Aneurysm of the Intracranial Portion of the Internal Carotid Artery, Bull. Neurol. Inst. New York 5: 247-277 (Aug.) 1936.

[4] Weber, F. P.: A Note on the Association of External Haemangiomatous Naevus of the Skin with Cerebral (Meningeal) Haemangioma, Especially Cases of Facial Vascular Naevus with Contralateral Hemiplegia, Proc. Roy. Soc. Med. 22: 431-440 (Dec. 13) 1928.

Weber[4] observed similar calcification in 8 of 21 other cases reviewed by him and concluded that the roentgenographic appearance was characteristic (fig. 2). Krabbe[5] in 1934 reported in detail the postmortem findings in a case similar to the cases reported by Weber.[4] He established proof that the calcification occurs in the second and third layers of the atrophic cortex and not in the pia mater, which may show abundant vascularity but no true angioma. The distribution of the masses of calcium in the cortical convolutions easily explains the tortuous nature of the roentgenographic shadows. Krabbe's observation has been confirmed by other observers, and the pathologic basis for such a roentgenographic finding seems firmly established. In addition, the calvarium overlying the affected hemisphere is thickened and asymmetric, as would be expected in the presence of cortical atrophy. Curiously enough, the vascular markings of the diploe and internal tables are not increased over the involved area. Similar findings have been observed in patients without associated nevus and there would appear to be many variants of this condition.

In cases of cerebral angioma, microscopic examination has disclosed calcification in the walls of the related blood vessels; however, the dominant roentgenographic finding in such cases is the calcification of the atrophic cerebral cortex.

Arteriovenous aneurysms, which usually arise from one of the major cerebral arteries or its branches, do not reveal roentgenographic evidence of associated calcification nearly as frequently as do angiomas. The significant roentgenographic changes consist of markedly increased vascularity of the overlying calvarium together with hypertrophic changes or thickening of the overlying bone.

Hematomas.—Although subdural hematomas, encountered rather commonly by neurosurgeons, do not present roentgenographic evidence of calcification as frequently as would be expected, when calcification is present, it may assume the form of faint strands or plaques of calcium about the lesion or of sheetlike masses of calcium about the lesion and in the contiguous meninges (fig 3). Formation of bone is not uncommon in the latter type of lesion and has been described by Schuller[6] as ossifying hematoma of the dura and has been considered by him to be the same condition as hemorrhagic pachymeningitis. It is possible that unilateral calcification of the meninges and falx cerebri of a young patient who has had a previous injury of the head but who does not have any deformity to suggest a localized hematoma may be a related condition.

Calcification within an intracerebral hematoma is usually revealed as a dense irregularly outlined mass which is from 1 to 5 cm. in diameter. Shadows of this type have been found so frequently in cases of old hemorrhage that their presence is of diagnostic significance. In my experience, they are more similar to the shadows of calcified intracranial tuberculoma than they are to the shadows of any other lesion.

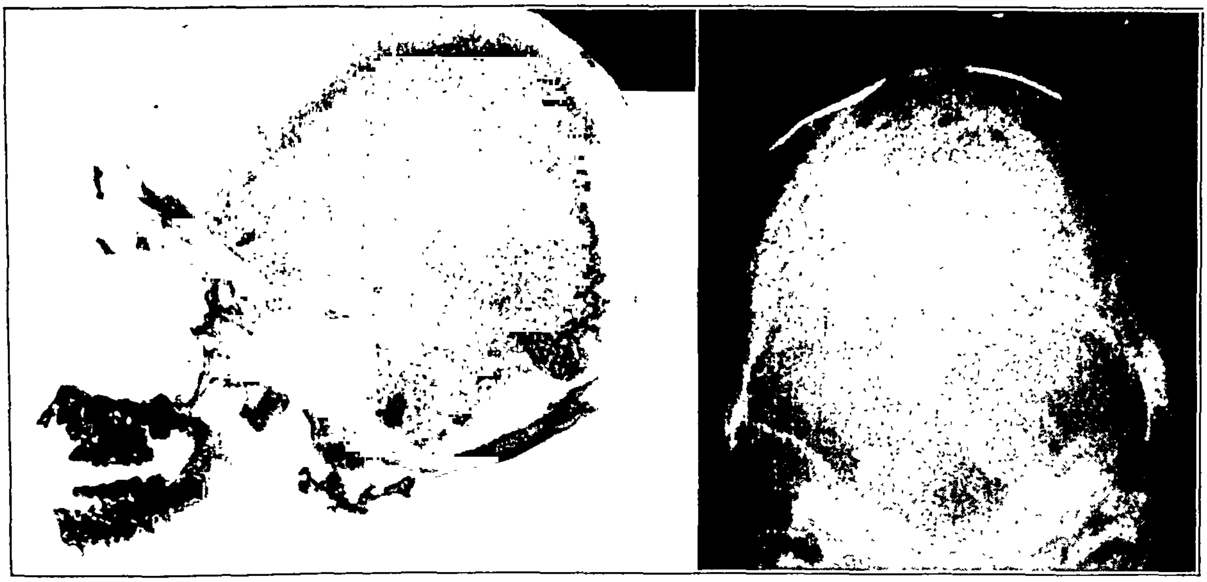

Fig. 2.— Calcification in second and third layers of cortex of atrophic right cerebral hemisphere associated with facial agioma (Sturge-Weber syndrome); asymmetry of skull and thickening of calvarium on right side resulting from atrophy of right cerebral hemisphere.

INFLAMMATORY LESIONS

Various authors have suggested that atypical and extensive calcification of the meninges may be the result of previous inflammatory disease of the meninges. However, in my experience, calcification and even ossification of the falx cerebri and meninges is so frequently observed in the absence of any history of inflammatory intracranial disease that it is doubtful if any significant relationship exists. Leary[7] and other authors have expressed the opinion that chronic hemorrhagic internal pachymeningitis, which has been of interest to pathologists for a long time, is of traumatic origin. Leary stated the belief that any inflammatory reaction that may be associated with such lesions is incidental or accidental.

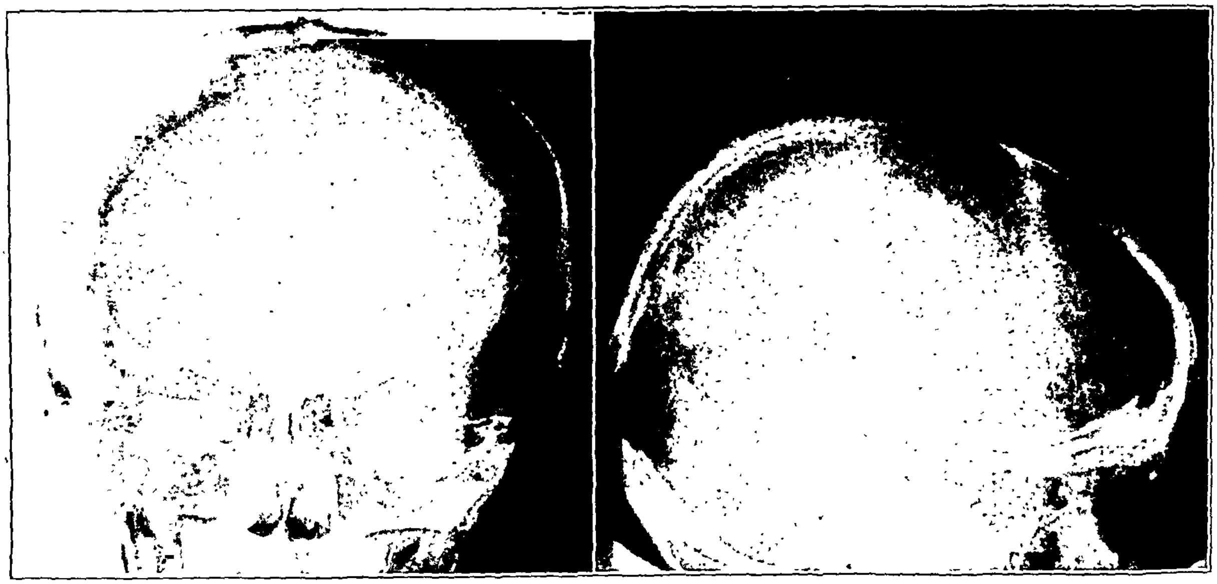

Fig. 3.—Subdural hematoma; plaquelike calcification in walls of hematoma and contiguous meninges.

Köhler[8] has stated that calcification in the reflection of the tentorium commonly known as the petroclinoid ligament is the result of chronic disease of the middle ear. In my experience there has been no relationship whatever between the two conditions. In the absence of associated encephalitis, intracranial calcification resulting from meningitis per se is indeed rare.

Calcification resulting from previous encephalitis may be observed in roentgenograms as multiple small dense areas distributed throughout the cerebrum and frequently in the basal ganglions (fig. 4). I have observed 2 instances in which miliary nodules of calcification occurred throughout the brain after epidemic polioencephalitis. In both of these cases the patients were children. Associated roentgenographic evidence of cerebral damage and degeneration is usually present as well.

Calcification of intracranial tuberculomas occurs in 1.3 per cent of cases according to Scott and Graves.[9] Evans and Courville,[10] in a more recent study, reported that such calcifi- occurs in 6.6 per cent of cases. Multiple lesions are much more frequent than solitary lesions and appear about as often in the cerebrum as in the cerebellum. Fifty per cent are observed in children in the first decade of life. Roentgenographically, the calcified nodules are revealed as discrete irregularly outlined dense masses of calcium, varying from 0.5 cm. to several centimeters in diameter (fig. 5). Pathologically, the calcification consists of myriads of coalescing calcospherities arranged in the form of a shell, which shrinks and fragments as the central portion of the lesion undergoes resorption. These changes account for the irregular roentgenographic contour. Associated formation of bone within the lesion is not uncommon. Evans and Courville have also described microscopic evidence of calcification in the walls of vessels in the central portion and at the margins of tuberculomas. Such calcification does not appear to play an important role in the roentgenographic appearance of the nodules.

Roentgenographic evidence of calcification within an old abscess of the brain has been mentioned by numerous observers. I have never encountered such calcification, and it would appear to be unusually rare.

PARASITIC DISEASE

The existence of toxoplasmic encephalomyelitis resulting from a protozoan parasite has been firmly established by the work of Wolf and Cowen[11] and their associates. The studies of Sabin[12] and of Callahan and his associates[13] suggest that this type of infection is more widespread than is generally realized. The roentgenographic changes described originally by Dyke and his co-workers[14] consist of multiple dense irregular nodules of calcification, often large in size, distributed throughout the cerebral cortex and basal ganglions. Not infrequently, curvilinear streaks of calcification may be observed in the basal ganglions (fig. 6). According to Sabin, 80 per cent of infants with the disease have hydrocephalus at birth or shortly thereafter, apparently the result of periventricular infiltration and ependymal necrosis.

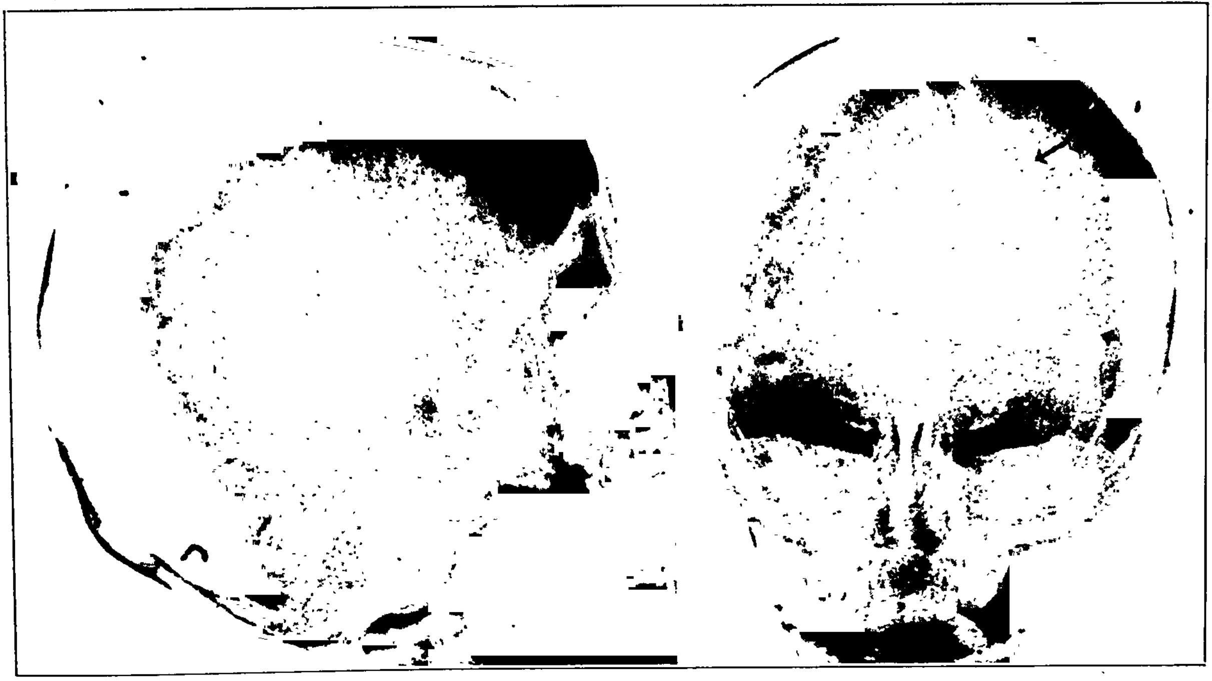

Fig. 4.—Fine diffuse granular calcification of brain subsequent to encephalitis of infancy. Toxoplasma reaction was negative.

Cysticercosis is not uncommon in foreign countries. With present means of transportation and more frequent intercontinental migration, infected persons will probably be observed with increasing frequency in this country. Roentgenographically, the lesion is revealed by the presence of multiple calcified encysted larvae in the muscles and the brain. The deposits of calcium in the muscles are fusiform in shape and vary from one to several millimeters in width and length. Within the brain, they are more globular or rounded instead of fusiform. In the majority of cases, the roentgenographic appearance is due to the deposition of calcium first within the fluid contents of the cyst and later in the degenerating remains of the parasite. Ultimately some calcium is deposited in the wall of the cyst. The scolex frequently is visible as an area of transparency unless it also has undergone calcification. In 32 of 284 cases reported by Dixon and Hargreaves,[15] roentgenologic examination revealed calcified cysts of the brain. In 2 cases, roentgenologic examination revealed the presence of calcified cerebral cysts when none could be demonstrated elsewhere in the body. The incubation period may vary from five months to twenty years, and according to MacArthur[16] the most dangerous period is from the sixth to the eighty year. Roentgenologic evidence of calcification of the cyst is rarely observed until five years after the time of infestation.

In trichinosis the calcified encysted trichinellae disseminated throughout the muscles and brain may be revealed in roentgenograms as small ovoid shadows of calcification about 1 to 2 mm. in size. Because of their small size they are not likely to be confounded with the larger shadows of cysticerci.

DEGENERATIVE LESIONS

In the presence of degenerative or atrophic lesions of the brain of congenital or developmental origin, deposits of calcium appear to

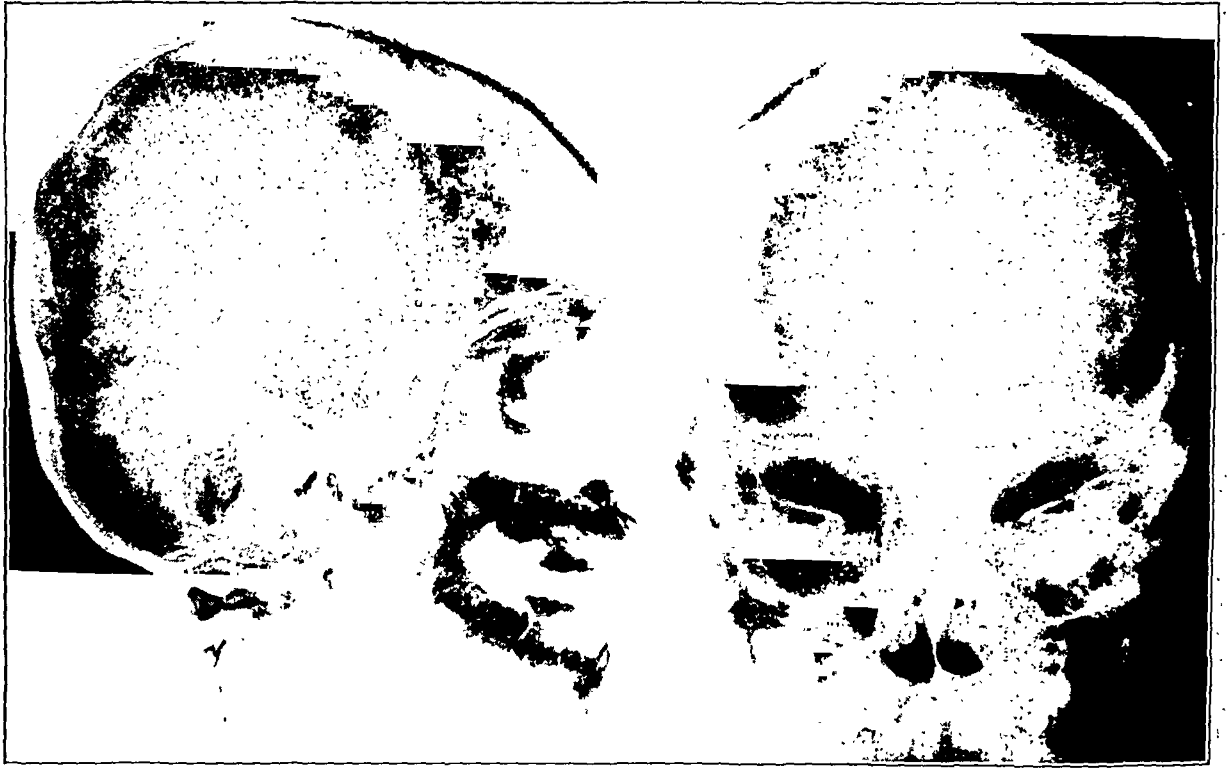

Fig. 6.—Toxoplasmosis. Multiple nodules of calcification in brain and basal ganglions. Curvilinear masses of calcium in the basal ganglions are often observed in this condition.

be laid down by the coalescence of perivascular colloid deposits in much the same manner as described by Krabbe in the presence of angioma. Roentgenographically the calcification is portrayed by a collection of irregular, convoluted shadows of increased density, corresponding to the shape of the atrophic convoluted cortex (fig. 7). Because these lesions are found in infants or small children, the overlying calvarium will reveal evidence of thickening and asymmetry owing to the atrophy of the underlying brain. If there should be an associated porencephalic cyst or collection of fluid, the overlying calvarium may be thinned and expanded.

TUBEROUS SCLEROSIS

Multiple small irregular nodules of calcium within the cortex are frequently observed in the presence of tuberous sclerosis. In my own experience, multiple small areas of calcification may also be observed symmetrically distributed in the basal ganglions. Dickerson[17] has called attention to the presence of patchy zones of hyperostosis in the diploe and internal table in this disease and has emphasized their relation to underlying tuberous nodules in the brain. The combination of such changes in the calvarium and intracranial areas of calcification would seem to be typical of this condition (fig. 8).

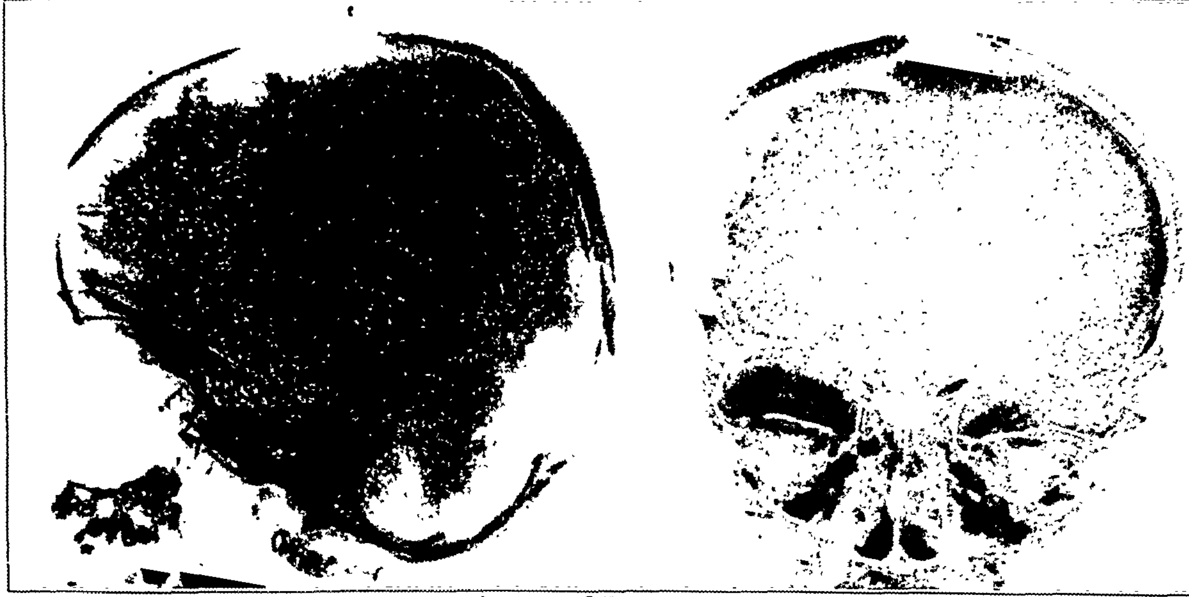

Fig. 7.—Extensive calcification of cerebral hemispheres, more pronounced on the right side, in a case of mental retardation since birth. There was no evidence of an angioma of the face or scalp. The character and distribution of the deposits of calcium are similar to those observed in the Sturge-Weber syndrome (fig. 2).

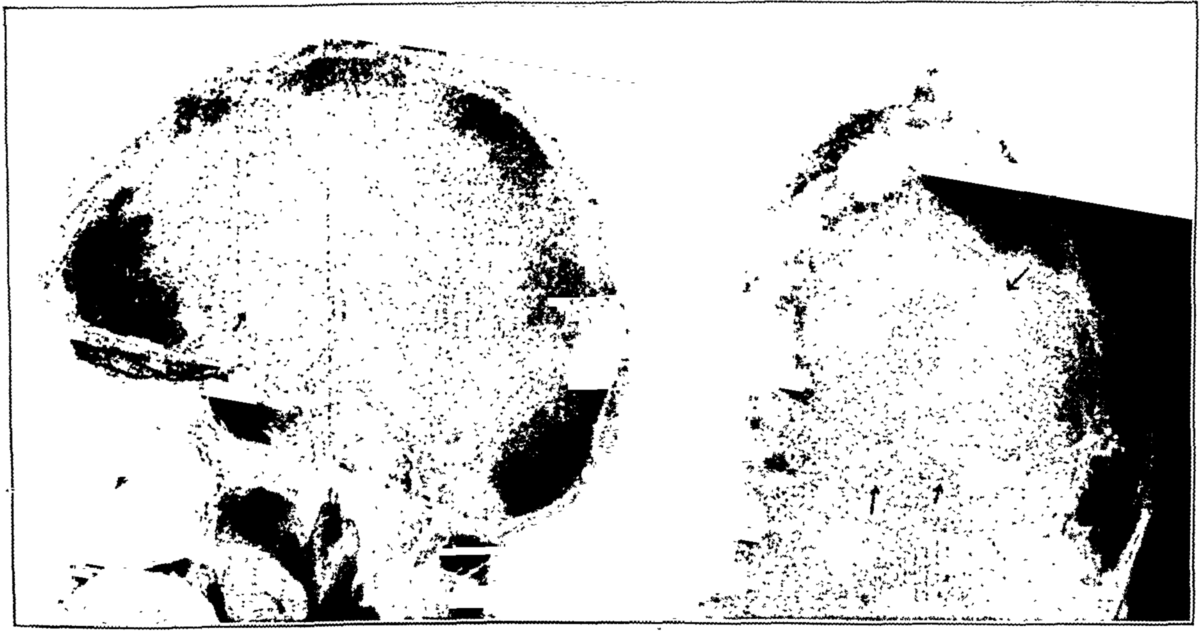

Fig. 8.—Tuberous sclerosis. Calcification of basal ganglions and left side of cerebrum and large mass of calcium in right side of cerebellum. Multiple patches of sclerosis in the calvarium.

PARATHYROID INSUFFICIENCY

To date at the Mayo Clinic, I have observed 12 cases of symmetric calcification of the cerebral basal ganglions in which there was definite clinical evidence of parathyroid insufficiency and tetany. In 1 of these cases the calcification followed a thyroidectomy at the age of 19 years and in the other 11 cases the disease was of the spontaneous type. Detailed clinical and roentgenologic data concerning these cases have been published by my colleagues and myself.[18]

---

[17] Dickerson, W. W.: Characteristic Roentgenographic Changes Associated with Tuberous Sclerosis, Arch. Neurol. & Psychiat. 53: 199-204 (March) 1945.

The pathologic basis for the roentgenologic changes is one of colloid deposition in and around the finer cerebral blood vessels with subsequent calcification of the deposits, which coalesce and form vascular sheaths and concretions. This is essentially the same microscopic change as is observed in the brain in association with other conditions and is probably a manifestation of degeneration of varying degree.

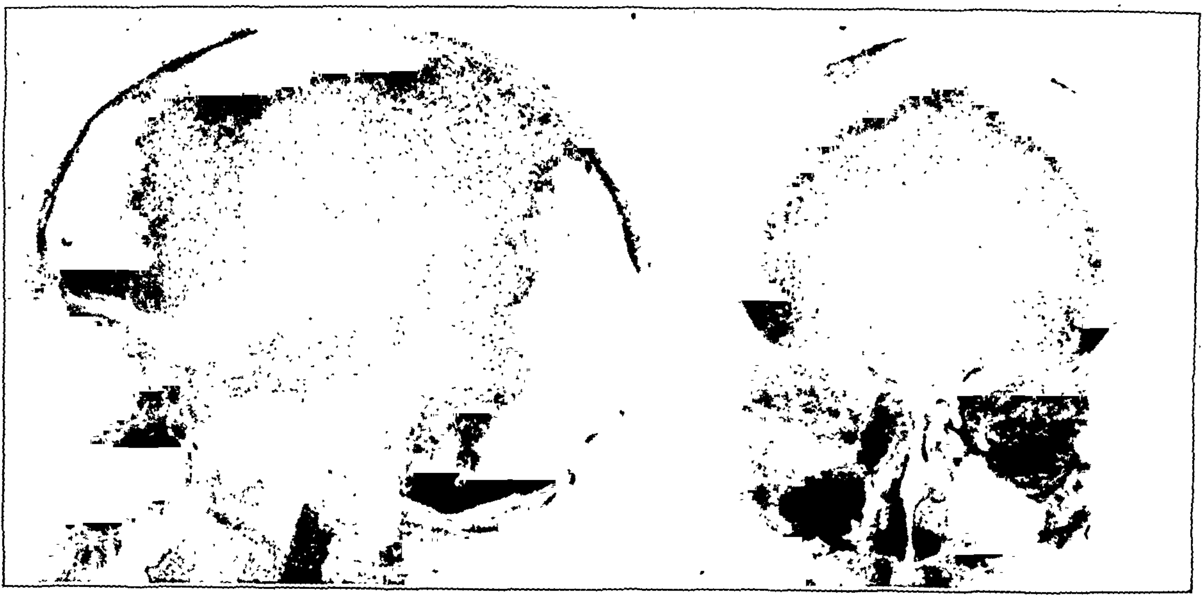

Fig. 9.—Spontaneous parathyroid insufficiency; Symmetric calcification of basal ganglions, which is commonly observed in this condition.

Symmetric calcification of the cerebral basal ganglions produces a characteristic roentgenographic appearance, and considerable variation in the degree and extent of the calcification may occur, depending on the stage of the disease at the time of the roentgenologic examination. The first roentgenographic evidence of calcification is small irregular discrete symmetrically distributed shadows of increased density in the region of the various basal ganglions, especially in the putamen and caudate nucleus (fig. 9). When the calcification is more pronounced, the irregular shadows have a wavy linear appearance. This is especially obvious in the dentate nucleus of the cerebellum and in the folds of the cerebellar hemispheres. As the masses of calcium coalesce, the shadows become larger, denser and more obvious. Coincident cerebellar calcification as well as evidence of calcification in the deeper layers of the cerebral cortex may be observed at any stage of the disease. The latter may be so marked as to simulate a vascular lesion or calcified glioma. The fact that the shadows are bilateral and symmetric is usually sufficient to exclude the possibility of tumor of the brain. Follow-up roentgenograms in cases of parathyroid insufficiency have revealed no change in the character and extent of the calcium shadows in spite of the definite clinical response to adequate calcium therapy.

Calcium deposits in the choroid plexus of the lateral ventricles may be confounded with calcification of the basal ganglions, especially in roentgenograms made in the posteroanterior projection. In cases in which diagnosis is in doubt, pneumoencephalography may be used to establish the relation of the shadows to the lateral ventricles. As mentioned previously, calcification of the basal ganglions may also occur after encephalitis and toxoplasmosis and in association with tuberour sclerosis and mental deficiency.

SUMMARY AND CONCLUSIONS

The roentgenologist should play a significant role in the identification of various conditions that exhibit intracranial calcification as part of their underlying pathologic changes. In spite of the fact that a similar microscopic distribution of calcium may be found in lesions of different cause, the gross configuration and distribution of the calcium masses as revealed in roentgenograms are frequently typical of various lesions.

ABSTRACT OF DISCUSSION

DR. EUGENE P. PENDERGRASS, Philadelphia: Dr. Camp has contributed a great deal to our knowledge on intracranial calcification. The pineal gland is calcified in many instances. I have seen it at birth. If it is at the normal position it is rarely mistaken for anything else.

---

G.: Symmetric Cerebral Calcification, Particularly of the Basal Ganglia, Demonstrable Roentgenographically; Calcification of the Finer Cerebral Blood Vessels, Arch. Neurol. & Psychiat. 41:921-942 (May) 1939. Eaton, L. M., and Haines, S. F.: Parathyroid Insufficiency with Symmetrical Cerebral Calcification: Report of Three Cases, in One of Which the Patient Was Treated with Dihydrotachysterol, J. A. M. A. 113:749-752 (Aug. 26) 1939. Camp, J. D.: Symmetrical Calcification of the Cerebral Basal Ganglia: Its Roentgenologic Significance in the Diagnosis of Parathyroid Insufficiency. Radiology. 49:568-577 (Nov.) 1947.

I have on one occasion misinterpreted a small shadow of calcification that was thought to be a pineal body displaced downward. At operation the calcific lesion was a rice body in a cyst of the third ventricle. Choroid calcification likewise may occur early. My associates and I have seen it as early as 4 years. Displacement may be due to contracting (atrophic) lesions and mass lesions. Calcification of the choroid may occur bilaterally or unilaterally. You will remember Dr. Camp's descriptions of symmetric calcification. One has difficulty in recognizing the cause unless one is given a clue to the diagnosis. Calcification of the falx may occur in the midline, or it may develop from either side of the falx. We have seen calcification of the internal carotid in persons aged 4 years. We have seen it in patients with hypertension. We know that it occurs in vitamin poisoning. There are so many pathologic calcifications that I hesitate to enter into that subject. I should like to call attention to calcification in porencephaly. That is another of these traumatic lesions. The intracranial calcifications that Dr. Camp showed you are unusual. He has had a number of them and they have been proved, so that there is no question about the diagnosis. They might have been thought to be tuberculomas and gliomas.

I should like to emphasize the importance of good roentgenographic technic. The slides shown by Dr. Camp illustrate beautifully what I would like to say. One should use fine focus tubes, good grids and good screens in examining the head. If a broad focus tube and poor technic are employed, calcification of lesions such as have been demonstrated here today will be missed.

DR. JOHN D. CAMP, Rochester, Minn: I have nothing to add except that I am sorry that Dr. Pendergrass did not have an opportunity to show you the slides that he showed to me last night. They portrayed excellent examples of many of the conditions which I have just shown you.

FULMINATING DERMATITIS BULLOSA MEDICAMENTOSA DUE TO "MESANTOIN"

DAVE B. RUSKIN, M.D.
Caro, Mich.

Methylphenylethyl hydantoin ("mesantoin"), one of the most recent clinically tested anticonvulsant drugs, has been credited with considerable effectiveness in the reduction and control of grand mal seizures. It appears to be somewhat less effective in the control of psychomotor attacks and seldom effective in petit mal. Most writers have attributed one or more side effects to the use of this drug. One of these discussed was the appearance in some patients of a cutaneous rash, a reaction which is also elicited with phenobarbital, diphenylhydantoin sodium ("dilantin") and trimethadione ("tridione"), the three most commonly used anticonvulsants. Eruptions due to drugs are usually pinkish or reddish, macular and of symmetric distribution, with more or less itching and burning, and may simulate any condition or disorder.[1] Because this reaction is encountered with the use of phenobarbital, diphenylhydantoin sodium and trimethadione, it is interesting to study the relationship of their chemical formulas to one another and to methylphenylethyl hydantoin. It will be noted (fig. 1), that the phenylethyl radical of phenobarbital plus the hydantoin radical of diphenylhydantoin sodium together yield the formula of a highly toxic drug, phenylethyl hydantoin ("nirvanol"), a drug used in the treatment of chorea.[2] This drug causes a macular rash, fever, eosinophilia, stupor and granulocytopenia. Further studies (fig. 1) also indicate that when the nitrogen carries a methyl group (CH^3) as a substituent, as in trimethadione, the resultant formula is that for methylphenylethyl hydantoin. Since both phenylethyl hydantoin nirvanol and trimethadione (tridione) produce reactions of the skin trimethadione only occasionally , it is not surprising that methylphenylethyl hydantoin is also observed to cause cutaneous reactions.

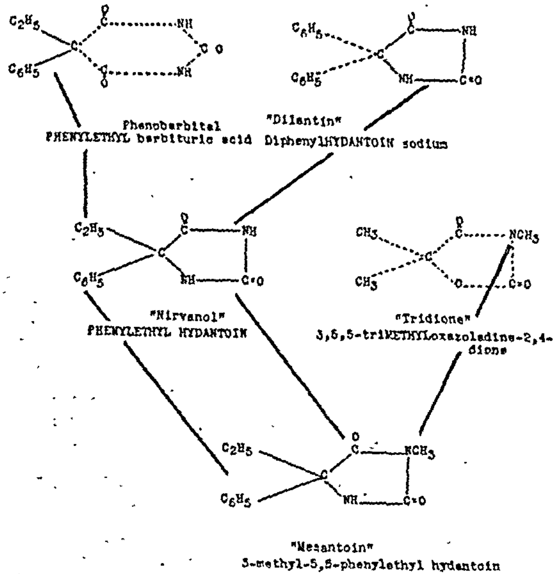

Fig. 1.—Chart showing the related formulas of anticonvulsants.

Loscalzo[3] reported a rash in 4.5 per cent of his group of patients receiving 5-phenyl-5-ethyl 3-methylhydantoin in combination with phenobarbital ("hydantal"). In all cases the reaction developed within two weeks. He reported a communication from Kozol[4] in which it was reported that virtually no rashes resulted when treatment with methylphenylethyl hydantoin was begun in small doses and the dose increased gradually. In Loscalzo's 3 patients, the rash completely disappeared in approximately ten days when treatment with the drug was discontinued. He reported having noted no effect on the blood.

[3] Loscalzo, A. E.: Treatment of Epileptic Patients with a Combination of 3-Methyl-5, 5-Phenylethylhydantoin and Phenobarbital (A Preliminary Report), Nerv. & Ment. Dis. 101:537 (June) 1945.

[4] Kozol, cited by Loscalzo, A. E.: The Control of Epilepsy: An Interim Report on 3-Methyl-5, 5-Phenylethylhydantoin and Phenobarbital Therapy, J.A.M.A. 145:496 (Oct. 25) 1947.

Kozol[5] reported a rash in 10 per cent of the patients in his group taking methylphenythyl hydantoin, but by desensitizing some of them he was able to reduce this figure to 7 per cent.

Lennox [6] listed 14 per cent as having a generalized measles-like rash. In these cases, blood cell counts, at the onset and at the height of the eruption, did not reveal any abnormalities except moderate leukocytosis.

Elsewhere[7] I have reported the results of one year's administration of methylphenylethyl hydantoin to a group of 26 institutionalized patients. I indicated that (1) the occurrence of toxic reactions did not necessarily increase proportionately with the dosage and (2) toxic reactions appeared to depend more on the patient than on the drug. Of the toxic reactions, the complaint of drowsiness was the most frequent, but was independent of the dosage or the concurrent administration of phenobarbital. Only 1 patient (3.8 per cent) presented a rash, which was scarlatiniform in nature and which appeared when the patient received only 0.1 Gm. daily. This rash disappeared when treatment with the drug was discontinued and did not reappear when the patient was again receiving the drug. By starting, the second time, with a smaller dosage and raising the dosage slowly, it was eventually possible for the patient to receive 0.3 Gm. daily.

Since the completion of the one year study on the original 26 patients, the drug has become more plentiful and an increasing number of patients are gradually being added to the original group. In only 1 of these did a rash develope. Unfortunately, this rash did not present the fairly innocuous picture I might have expected from my own past experience or the experience of others. This report is, therefore, presented to serve as a word of caution against the unbridled enthusiasm which often follows the development of a new fairly successful treatment for a condition which, in the past, has been so unresponsive.

REPORT OF A CASE

The patient, an only child, was born on April 9, 1938, following a pregnancy complicated by nausea and "heartburn." The family history indicated that a parental grandmother was committed to a mental institution with a diagnosis of melancholia. Several paternal aunts were said to have had seizures. A paternal cousin was feebleminded from birth. The maternal grandmother had conculsions. A maternal aunt was committed to a mental institution with a diagnosis of dementia precox, paranoid type. The mother had convulsions during infancy.

The mother was 18 at the time of the patient's delivery, and the delivery was normal. The patient began cutting teeth at 2 months and at 1 year had a full set of molars. At 6 or 8 months, she was dropped on her head.

She had her first convulsion at 9 months. At 11 months, she was hospitalized, with a diagnosis of acute infection of the respiratory tract and convulsions. At 15 months, she began to walk, but not without difficulty. At 3 years of age she had measles. At 4 she had whooping cough and another unidentified illness associated with a rash. At this age she had the habit of masturbation, which later ceased. She was subject to frequent earaches, particularly of the left ear. Also at this age she hit her head on the cement, causing unconsciousness.

She began regular attendance at school, but was sent home because of poor adjustment. At 5 she was hospitalized for tonsillectomy. She was again hospitalized at 6, with a diagnosis of "low intelligence, behavior problem and convulsions." These convulsions had never been frequent and had usually been associated with some infection An electroencephalogram was taken at this time and the results interpreted as no. 4 abnormal (the classification range being from 1 to 5, with 5 considered grossly abnormal). Her intelligence quotient was 86, with erratic unstable personality. Roentgenograms of the skull were reported as showing no abnormalities. She was enrolled in the White Special School, Detroit, but made no adjustment, and it was impossible to allow her in a classroom for more than an hour daily. She was soon removed as uncontrollable. She would spit, kick, and tear papers of other children.

During this 12 month interval, she was followed up in a neurology clinic, and treatment with neither diphenylhydantoin sodium nor phenobarbital affected the seizure incidence or behavior. A rash and ataxia developed with either drug. Her seizures were infrequent, and her difficulties became decreasingly of a convulsive nature and increasingly on the basis of personality. She became more talkative, repetitious, destructive and unsafe if left alone or with other children. Omission in treatment of diphenylhydantoin sodium and administration of sodium bromide did not decrease the difficulties.

At 7 she was admitted to a state mental institution, where she was described as excitable, talkative, uninhibited and brutal toward others. Her activities were of a manic nature. She seemed less mature than the average 7 year-old child. She showed a severe speech defect, with inability to pronounce several letters (g, y and f) and slurring. Her intelligence quotient at this time was 66. She walked with an unsteady gait and presented constant mydriasis. Results of laboratory studies were negative.

Three months after admission she was paroled as improved, with a formal diagnosis of psychosis with convulsive disorder. She returned

to the White Special Hospital, but was able to attend for only a few weeks, because of her behavior.

Two months after parole from the mental institution she was admitted to the Caro State Hospital.

Physical examination on admission disclosed a 7 year old girl of normal height and slightly underweight. Her mentality was estimated at approximately 4 years. She was overproductive and uninhibited. Complete physical and neurologic examinations failed to reveal any abnormalities. Roentgenograms of the chest were normal. Serologic reactions were negative (Kahn). Urinalysis revealed no abnormalities. A complete blood cell count yielded the following observations: 4,520,000 red blood cells, 8,700 white blood cells, 81 per cent hemoglobin (12.8 Gm.), 54 per cent segmented polymorphonuclear cells, 14 per cent stab forms, 29 per cent lymphocytes, 1 per cent monocytes, 1 per cent juvenile cells and 1 per cent basophils. The spinal fluid was under normal pressure and clear, with negative reactions to globulin and Kahn tests. The colloidal gold curve was 0000000000. Examinations of the stool revealed no bacilli of the typhoid dysentery type. Psychologic tests revealed an intelligence quotient of 72 by the Revised Stanford Binet (form L) and 73 by the Goodenough tests, and she obtained a performance rating of 14 in the Metropolitan Readiness Test.

Two months following her admission the school reported that she was uncooperative and unable to follow even simple instructions. However, there was some indication that she was more stable than on admission. An electroencephalogram revealed a grossly abnormal record, with petit mal variant and psychomotor components, and amplitude asymmetry.

She had one grand mal seizure during the first six months of her hospitalization. Shortly after this, she went home on vacation. While at home she had three seizures in an interval of less than twenty-four hours. These seizures occurred ten days after her return home and were followed immediately by vomiting and acute pharyngitis. The latter responded to treatment with sulfonamide drugs. However, a rash developed from this drug. Five days after the onset she presented a rash of measles. She was returned to the hospital two months later. After her return in 1947, she had three seizures, the last one occurring simultaneously with the onset of chickenpox. On Jan. 31, 1948, she had two grand mal seizures. Her behavior continued to be a problem both in the cottage and in the school. She was given methylphenylethyl hydantoin, 0.3 Gm. daily, beginning February 3. On February 14 a rash developed, characterized by maculas of pinhead size on the face and neck. She was feeling well. There was no erythema of the throat, no spots on the mucous membranes of the mouth or throat and no cervical adenitis. Her temperature was normal. On the next day there was a considerable increase in the number and size of erythematous patches, involving the face, neck, abdomen, thigh and back and, to some extent, the legs and forearms. There was a moderate amount of injection of the conjunctivas. There was no change from normal in the appearance of the buccal mucosa, but the pharynx was slightly hyperemic. The temperature was 100 F. She did not appear ill otherwise and ate heartily. Treatment with methylphenylethyl hydantoin was abruptly discontinued.

Two days after the rash developed, she was hospitalized with a temperature of 105 F. She appeared prostrated and was extremely uncomfortable from the itching. The face was swollen. The eruption was coalescing, and large blebs developed at the mucocutaneous junction on the lower lip. All cutaneous lesions were now elevated, palpable and beginning to form blebs and bullae. These bullae coalesced, so that large areas resembled an extensive second degree burn superimposed on a red maculopapular rash. Ulcers developed on the buccal mucosa. The photographs in figure 2 represent the condition as of February 17, two weeks after the start of treatment with the drug and three days after discontinuance. She received penicillin, 40,000 units about every three hours, ½ grain of codeine as needed, 4 cat units of a digitalis preparation ("digifolin"), oxygen by tent and fluids by mouth at the time of hospitalization. This treatment

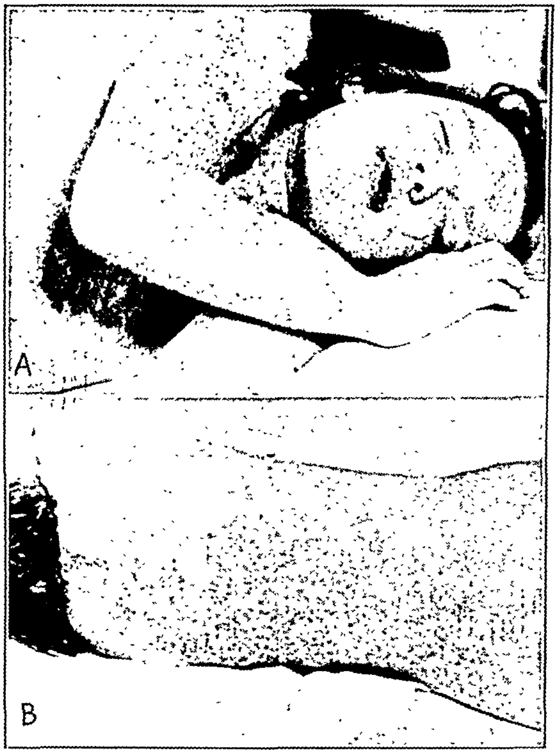

Fig. 2.—Photographs taken on the third day of the rash. *A*, demonstration of both broken and unbroken blisters on the face and the trunk, involvement of the lips and elevated nature of the right forearm. *B*, involvement of the posterior portion of the trunk, with a collapsed blister between the scapulas.

was continued daily, except that the digitalis preparation was reduced in dosage to 2 cat units. She became distended on the second day of hospitalization, as a result of paralytic ileus.

Attempts were made to administer fluids and plasma intravenously, but this had to be discarded as so much skin was involved in the reaction that it was impossible to locate a vein. The eyes and lips were treated prophylactically. Enemas failed to reduce the distension, and a neostigmine preparation, which was administered every three hours, was used to combat the ileus. An attempt to cut down on a vein, under local anesthesia, met with failure, as the veins that were encountered collapsed and failed to remain patent.

Fluids were administered subcutaneously until the fourth day of hospitalization, at which time the ileus had cleared and she was able to take limited amounts of fluid by mouth. Her general condition on that day was no worse than on the second day of hospitalization. Figure 3 indicates the condition of the skin. Even the soles of the feet were involved with rash and blisters. It was necessary, on the second day, to use morphine compound (1/6 grain) instead of codeine to relieve the pain and restlessness. A week after hospitalization, the patient had lost the superficial layer of the skin of two thirds of the body. During the first week of hospitalization decided leukocytosis developed. There was originally a relative as well as an absolute increase of stab nuclear neutrophils. Within a few days there was a progressive drop in the total white cell count, with a drop of mature neutrophils to 8 per cent and stab nuclear neutrophils to 30 per cent and a real as well as relative increase of lymphocytes to 59 per cent. The mature neutrophils continued to remain at a low level; there was a temporary secondary rise of the stab nuclear cells and a gradual decline in the lymphocytes. Greater areas of the skin continued to become involved. Treatment of the skin became mainly a problem of arresting the loss of serum, as in a burn. Secondary leukocytosis developed, followed by a second drop in the white cell count and a terminal outpouring into the blood stream of juvenile forms of the neutrophilic cell (fig. 4). With this last change in the blood, there was also a decrease in red blood cells and hemoglobin. With no apparent change in her condition otherwise, she gasped and died. Permission for autopsy could not be obtained. The patient had one seizure on the day that treatment with methylphenylethyl hydantoin was discontinued and none from then to the time of her death, February 27.

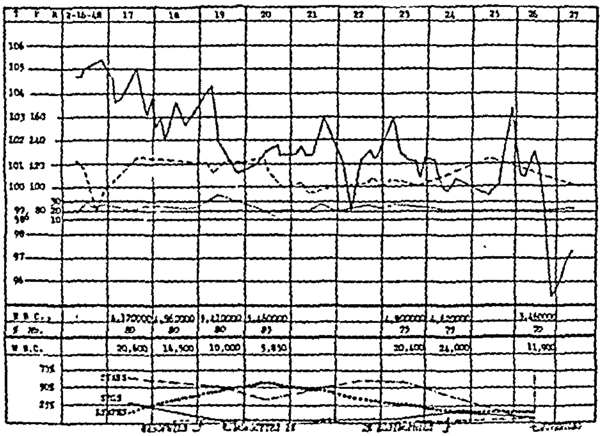

Fig. 4.—Chart showing the temperature, pulse rate, respirations and results of studies of the blood during the period of illness.

SUMMARY

A girl, aged 10, had a history of repeated manifestations of cutaneous reactions to various drugs, including anticonvulsants. After having taken methylphenylethyl hydantoin ("mesantoin"), 0.3 Gm. daily for twelve days, a rash developed, with changes in the blood picture. The clinical course led rapidly to her death.

CONCLUSIONS

Methylphenylethyl hydantoin ("mesantoin"), which has proved to be useful as an anticonvulsant in epilepsy, may cause serious side effects, among which are reactions of the skin and changes in the blood. Although the rashes are usually benign and respond quickly to cessation of treatment with the drug, it is possible for this complication to be of a serious nature. It is necessary to use extreme caution in treatment with this drug, especially if the patient has shown earlier sensitivity of the skin. This complication does not necessarily depend on the administration of a large dosage.

All patients should receive examinations of the blood before and during treatment with this drug. The examination of the white blood cells and a blood smear are as important (if not more so) as an examination of the red blood cells and the estimation of hemoglobin. The physician should inquire into the possibility of previous changes in the blood, whether or not the changes may have been the result of ingestion of other drugs. Once it has been determined that methylphenylethyl hydantoin should be used, it should be administered in small initial doses and increases should be made slowly and by small increments. This cannot be stressed too strongly. All patients chosen to receive this drug should be cautioned to discontinue its use as soon as side effects are experienced and to report this to their physicians.

Clinical Notes, Suggestions and New Instruments

MANAGEMENT OF GASTRIC HEMORRHAGE USING TOPICAL THROMBIN

T. M. ROGERS, M. D.
Sterling, Colo.

The most common complication of peptic ulcer is hemorrhage. In persons over 40, because of the rigidity of the arterial walls, severe bleeding is more common. The mortality in this age group is eight times that of those under 40. The mortality of those whose hemoglobin is below 9.4 Gm. (60 per cent) is four times that of those whose hemoglobin is above 60 per cent.[1]

Thrombin is a sterile, standardized, hemostatic powder obtained from bovine plasma, and was originally intended to contract capillary bleeding either as a dry powder or in sterile isotonic solution. Its action depends on its ability to clot fibrinogen, thus forming a natural clot which seals the capillary ends. It is supplied in sterile packages of ampules containing 5,000 Iowa units.[2]

REPORT OF CASES

CASE 1.—On March 15, 1947, at about 3 a.m., A.J., a business man aged 64, was found in a semicoma lying on the bathroom floor of his home in a pool of vomited blood. Two days previously, he recalled later, he had become nauseated and "fainted" after passing a large tarry stool. He denied any recent gastric pain or distress. A local physician was called and morphine was given subcutaneously; he was restricted from fluids or food and kept at bed rest. During the day he had a large coffee ground vomitus and in the evening of the following day he was referred to the hospital. In 1934, he recalled later, he was placed on an ulcer regimen for four months, after roentgen examination during the course of investigation for epigastric distress. Physical examination showed a moderately ill man appearing weak with drawn facies and a subicteric tint to the skin and sclera. The skin and mucous membranes were dry with evidence of dried blood about the lips. Heart and lungs were normal, blood pressure was 110 systolic and 60 diastolic; the pulse rate was 72. The abdomen was distended and slightly tympanitic, with tenderness in the upper right quadrant. Except for hyperactive reflexes and tarry residue in the rectum, the examination gave normal results, urine was normal, hemoglobin 9.4 Gm., red blood cell count 3,050,000, white blood cell count 6,000, with 75 per cent segmented cells.

Because of the relatively good condition of the patient at this time it was felt that conservatism was the course to follow, and he was placed on a modified Andresen regimen, consisting of hourly feedings of skimmed milk and gelatin solution, with hard candy between feedings. Meperidine hydrochloride and barbiturates were administered freely for restlessness and pain. During the afternoon of the following day he became extremely faint, vomited a large amount of bright red blood and chilled; the pulse became rapid and irregular as he showed signs of air hunger and hemorrhage. The hemoglobin dropped to 6.3 Gm., the red blood cell count dropped to 2,650,000 and the white blood cell count rose to 10,000. In spite of vitamin K, liver extract, epinephrine orally, sedation, subcutaneous administration of dextrose and isotonic solution of sodium chloride with human blood plasma, and blood transfusion his condition became more precarious with each succeeding day. On March 20, 1947, the red blood count dropped to 1,800,000, the temperature rose to 103.6 F., the pulse rate to 140 and the respiration rate to 140. He was irrational, confused, noisy and uncooperative. Each transfusion appeared to initiate bright red vomitus and large involuntary tarry stools. In desperation, "pentothal sodium" was given intravenously in a 10 per cent solution and repeated as necessary. This was followed by short periods of deep sleep with quietness and rest. The pulse and respiration rate and temperature dropped, and he became more rational. Later this was administered into the blood transfusion tubing, and a more prolonged and lighter anesthesia resulted. Just at the time that my associates and I felt that we were gaining, on the afternoon of the fifth hospital day, he showed more signs of hemorrhage and within an hour vomited a large amount of bright red blood and passed several blood red stools. With the patient practically moribund we mixed 10,000 units of thrombin with 2.5 cc. of isotonic sodium chloride solution and administered it orally. From this time on there was a gradual but steady improvement without hematemesis and with only an occasional tarry stool. The usual ulcer type of regimen with supportive treatment and the continued use of thrombin orally, three doses daily for five days, and "pentothal sodium" intravenously, as needed, resulted in steady progressive improvenent. On the seventeenth hospital day he was up and out of bed. He was discharged to his home on the twenty-seventh day. Hemoglobin had returned to 10,9 Gm. and red blood cell count to 3,500,000.

During the early part of his hospitalization we felt that we were dealing with an ulceration into a sclerotic large blood vessel. We were more than once tempted to resort to surgery, but with statistics revealing increased mortality, we continued to follow the so-called conservative course. Topical trombin having been used to stop bleeding in certain previous operative procedures, a try here proved to be of definite advantage at a critical period.

Subsequently, as the strength, general condition and blood count improved, a roentgen examination on May 1, 1947 revealed a healing prepyloric ulcer. On May 5, 1947, a posterior gastroenterostomy was performed. A dense scar was noted in the prepyloric area. Recovery was uneventful, except for peripheral neuritis of his left arm, which is slowly diminishing with large doses of thiamine hydrochloride and physical therapy. While on a modified bland diet he is carrying out his normal activities. There has been no return of symptoms.

[2] Parke-Davis Company. An Iowa unit is that amount of thrombin to clot 1 cc. of standard fibrinogen in fifteen seconds.

Case 2.—J.G., a student aged 16 years, was admitted via ambulance to the hospital on Sept. 16, 1947, after a large bloody emesis two hours previously. On arrival at the hospital he vomited about 2 cups of dark brown blood. Three weeks previously a diagnosis of rheumatic fever had been made, and he was given moderately large doses of acetylsalicylic acid. For three days before admission he gave rather indefinite symptoms of gastric distress one and a half to two hours after meals. Physical examination revealed an acutely ill, apprehensive lad, with a rapid, thready pulse; a mild systolic murmur was heard at the apex and in the left axillary region. There was a definite midepigastric tenderness. Complete blood cell count taken immediately revealed 3,050,000 red cells, 11,000 white cells and hemoglobin of 9.4 Gm. Thrombin, 10,000 units in an isotonic solution, was given by mouth that evening and repeated three times the following day. A modified Andresen diet was given. Recovery was prompt and uneventful. There being no further evidence of hemorrhage, he was discharged September 28 on a modified ulcer diet. To date, Dec. 4, 1947 he has had no recurrence of bleeding or gastric distress. Salicylates are given, enteric coated. For reasons best known to his parents, roentgen examination was refused.

SUMMARY

Two cases of gastric hemorrhage in which there was dramatic response to orally administered topical thrombin was reported, in 1 of which there was a gastric hemorrhage in a 64 year old man to the extent that he was nearly exsanguinated. This was proved to b due to a peptic ulcer eroding into a large blood vessel. The second case was in a youth aged 16 who had two moderate sized gastric hemorrhages which were due to acute gastritis. Both patients responded rapidly to orally administered topical thrombin.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following reports. Howard A. Carter, *Secretary.*

MICROWAVE RADIATIONS

Heating of Human and Animal Tissues by Means of High Frequency Current with Wavelength of Twelve Centimeters (The Microtherm)

STAFFORD L. OSBORNE, Ph.D.
and
JESSE N. FREDERICK, M.S.
Chicago

Radar was made possible by development of the magnetron oscillator tube. Radar was one of the closely guarded secrets during the war. Now, with the ending of hostilities, its field of usefulness has been extended into the field of medicine. The Raytheon microtherm, which generates energy in a continuous wave, air-cooled magnetron oscillator tube, is the first generator of this type to be developed for the heating of human tissues. The microtherm operates at a frequency of 2,400 to 2,500 megacycles, or at a wavelength of approximately 12 cm. with a maximum power output of 125 watts. The energy is applied to the patient by means of a director (fig. 1). The entire radio-frequency circuit consists of the magnetron oscillating tube with a coaxial cable connected to a director.

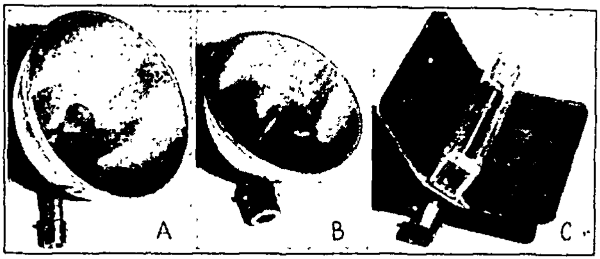

Fig. 1.—Types of directors: *A*, hemispherical, 6 inches in diameter; *B* hemispherical, 4 inches in diameter, and *C*, rectangular

This investigation was undertaken to determine whether high frequency current of this magnitude would heat living tissues to a temperature of 104 F., at a depth of 2 inches (5.08 cm.). It was also necessary to learn whether the heat gradient as the result of treatment was normal, that is, a decreasing temperature from superficial to the deeper underlying tissues, or whether there was a reversal of this normal heat gradient. The Council on Physical Medicine of the American Medical Association loaned a Raytheon microtherm to make these studies possible. The following experiments were undertaken:

1. The thighs of dogs were subjected to the high frequency energy. Temperature measurements were taken at a depth of ½, 1, 1½ and 2 inches (1.27, 2.54, 3.81 and 5.08 cm.) from the surface to secure the heat gradient from the surface to a depth of 2 inches (5.08 cm.).
2. The eyes of dogs were exposed to the high frequency energy. Temperature measurements of the vitreous humor of the eye were taken. The eyes were examined for evidence of damage.
3. The frontal sinus of the dog was subjected to the high frequency field. Temperature measurements were taken within the frontal sinus cavity.
4. The thighs of human subjects were treated and temperatures recorded at a depth of approximately 2 inches.

METHODS

All temperatures were measured with thermocouples made of constantan and copper wires (28 gage Leeds and Northrup double cotton covered and enameled) soldered into the tip of a 16 gage lumbar puncture hypodermic needle. The couples were connected to a potentiometer of requisite sensitivity. For the animal work, five hypodermic needle thermocouples and one rectal thermocouple were connected by means of a switch box to the potentiometer. The couples were calibrated against a thermometer calibrated by the Bureau of Standards with scale divisions in 0.1 degree Fahrenheit. Calibration tests indicated that the potentiometer and thermocouple combinations were accurate to within ± 0.2 degree F. The thermocouples were removed from the field of microwave emanation during the heating. To conform to general clinical practice, microwaves were applied for twenty minutes.

The Raytheon microtherm was used for all experiments. Radio waves of 12.2 cm. length were channeled through a coaxial cable to a director. From the director the waves were beamed onto the surface to be heated. Two hemispherical directors, one 4 inches (10.16 cm.) and the other 6 inches (15.24 cm.) in diameter, and a rectangular director were used.

Received for publication January 26, 1948.

From the Departments of Physical Medicine and Physiology, Northwestern University Medical School.

This study was made possible by a grant from the Council on Physical Medicine of the American Medical Association.

The hemispherical directors produced circular surface-heating patterns with maximum heating approximately ½ inch (1.27 cm.) inside the outer circumference of the director. The rectangular director produced an elliptical surface-heating pattern with maximum heating at the center. All temperatures were taken within the area of maximum heating.

1. *Leg Muscle of the Dog.*—Fourteen experiments were carried out on animals under anesthesia with pentobarbital sodium. The hair was clipped from the lateral aspect of the thigh, and thermocouples were inserted within an area 1 inch (2.54 cm.) square posterior to the femur. Temperature measurements were made after a suitable control period preceding and following each treatment. Skin temperatures were omitted because they were considered unreliable. Subcutaneous temperatures were taken within twenty seconds after the cessation of heating. Temperatures were then taken in the following order and at the following depths: ½, 1, 1½ and 2 inches (1.27, 2.54, 3.81 and 5.08 cm.). The entire procedure was completed within 1½ minutes after the heating was stopped.

2. *Eye of the Dog.*—Seven treatments (exposure of the eyes to the high frequency energy) were given on "acute" animals and six treatments on 1 "chronic" animal. On 1 "acute" animal the temperatures of the vitreous body of the two normal eyes were compared and found to be within 0.2 degree Fahrenheit of each other. In the acute animals control temperatures were taken in the vitreous body of one eye and the other eye was treated. Final temperatures were taken in the vitreous body of the treated eye. One animal received a series of six treatments on the left eye over a period of three weeks. Each treatment was given under anesthesia with pentobarbital sodium. Temperatures were not taken, but the treated eye was studied with an ophthalmoscope before and after each treatment. The temperature reached in the "chronic animal was between 105 and 106 F., based on temperatures obtained in acute animals receiving similar treatment. All treatments in the "acute" and "chronic animals were given with the rectangular director at a spacing of 2 inches (5.08 cm.). Rectal temperatures were taken before and after each treatment.

3. *Frontal Sinus of the Dog.*—Six experiments were carried out on dogs under anesthesia with pentobarbital sodium. Control temperatures were taken on the sinus to be treated by inserting the thermocouple through the medial end of the supraorbital border of the frontal bone into the cavity of the sinus. The rectangular director was used at a spacing of 2 inches (5.08 cm.).

RESULTS

1. *Leg Muscles of the Dog.*—The average thigh temperature for ten experiments using a 6 inch (15.24 cm.) director placed at a skin-source distance of 1 inch (2.54 cm.) is recorded in table 1.

The average thigh temperature secured on 3 animals by using the 6 inch (15.24 cm.) director but at a 2 inch (5.08 cm.) skin-source distance is given in table 2.

TABLE 1.—*Average Thigh Temperature for Ten Experiments (Six Inch Director at a Skin-Source Distance of One Inch)*

Depth of Thermocouple	Temperature F. Before	After	Maximum
Subcutaneous	95.7	108.0	112.7
½ inch	97.4	107.1	
1 inch	99.1	106.3	
1½ inches	100.4	105.1	
2 inches	100.4	104.1	106.1
Rectal	102.2	102.4	

The temperature difference between the subcutaneous and 1 inch (2.54 cm.) level showed more variation among individual experiments than did the difference between the 1 inch (2.54 cm.) and 2 inch (5.08 cm.) levels. In one experiment the animal was exposed to a strong breeze during treatment. The final temperatures showed an increase from the subcutaneous level to a depth of 1½ inches (3.81 cm.), as shown in table 3.

Another unusual situation was encountered in one single experiment. The final temperature at a depth of 1½ inches (3.81 cm.) was 107.3 F., while at the 1 inch (2.54 cm.) depth the temperature was only 106.6 F. At autopsy the thermocouple at the 1½ inch (3.81 cm.) level was found to be embedded in a mass of fat.

TABLE 2.—*Average Thigh Temperature in Three Experiments (Six Inch Director at Skin-Source Distance of Two Inches)*

Depth of Thermocouple	Temperature F. Before	After
Subcutaneous	95.9	107.7
½ inch	98.2	106.6
1 inch	98.8	106.2
1½ inches	99.6	103.8
2 inches	99.4	103.2
Rectal	101.5	101.5

TABLE 3.—*Increase in Temperature from Subcutaneous Level to Depth of Two Inches*

Final subcutaneous temperature	100.8 F.
Final temperature at depth of ½ inch	104.4
Final temperature at depth of 1 inch	105.1
Final temperature at depth of 1½ inches	107.1
Final temperature at depth of 2 inches	104.4

The average thigh temperatures in four experiments with the smaller 4 inch (10.16 cm.) director, used at a skin-source distance of 2 inches (5.08 cm.) and directed along the anterior border of the thigh, are recorded in table 4.

In two of these experiments the animal received burns along the anterior border of both thighs. The burned areas sloughed to a depth of approximately ½ inch (1.27 cm.) five days later, and the lesion required six weeks to heal. Figure 2 shows a typical cooling curve for subcutaneous tissues and tissues heated at a depth of 2 inches (5.08 cm.).

TABLE 4.—*Average Thigh Temperatures of Four Experiments (Four Inch Director at Skin-Source Distance of Two Inches)*

	Temperature F. Before	After
Subcutaneous	94.5	111.0
Depth of 2 inches	97.8	103.3
Rectal	102.2	102.7

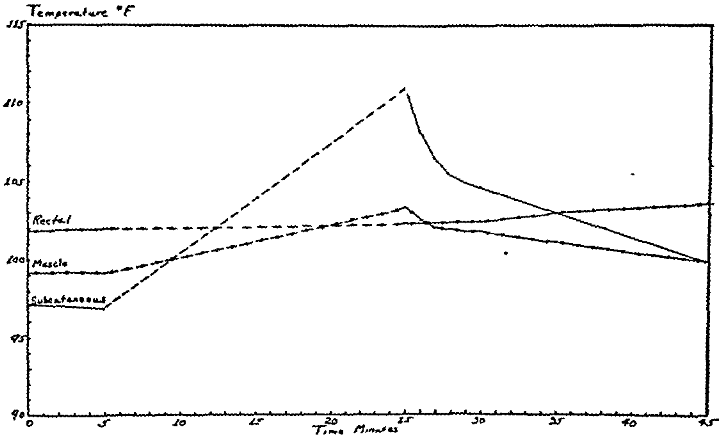

Fig. 2.—Typical cooling curves for subcutaneous tissue and muscle at a depth of 2 inches

2. *Eye of the Dog.*—The average temperatures of the vitreous body of the eye for seven acute experiments are recorded in table 5. The rectangular director was placed at a 2 inch (5.08 cm.) skin-source distance from

the eye. Treatment was given for a period of twenty minutes with the generator set for 60 to 80 per cent of maximum output. Figure 3 shows the cooling curve for the vitreous body.

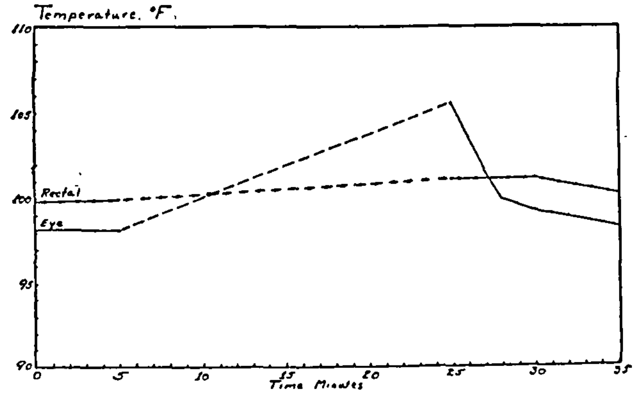

Fig. 3.—Typical cooling curve for the eye.

The left eye of 1 animal received six treatments. Inasmuch as the average final temperature of the acute eye experiments was 105.8 F., the assumption has been made that the final temperature of the chronic animal should be approximately 105.8 F. since all experiments were run under identical conditions. Following treatment there was no evidence of damage to the retina and no enlargement of the retinal vessels. There was increased redness of the conjunctiva, which disappeared a short time after cessation of treatment. There was no damage to tissues surrounding the eye in either acute or chronic dogs.

Table 5.—*Average Temperatures of Vitreous for Seven Acute Experiments (Rectangular Director at Skin-Source Distance of Two Inches)*

	Temperature F.		
	Before	After	Maximum
Vitreous body	98.8	105.8	112.2
Rectal	100.3	101.3	

3. *Frontal Sinus of the Dog.*—The average temperatures of the six experiments on the frontal sinus are found in table 6. The rectangular director was placed at a 2 inch (5.08 cm.) skin-source distance from the sinus. Figure 4 gives a typical cooling curve of the frontal sinus following treatment.

Table 6.—*Average Temperature of Frontal Sinus in Six Experiments (Rectangular Director at Skin-Source Distance of Two Inches)*

	Temperature F		
	Before	After	Maximum
Frontal sinus	95.1	105.1	106.9
Rectal	101.2	101.9	

4. *The Human Thigh.*—The average thigh temperatures for the six experiments performed on each of the 4 subjects were as follows: subject 1, 105.1 F.; subject 2, 103.5 F.; subject 3, 104.2 F., and subject 4, 103.9 F.

The average for the total of twenty-four experiments was 104.2 F. One experiment was terminated at ten minutes due to a pronounced erythema around the cannula. This was found to be due to moisture which had collected under the gauze covering the cannula. On subject 4 a superficial blister ½ inch (1.27 cm.) square was produced approximately 2 inches (5.08 cm.) from the cannula. Within the next ten days the blister dried and disappeared with no discomfort to the patient. In all experiments erythema was at a minimum when compared to the erythema produced by the usual short wave diathermy treatment.

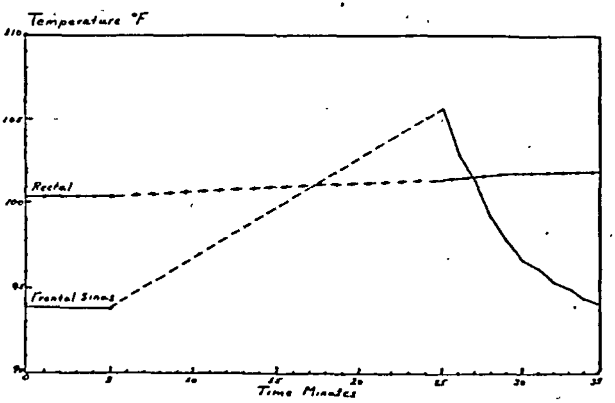

Fig. 4.—Typical cooling curve for the frontal sinus.

COMMENT

The question of ill effects from exposure to radar waves has been investigated by Lidman and Cohen,[1] Daily[2] and Fallis.[3] Lidman and Cohen could find no evidence of stimulation or depression of erythropoietic and leukopoietic systems of army personnel exposed to radiation from standard radar sets for periods ranging from a few months to nine years. Daily studied navy personnel who were exposed for several hours per day for periods up to nine years. He found no hematologic changes, no premature alopecia, no dermatologic manifestations and no clinical evidence of damage to reproductive tissues. Several subjects complained of headaches after exposure to radar waves for several hours. The headaches always disappeared spontaneously within one half to one hour after cessation of exposure. Fallis exposed guinea pigs to radiations from the air-borne unit, SCR-517, which has an output of 45 kilowatts. The animals were exposed for three hours daily for eight weeks at a distance of 2 feet (60.96 cm.). He noted no effect on appearance, growth, body temperature or reproduction and no histologic changes.

The microtherm unit used in our experiments has a maximum output of 125 watts. The output of the SCR-517 used by Fallis is three hundred and sixty times the maximum output of the microtherm. In contrast to the foregoing experiments we exposed local areas for twenty minute periods. In view of the evidence produced by these investigators it would seem *improbable that any ill effects should result from the limited exposure used in clinical practice.*

1. *Leg Muscles of the Dog.*—The heat produced in living animal tissues by exposure to high frequency radiations of 12 cm. wavelength has been studied by Krusen, Herrick, Leden and Wakim.[4] They recorded

temperatures of the skin surface, of subcutaneous tissue, of superficial (1.9 cm.) layer of muscle and deep (3 cm.) layer of muscle. In these experiments they have shown a positive temperature gradient from the skin surface to the deep layer of muscle. If radiations of this magnitude produce an increasing temperature from the surface to the deeper layers, a burn could occur in the deeper layers although the surface was quite unharmed.

On the other hand our experiments show a negative temperature gradient from the subcutaneous level to a depth of 2 inches (5.08 cm.) except in the one experiment cited. When the experiment was repeated and the animal was protected from the breeze, the final temperatures showed the usual negative gradient. In one other animal we observed in three successive experiments that the final temperature at a depth of 1½ inches (3.81 cm.) was greater than the final temperature at 1 inch (2.54 cm.). At autopsy it was found that the cannula at this depth was embedded in a mass of fat. In a report from the Raytheon Laboratories[5] it was shown that in nonliving tissue fat absorbs energy of this wavelength more readily than does lean meat. From this one experiment it appears that this might also hold true for living tissues. Further experimentation is definitely needed.

2. *Eye of the Dog.*—Puntenney and Osborne[6] used a 6 meter wave diathermy generator and applied the high frequency current by means of Schliephake glass electrodes to the eyes of experimental animals. They reported difficulty in localizing the heat solely to the eye without damage to the surrounding tissues. They also found a close relationship between the general body temperature and that of the eye during the heating and cooling periods.

Contrary to the results obtained by these investigators, no difficulty was encountered in focusing heat to the eye when the microtherm generator was used in our experiments. Contiguous tissues were not injured. In our animals the general body temperature was not increased in spite of the high vitreous temperatures secured. It would appear from our experiments that this method should be a safe and excellent means for the application of localized heat to the eye.

3. *The Frontal Sinus of the Dog.*—Andreen and Osborne[7] measured temperature of the maxillary sinus of human subjects using, among other methods of heating, the high frequency current. They used both conventional diathermy and induction heating. The highest temperature reported by them after a twenty minute exposure was 99.1 F., a rise of approximately 0.9 degree Fahrenheit. Our experiments on the frontal sinus of the dog showed for the total experiments an average temperature elevation to 105.1 F. In 1 instance a temperature of 106.9 F. was secured. This radiation should be used, therefore, to see whether these rises in temperature can be duplicated in the maxillary sinus of the human subject. At present we have no other means of heating this region of the head.

4. *Heating of the Human Thigh.*—These are the first experiments to be reported giving the internal temperature of the human thigh at a depth of approximately 2 inches (5.08 cm.) following exposure to radiation of 12 cm. wavelength. Our experiments show that a temperature of 104.2 F. can be secured at a depth of 2 inches (5.08 cm.) in the human thigh by means of the microtherm diathermy generator. This meets the heating requirements of the Council on Physical Medicine of the American Medical Association. Heat sensation on the surface is not pronounced. Erythema is at a minimum and generally much less than that noted with the usual short wave diathermy treatment. It must not be lost sight of, however, that these two criteria have been a safety factor for adequate dosage. Thus, in careless hands heating by this method might be dangerous. Our animal experiments show that the heat decreases from the superficial to the deeper tissues, but this temperature gradient is not as steep as in the short wave diathermy. Krusen, Herrick, Leden and Wakim in their animal experiments show a reversal of the temperature gradient. Further investigation of this factor should be undertaken. A disadvantage of this new method of tissue heating, in our opinion, is its definite localization. In all our experiments it will be noted that body temperature undergoes little change. There has been a gradually growing appreciation that diathermy is more effective when large areas, such as an entire limb, are heated rather than a definite localized area. By this large area technic the circulation of an entire limb can be influenced, and, if dosage of radiation is low, an active hyperemia is secured and passive congestion avoided. At present it is not possible to heat large areas of the body with the microtherm because of the limited size and shape of the directors in use. This would seem to be a distinct disadvantage.

SUMMARY

1. Microwave (radar) radiations were applied to the thighs of dogs, and temperature measurements made subcutaneously and at ½ inch (1.27 cm.) intervals to a depth of 2 inches (5.08 cm.). Following exposure to high frequency energy the maximum temperature was observed in the subcutaneous level and decreasing temperatures were found with increasing depth. The average temperature at a depth of 2 inches (5.08 cm.) in ten experiments using the 6 inch (15.24 cm.) hemispherical director at a spacing of 1 inch (2.54 cm.) from the skin surface was 104.1 F. (40.1 C.).

2. In seven "acute" experiments on dogs the eye was exposed to microwave radiations. The average temperature of the vitreous body following microwave treatment was 105.8 F. (41 C.). One animal received a series of six treatments over a period of three weeks. There was no evidence of damage to the eyes or contiguous tissues.

3. Six experiments were performed in which the frontal sinus of the dog was exposed to microwave radiations. The average of the temperatures of the frontal sinus following exposure to the microwave was 105.1 F. (40.6 C.).

4. In twenty-four experiments on human subjects the thigh was exposed to microwave radiation. The average temperature at a depth of approximately 2 inches (5.08 cm.) immediately following microwave irradiation was 104.2 F. (40.1 C.). One small superficial blister was produced. By the tenth day the blister had disappeared. The treatments were comfortable to the

patients, and a minimum of erythema was noted. Microwave treatment should be applied cautiously because the minimum of erythema and discomfort to the patient gives the operator less warning of overheating. The limitations of localized heating by this method have been indicated.

ARTEE CURETTE ACCEPTABLE

Manufacturer: Artee Products Company, Box 3974, Cleveland 20.

The Artee Curette is a small instrument intended for use in removing foreign bodies from the surface of the eye. It was formerly called the Professional Safe Eye Snare. It consists of a cylindric middle portion with a magnet at one end and a wire loop at the other; the two ends are capped with metal screwtops, of which one bears a clip to hold it in the pocket like the clip on a mechanical pencil. The over-all length of the instrument is 11.7 cm. (4.6 inches), and the diameter is slightly less than 1 cm. (0.4 inch). The magnet is stated to be made of "alnico V." The rest of the instrument, including the wire, is stated to be made of stainless steel. It is stated that the loop is made of flexible wire 0.005 inch (0.13 mm.) in diameter which has been drawn through diamond dies to give it a highly polished mirror finish.

GENERAL AUTOMATIC ELECTRICALLY COOLED OXYGEN TENT ACCEPTABLE

Manufacturer: General Hospital Supply Service, 256 West 69th Street, New York 23.

The General Automatic Electrically Cooled Oxygen Tent consists essentially of two parts, a transparent canopy suspended over the upper part of the patient's body and a cabinet, mounted on casters, through which the oxygen from a supply tank passes into the canopy. The cabinet contains the electrical apparatus, which includes a sealed, self-lubricating compressor and uses 4½ amperes on a 110-115 volt 60 cycle alternating current. A direct current unit is furnished at an extra charge, and special compressors can also be furnished. The cabinet without canopy and hangers weighs from 89 to 91 Kg. (196 to 200 pounds). The shipping weight including canopy and hanger varies from 117 to 136 Kg. (257 to 300 pounds) depending on the material used for crating.

When tested for inflammability, the canopy was found not to maintain combustion in air. In 60 per cent oxygen it burned brightly, but there was no "flash fire." Users of oxygen tents should remember that bedclothes (cellulose being a carbohydrate) burn viciously in oxygen and are as important in a consideration of fire hazards as are the materials of the tent. Oils must not be used for any purpose in connection with oxygen apparatus; this applies not only to lubricating oils for the machinery but also to oils that might be applied to the skin of the patient and might rub off on the bedclothes.

I.E.C. NEBULIZER ACCEPTABLE

Manufacturer: Inhalational Equipment Co., Inc., 248 East 119th Street, New York 35.

The I.E.C. Nebulizer is a device made of blown "pyrex" glass, equipped with a rubber pressure bulb and designed to convert aqueous solutions into a fine air-borne mist or nebula. This nebulizer is specifically designed for administering penicillin, streptomycin, sulfathiazole, epinephrine and similar drugs by inhalation as aerosols. It produces a uniformly fine mist of microscopic particles and is made with a U-shaped bend that acts to baffle large particles, allowing only the particles of microscopic size to pass through the nebulizer.

LANTEEN FLAT SPRING MENSINGA TYPE DIAPHRAGM ACCEPTABLE

Manufacturer: Lanteen Medical Laboratories, Inc., 900 North Franklin Street, Chicago 10.

The Lanteen flat spring Mensinga type diaphragms are available in 2.5 mm. gradations from 50 to 95 mm. Each package contains one diaphragm and a tube of "Lanteen jelly," with applicator. The flat (watch-spring) type of spring imposes certain limitations on the direction in which the ring can be bent. The diaphragm is designed to be put into place without a special inserter.

The Council accepts the Lanteen Flat Spring Mensinga Type Diaphragm with the understanding that the contraceptive jelly will be omitted from the package or until such time as the latter is accepted by the Council on Pharmacy and Chemistry.

I.E.C. NEBULIZER FOR PENICILLIN AEROSOL ACCEPTABLE

Manufacturer: Inhalational Equipment Co., Inc., 248 East 119th Street, New York 35.

The I.E.C. Nebulizer for Penicillin Aerosol incorporates the inhalational nebulizer which has been accepted by the Council on Physical Medicine. The entire equipment includes a rebreathing bag, a Y tube, a water bottle and an attachment for an oxygen tank. The nebulizer is connected with an oxygen tank, which supplies both the gas and the pressure needed to make the nebulizer work. The rebreathing bag is intended to prevent waste of the penicillin, and there is the possibility of further saving in the suggested use of an arrangement for producing the aerosol during the inspiratory cycle only. The rebreathing bag has a capacity of 2,500 cc. The nebulizer is connected to an oxygen cylinder which is used to nebulize the solution at a flow of from 6 to 8 liters per minute.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., *Secretary.*

ESTROGENIC SUBSTANCES (WATER INSOLUBLE) (See New and Nonofficial Remedies 1947, p. 343).

The following dosage form has been accepted:

E.R. SQUIBB & SONS, NEW YORK

Pessaries Amniotin: 2,000 and 5,000 I.U. Each pessary contains sufficient estrogenic substances (water insoluble) in corn oil to provide the stated unitage expressed in terms of estrone, enclosed in a soft gelatin capsule for use as a vaginal suppository.

MEPERIDINE HYDROCHLORIDE (See New and Nonofficial Remedies 1947, p. 28).

The following dosage forms have been accepted:

WINTHROP-STEARNS, INC., NEW YORK

Demerol Hydrochloride (Powder): 15 Gm. vials.

Solution Demerol Hydrochloride: 50 mg. per cc., 30 cc. vials.

HEXESTROL (See New and Nonofficial Remedies 1947, p. 353).

The following dosage form has been accepted:

S.E. MASSENGILL CO., BRISTOL, TENN.

Tablets Hexestrol: 3 mg.

PHENOBARBITAL SODIUM-U.S.P. (See New and Nonofficial Remedies 1947, p. 418).

The following dosage form has been accepted:

THE WM. S. MERRELL CO., CINCINNATI

Solution Phenobarbital Sodium with Benzyl Alcohol 2% in Propylene Glycol 70%: 0.12 Gm. and 0.3 Gm., 2 cc. ampuls.

STREPTOMYCIN (See New and Nonofficial Remedies 1947, p. 150).

The following dosage form has been accepted:

THE WM. S. MERRELL CO., CINCINNATI

Streptomycin Calcium Chloride Complex: 1.3 Gm., 20 cc. vials. 1.3 Gm. of Streptomycin Calcium Chloride Complex equivalent to 1.0 Gm. of Streptomycin base.

BLOOD GROUP SPECIFIC SUBSTANCES A AND B.—A sterile solution of polysaccharide-amino acid complexes, capable of reducing the titer of the anti-A and anti-B isoagglutinins of group O donor blood. Blood group specific substance A is isolated as a precipitate from a tryptic digest of hog gastric mucin. Group specific substance B is isolated as a precipitate from a tryptic digest of the glandular portion of horse gastric mucosa

Actions and Uses.—Blood Group Specific Substances A and B, when added to group O blood renders the latter safe for transfusion into patients having other blood groups. While this eliminates reaction attributable to the corresponding isoagglutinins, it should be kept in mind that group O blood may continue to give rise to reactions due to pyrogens, Rh incompatibility and immunologic unknowns.

Dosage.—Blood Group Specific Substances A and B may be added to group O blood just prior to administration or at the time of collection and storage. One transfusion unit (10 cc.) is capable of reducing the anti-B and anti-B isoagglutinin titer of 500 cc. of group O blood to at least one fourth of its original titer.

SHARP & DOHME, INC., PHILADELPHIA

Blood Group Specific Substances A and B: 10 cc. vials. Preserved with phenol 3%.

U.S. Patent reissue 22208 (Expiration Date July 14, 1959).

NORMAL HUMAN SERUM ALBUMIN.—The albumin fraction of normal adult human plasma. The finished product contains 25 per cent of albumin and not more than 0.33 per cent of sodium. It complies with the minimum requirements of the National Institute of Health for serum albumin and conforms to the specifications of the Commission on Plasma Fractionation.

Actions and Uses.—To reduce edema and raise the serum protein level in hypoproteinemia; also used in the treatment of shock.

Dosage.—Approximately 1 cc. per pound of body weight given at a rate not greater than 2 cc. per minute, usually to be accompanied by isotonic sodium chloride solution or 5 per cent dextrose.

CUTTER LABORATORIES, BERKELEY, CALIF.

Normal Human Serum Albumin (Salt-Poor) 25 per cent: 20 cc. bottles, containing 5 Gm. of albumin with not more than 0.33 per cent of sodium in a buffered diluent, osmotically equivalent to 100 cc. of plasma. No preservative added.

Licensed by Research Corporation. U.S. Patent 2,390,074.

DIGITOXIN—U.S.P. (See New and Nonofficial Remedies 1947, p. 248).

The following dosage form has been accepted:

THE CENTRAL PHARMACAL COMPANY, SEYMOUR, IND.

Tablets Digotoxin; 0.2 mg.

PERTUSSIS VACCINE COMBINED WITH DIPHTHERIA AND TETANUS TOXOIDS (See New and Nonofficial Remedies 1947, p. 460).

The following dosage form has been accepted:

E. R. SQUIBB & SONS, NEW YORK.

Diphtheria and Tetanus Toxoid Alum Precipitated and Pertussis Vaccine Combined: 1.5 cc. (one 3 dose immunization) and 7.5 cc. vials (five 3 dose immunizations). Preserved with sodium ethyl mercuri thiosalicylate 1:10,000.

PROTEIN AND AMINO ACID PREPARATIONS (See THE JOURNAL, March 6, 1948 p. 691).

The following dosage form has been accepted:

INTERCHEMICAL CORPORATION, UNION, N. J.

Solution Elamine: 5%, 60 Gm. bottles. A modified protein hydrolysate prepared by acid digestion of casein and supplemented with dl tryptophane.

U.S. patent pending.

BENZALKONIUM CHLORIDE—U.S.P. (See New and Nonofficial Remedies 1947, p. 59).

The following dosage form has been accepted:

WINTHROP STEARNS, INC., NEW YORK.

Solution Zephiran Chloride: 1:1,000; 14.8 cc. bottles.

TESTOSTERONE PROPIONATE—U.S.P. (See New and Nonofficial Remedies 1947 p 377)

The following additional dosage form has been accepted:

RARE CHEMICALS, INC , HARRISON N. J.

Testosterone Propionate· 25 mg. 10 cc. vials; 50 mg., 6 cc vials

METYCAINE HYDROCHLORIDE (See New and Nonofficial Remedies 1947 p. 49)

The following additional dosage forms have been accepted:

ELI LILLY & CO., INDIANAPOLIS.

Solution Metycaine Hydrochloride in Ringer's Solution *(For Spinal Anesthesia)*: 1 5 per cent, 5 cc and 20 cc ampuls; 2 per cent, 30 cc. vials; 5 per cent, 3 cc. ampuls.

Metycaine Hydrochloride *(Powder)*: 15 Gm. and 120 Gm. bottles.

TRIMETHADIONE (See New and Nonofficial Remedies 1947 p. 401).

The following additional dosage forms have been accepted:

ABBOTT LABORATORIES, NORTH CHICAGO ILL.

Dulcet Tablets Tridione: 0.15 Gm.

U. S. trademark 301,662.

Solution Tridione: 500 cc. and 4,000 cc. bottles.

EDITORIAL ANNOUNCEMENT

The compositors returned to work on Monday, June 28. This issue of The Journal has been prepared in part by the use of Veri-Typer machines.

ABDOMINAL EPILEPSY

Experimental and clinical observations have demonstrated the existence of cortical representation of autonomic function and of abdominal sensations produced by cortical stimulation. Watts and Fulton[1] produced experimental diencephalic lesions which resulted in disturbed gastrointestinal activity. The probable role of the diencephalon in the production of peptic ulcer following brain trauma was emphasized by Cushing. Penfield and Gage[2] exposed the brain of a patient under local anesthesia and stimulated electrically an area just posterior to the postcentral convolution. The patient complained of a pain in the right abdominal quadrant like that experienced before her epileptic attacks. Faradic stimulation in front of this area reproduced what for her was a typical seizure. Winkelman[3] cited the case of a man who experienced intense abdominal pain as the initial symptom of a cerebral hemorrhage involving the frontoparietal area. Klingman[4] and his co-workers reported observations on 12 children with paroxysmal attacks of abdominal pain. The electroencephalographic anomalies in all these were suggestive of cerebral dysrhythmia. In 9 of the children neurologic symptoms consistent with convulsive disorder have since developed. Some of them have been free of symptoms under anticonvulsant therapy.

Moore[5] defined abdominal epilepsy as a disorder characterized by bouts of paroxysmal abdominal pain, the latter being due to hypermotility of the bowel, provoked by abnormal discharges of certain neurons in the vicinity of biochemically or structurally altered cerebral tissue, presumably situated in the premotor and postmotor cerebral cortex and/or the diencephalon. The underlying morphologic structural changes which may produce abdominal epilepsy are no different from those causing any of the other forms of generally accepted epilepsy. In a study of 14 cases of abdominal epilepsy by Moore about one half of the patients had a history of brain injury as a suggestive, and in some cases as an undoubted, relationship to the onset of abnormal cerebral discharges and the symptoms of paroxysmal abdominal pain. The majority of these patients had been treated for a variety of abdominal conditions. Some had one or more futile abdominal operations or equally futile treatment for psychoneurosis. The great majority of these patients obtained relief from anticonvulsant therapy.

Moore[6] emphasized the need for recognition of unexplained paroxysmal abdominal pain, when study of the abdominal viscera has been negative, as being possibly of cerebral origin due to abnormal discharges arising in the premotor or parietal regions.

The criteria for diagnosis are based on (1) exclusion of intrinsic visceral disease, (2) adequate historical data, (3) attack pattern of an epileptic order, (4) associated epileptic show, (5) objective evidence of cerebral organic disease or dysfunction and (6) effect of anticonvulsant drugs on the symptom of abdominal pain and on the electroencephalogram.

RABIES

During the last week in June 1948, Texas reported 23 cases of rabies in animals; Kentucky reported 11 cases and Indiana 9 cases. Of thirty-nine states making such reports to the United States Public Health Service, eighteen did not report cases. One human case was reported in Georgia.

From its foundation in 1907 through 1946 the Pasteur Institute of Southern India at Conoor[1] has given antirabic treatment to 40,421 patients bitten or scratched by rabid animals, mostly, of course, dogs. Of these patients 402 subsequently died of rabies, a death rate of 0.99 per cent. Since 1922 many subsidiary centers for antirabic treatment have been opened. From 1922 through 1946, some 208,481 patients received antirabic treatment at these centers; of these patients 716 died of rabies, a death rate of 0.34 per cent. During 1946, patients treated at the Institute were 402, with 2 deaths, and 19,922 patients were treated at subsidiary centers with 11 deaths (0.08 per cent). The biting animals in these 11 fatal cases were dogs in 9 and jackals in 2. The animals involved in all the fatal cases since 1908 are, in the order of frequency, dog (95.60 per cent), jackal, fox, wild dog, leopard, cat, sheep.

[1] Annual Report of the Director of the Pasteur Institute of Southern India, Conoor, 1946-1947, Madras, 1947.

Dogs are the main reservoir of rabies. As yet the practical control of canine rabies is far from effective except in countries which prevent the import of dogs unless after quarantine long enough to exclude rabies. Rabies in dogs appears to be increasing in some places. According to newspaper statements rabies in dogs in the suburban part of Cook County, Illinois, in which Chicago is located, is spreading as judged by the number of rabid dogs killed by the police. And we know that rabies in the fox is now well established in many states.[2] There continues to be urgent need for more and more active cooperatively coordinated preventive measures against rabies in dogs as well as other animals.[3]

Absolute safety from human rabies requires that the entire dog population of a community must be kept free from rabies at all times. Better means are needed to determine whether a given animal is or is not infected with rabies. This need of early reliable diagnosis applies especially to human beings exposed to possible rabies, so that more may be learned about the specific results of the antirabic treatment. At present all that usually can be determined is whether or not the biting or scratching animal had rabic infection. Finally, there is the unsolved problem of effective treatment of established rabies. Rabies should not be neglected in the testing of new antibiotics. These are problems that call for the best research that can be provided by public and private agencies. These needs have a special claim on dog lovers. Is it too much to expect of the antivivisectionists that they will not neglect the chance offered by research on rabies to help dogs and other animals?

MORE SILLY NAMES FOR PENICILLIN PRODUCTS

In February 1946 The Journal called attention editorially to a great variety of names for penicillin that had been introduced by manufacturers and purveyors. So many names had been offered that they seemed designed to conceal rather than reveal the nature of the product. Now come other titles that fail to indicate the nature of the product but which suggest the section of the body, or the animal, at which they are aimed, or that are otherwise as ridiculous. Here are a few samples from recent lists:

Buffecillin (Pfizer)
Crysticillin (Squibb)
Dairycillin (Schenley)
Duracillin (Lilly)
Flo-Cillin (Bristol Laboratories)
Gelu-Cillin (Warner)
Hypercillin (Cutter)
Intracillin (Warner)
Par-Pen (Smith, Kline & French)
Pecticillin (Pfizer)
Pelvicin (Schenley)
Pen-Troche (Cutter)
P. O. B. (Cutter)
Poultrycillin (Schenley)
Powdalator (Abbott)
Wycillin (Wyeth)
Capicillin (Barron Chemical Corp.)
Denticillin (Marlo Laboratories)
Nasocillin (Mol-La Laboratories)
Ophtocillin (Marlo Laboratories)
Rectocillin (Mol-La Laboratories)
Salvacillin (Barron Chemical Corp.)
Tablicillin (Barron Chemical Corp.)
Trochicillin (Marlo Laboratories)
Vagicillin (Marlo Laboratories)

To select a rose from such a garden would require a botanist with more basic knowledge of the naming of plants than most physicians possess. Perhaps the blue ribbon should go to either "Poultrycillin" or Vagicillin." Perhaps the next step will be numbers to correspond with certain entrances or exits of the human body; we may be talking about "cillin no. 1" for the front and "cillin no. 2" for the rear. In a previous editorial attention was called to the combination of the manufacturer's name with "cillin." Since there were almost thirty manufacturers, that offered almost thirty possibilities. Now the emphasis seems to be inclining toward the port of entry plus "cillin." The Council on Pharmacy and Chemistry in recent years has tried to be more than reasonable about the acceptance of fanciful names for widely used products of varying manufacture. Even the patience of the proverbial Job would be tried by contemplation of a list such as is here cited. In the previous editorial the editor offered 8 to 5 that doctors would not guess the nature of a product called "Penioral." The odds are improving. We now offer 5 to 1 on "P. O. B."

Current Comment

SCHOOL HEALTH COMMITTEES

Every school, regardless of size or location, has numerous health problems which it must solve to the satisfaction of its local community. Teachers must realize the health status of the children in order to fit the educational program to the individual child's needs and capabilities. Teachers of physical education must know which children have cardiac lesions, hernias and recurrently dislocating joints if exercise is to be safely used. Medical examination obviously must be provided for all school children--but how, at what frequency and by whom?

School authorities are obviously in need of carefully considered medical advice; where shall they obtain it ? The report of the recent Conference on the Cooperation of the Physician in the School Health and Physical Education Program[1] suggests that each local medical society appoint a School Health Committee to represent its membership in working with the local school authorities. A generally acceptable four point school health

program including health service, health instruction, healthful school living and the health aspects of physical education has been developed through the combined efforts of forty-five health and educational organizations.[2] School administrators have expressed themselves as in general agreement with the purposes of their program.[3] Apparently the schools are entering a period of rapid development of their health programs. As this development takes place, local medical societies must be prepared to provide through their School Health Committees the consultation and advice that will be requested.

ALLERGIC CARDITIS

In 1932 Vaubel[1] and Kling[2] reported that in rabbits subjected to sublethal anaphylactic shock there develop cardiac lesions resembling those seen in human, rheumatic fever. This observation was afterward confirmed by Hall and Anderson[3] Rich and Gregory[4] and others, who formulated the theory that rheumatic fever is a reaction to parenteral contact with foreign protein to which tissues previously had been sensitized. This theory has been further supported by Moore[5] and his associates of the University of Southern California, who report the production of "rheumatic-like carditis" in mice subjected to repeated injection with egg albumin. In a typical experiment young mice received three intraperitoneal injections of dilute egg white at two day intervals, followed from four to twenty-one days later by a fourth injection of a smaller dose given intravenously. The surviving animals were held for seven days, then killed and their hearts fixed in solution of formaldehyde. Serial sections of these surviving hearts showed numerous rheumatic-like lesions, such as focal areas of acute vascular and perivascular degeneration, complete fibroid degenerations of arteriolar walls, hydropic degeneration and disruption of myocardial fibrils, perivascular cellular infiltrations and frequent verrucous lesions of the mitral surfaces with an occasional pathologic fusion of the aortic cusps. There was no apparent relation between the severity of clinical anaphylaxis and the extent or severity of these cardiac lesions. The allergic cardiac lesions thus bear a striking resemblance to the lesions that occur in acute human rheumatic carditis. Work of Moore and associates thus supports the theory that the human rheumatic heart is a result of parenteral contact with foreign proteins to which the cardiac tissues have been previously sensitized. They believe that this is compatible with the known relation of the streptococcus to rheumatic carditis, since it would be difficult to find a better source of foreign (or denatured) protein than the streptococcus frequently or intermittently gaining admission to the cardiac tissues.

ACUTE POTASSIUM DEFICIENCY IN DIABETIC ACIDOSIS

Several recent clinical studies[1] have demonstrated that diabetic acidosis, particularly after insulin therapy, may be complicated by *an acute potassium deficiency*. The evidence for such a significant conclusion is the consistent observation of a low serum potassium concentration in this condition and a favorable, almost dramatic, response of the acidotic patients to administered potassium chloride. Further supporting evidence is found in the general symptoms shown by the patients, such as paralysis of voluntary muscles, respiratory distress and electrocardographic abnormalities. These symptoms have been observed also in chronic potassium deficiency in experimental animals.[2] The prompt and decided improvement of the insulin-treated patient given potassium therapy has led one group of investigators[1c] to note that " the changes (respiratory distress, altered electrocardiogram, 'shock,' etc.) are due not to a low blood sugar level, as has sometimes been assumed, but to a shift of potassium from extracellular to intracellular space...". The fundamental reason for and acute potassium deficiency in diabetic acidosis is not completly understood, but a number of suggestions have been made.[1] One view is that a renal loss of potassium associated with the diuresis, particularly after insulin is administered, is a primary contributory factor to the acute depletion of potassium. Such a conception is perhaps supported by the observa-

tion of a potassium deficiency in chronic nephritis[3] as indicated by a low serum potassium values, flaccid paralysis, abnormal electrocardiograms and a prompt response to potassium chloride therapy. Another view is that there is a shift of potassium from the extracellular to intracellular fluid, a view which receives some support from a current critical study[4] of exchanges of potassium and sodium in patients with various conditions, including familial periodic paralysis, a condition also characterized by aberrations in the metabolic disposition of potassium. The Yale investigators reached the general conclusion that in experimental and clinical conditions in which there is dehydration, as may occur in diabetic acidosis and chronic nephritis, there is usually a transfer of potassium from the extracellelar to intracellular fluids to replace losses in the latter as a result of renal excretion or possibly for other reasons. Such a concept would appear to explain satisfactorily the low serum potassium values and consequent physical symptoms seen in some cases of diabetic acidosis, chronic nephritis and familial periodic paralysis. The general concept that human deficiency diseases may sometimes be endogenous in origin rather than due to the classical exogenous or dietary lack of essential substances is emphasized by the foregoing studies.

CORRECTIVE TRAINING OF COLOR BLINDNESS

Farnsworth[1] has estimated that there are 5,000,000 men in the United States partially or completely color blind, many engaged in transportation, the arts and crafts of interior decorating, printing, painting, textiles and color reproduction. The benefit to these men if it were possible to remedy or mitigate their deficiencies in detecting colors would be incalculable. The business of controlling color blindness, or rather of ''coaching'' men to pass tests, assumed considerable proportions during World War II. The methods practiced included repeated observation of bright colors; subcutaneous injection of iodine; electrical stimulation of the eyeball; warming of one eye; making of color judgments; observation of red and green lights; viewing dazzling lights of various colors; dosage with extremely large quantities of vitamins, chiefly various preparations of vitamin A with stress on emulsification; injection of cobra venom; repeated coaching on pseudoisochromatic plates or other color blindness tests; continuous wearing of glasses tinted with the color of the presumed deficiency. The National Bureau of Standards, U. S. Department of Commerce, reports that what actually happens when a person with anomalous vision receives training of various kinds is progressive familiarization with the particular type of pseudoisochromatic chart used to gage his progress. Repeated efforts to read the charts create the opportunity for practice and cut down the time required. Red-green deficiency is fairly prevalent among healthy men; about 8 per cent have this defect from birth to an important degree. A red-green confuser may fail to notice the color of a red signal or from a distance may be unable to tell forest land from plowed land. The lives of a whole crew of a bomber or submarine may be the price to pay for the delusion of one crew member that his color vision is normal just because he took treatments and learned to pass a color vision test. The Inter-Society Color Council Subcommittee in its report to the American Medical Association states that reliable scientific evidence indicates that the majority of persons with deviation from normal color vision possess some congenital retinal or neural defect which neither diet nor drugs, nor training in perceptual discrimination, can remedy. No crucial role in passing the tests in current use is played either by facility in the use of color names or by degree of familiarity with the various color tones, both stressed by the " corrective" color trainers. Prolonged study of the color charts of the test, however, enables the applicant to memorize digit series, familiarize himself with certain clues and tricks of composition or utilize certain aids in viewing. Thus, without materially improving his general color ability he may pass the qualifying test on retrials. In the interest, therefore, both of society and of the individual, a false rating of whose abilities can in the end work only injury to his prospects, the council condemns any training systems of the color blind which claim to be corrective. The Association of Schools and Colleges of Optometry in a resolution passed June 22, 1947 likewise condemned so-called " corrective training of color vision defects." Farnsworth emphasized that the experimental data on the subject lead to the conclusion that the basic psychophysiologic functions, as indicated by luminosity curves, color mixture ratios and other stimulus data by which normal or defective color vision is described, are unaffected by medicine, training or other therapy. The consensus, therefore, among the best informed and most experienced specialists in the field of color vision is that congenital color deficiency cannot be remedied by the use of diet, medicine, training or any other treatment known to science.

ORGANIZATION SECTION

PROCEEDINGS OF THE CHICAGO SESSION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN CHICAGO, JUNE 21-25, 1948

HOUSE OF DELEGATES

Thursday Afternoon—Continued

ELECTION OF OFFICERS

Report of Reference Committee on Rules and Order of Business

Dr. H. P. Ramsey, Chairman, presented the following report:

This is nearly all a repetition of what was said to the House yesterday in response to an inquiry. I direct your attention again to your Handbook, pages 38, 39 and 40, covering conduct of the elections. On page 40, item 8 reads "Roll Call for Casting Ballots." At that time, all three ballots are to be cast. Now, if you will turn back to page 38, "Election of Officers," you will find thereafter certain references to white, blue and yellow ballots, specimens of which are here.

The Secretary will place the blackboard in the center where nominations as made may be recorded in your full view. At the conclusion of the nominations for each office the Speaker will so declare. At the conclusion of all of the nominations or items for the white ballot, the Speaker will declare that nominations have been made for all of the offices on the white ballot.

The same procedure will be followed in respect to the blue ballot and to the yellow ballot, all of which will be cast at the same time, at the time of a roll call of the House. You will observe that a ballot box with a glass front has been mounted on the far side of the auditorium and that, as you pass to drop your ballots, you will fold them letterwise and deposit each ballot separately so that the tellers in attendance may note that you have dropped one of each color.

Furthermore, there will be no blackboard tally. The Chair has been requested to augment the Tellers' Committee by six. There are now three, and that will make nine. The Tellers' Committee will subdivide itself into three subcommittees one subcommittee for each color ballot, to expedite the work of counting the ballots. When they are through, the Speaker will call for their report.

Dr. E. Vincent Askey, California, stated that there is one clarification which might be made, that is that if there are three or more nominations for any office, the By-Laws state that the lowest man shall drop out and another ballot be cast until a majority is won; that unless that is understood it is quite possible that there may be three men voted on and then the final vote which would have to be taken might result in half of the delegates having gone, thinking they had cast their ballot, and that it is important that it is understood that the ballot and voting is not final until the result of the Tellers' count is in because another ballot might be necessary.

Dr. Ramsey added that Dr. Askey was correct; that yesterday he had stated that in case of any run-off ballots, plain pieces of paper would be distributed by the Secretary for any such possible run-off ballots, and that a copy of each of the three ballot sheets would be distributed at the same time.

The Speaker appointed the following extra tellers as suggested by the committee: To assist Dr. Green, Chairman of the Tellers, Dr. James Q. Graves, Louisiana, and Dr. Gerald V. Caughlan, Iowa; to assist Dr. Samuel, another member of the Tellers' Committee, Dr. Clark Bailey, Kentucky, and Dr. E. P. McNamee, Ohio, and to assist Dr. Smith, the other Teller, Dr. A. S. Giordano, Indiana, and Dr. George A. Unfug, Colorado. The Speaker requested all voting delegates to move into the section reserved for voting delegates in order to facilitate matters in passing and collecting ballots, and further requested all others to take seats in the back of the hall, after which the ballots were distributed, a white, a blue and a yellow ballot being given each voting member of the House.

Dr. H. P. Ramsey, Chairman of the Reference Committee on Rules and Order of Business, stated that if there should be only one nominee it is possible or desirable that the nominee be elected by acclamation without the necessity for a teller count.

Nominations for President-Elect

Dr. Charles H. Phifer, Illinois, nominated for President-Elect Dr. Ernest E. Irons, Chicago, and the nomination was seconded by delegates from Alabama, Illinois, Tennessee, Mississippi, Iowa, Pennsylvania, Georgia, New Jersey, South Carolina and others.

Dr. W. A. Coventry, Minnesota, nominated for President-Elect Dr. A. W. Adson, Rochester, Minn., and the nomination was seconded by delegates from Wisconsin, the Section on Nervous and Mental Diseases, California, the Section on Laryngology, Otology and Rhinology, South Dakota, Illinois, Ohio, Oklahoma, Colorado, New Jersey, Michigan, South Dakota and others.

On motion of Dr. A. A. Walker, Alabama, seconded by several and carried, nominations for President-Elect were closed.

Nomination for Vice President

The Vice Speaker presided.

Dr. K. S. J. Hohlen, Nebraska, nominated Dr. Roy W. Fouts, Omaha, as Vice President, and the nomination was seconded by delegates from practically every state. Dr. Arthur J. Bedell, Section on Ophthalmology, moved that the nominations be closed, and the motion was seconded and carried.

On motion of Dr. Lowell S. Goin, California, seconded by Dr. James C. Sargent, Wisconsin, and carried, the Secretary cast the ballot of the House for Dr. Roy W. Fouts as Vice President, and the Vice Speaker declared Dr. Fouts duly elected to that office for one year.

Nomination for Secretary

The Speaker resumed the Chair.

Dr. A. A. Walker, Alabama, nominated Dr. George F. Lull, Chicago, as Secretary, and the nomination was seconded by delegates from practically every state.

On motion of Dr. William Weston, Section on Pediatrics, seconded by Dr. Mather Pfeiffenberger, Illinois, and carried, nominations for Secretary were closed.

It was moved by Dr. James C. Sargent, Wisconsin, seconded by Dr. Robert H. Hayes, Illinois, and carried, that Dr. F. F. Borzell, Vice Speaker, cast the ballot of the House for Dr. Lull as Secretary.

The Vice Speaker cast the ballot of the House for Dr. George F. Lull, Chicago, to serve as Secretary for a term of one year.

Nomination for Treasurer

Dr. E. L. Henderson, Chairman, Board of Trustees, nominated for Treasurer Dr. J. J. Moore, Chicago, and the nomination was seconded by many. Dr. Robert H. Hayes, Illinois, moved that nominations be closed, and the motion was seconded and carried.

The Secretary cast the vote of the House for Dr. J. J. Moore, Chicago, as Treasurer for one year, on motion of Dr. Mather Pfeiffenberger, Illinois, seconded by Dr. Robert H. Hayes, Illinois, and carried.

Nomination for Speaker of House of Delegates

Dr. W. L. Estes Jr., Pennsylvania, nominated for Speaker of the House of Delegates Dr. F. F. Borzell, Philadelphia, and the nomination was generally seconded. It was moved by Dr. Val H. Fuchs, Louisiana, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, that nominations be closed.

On motion of Dr. B. R. Kirklin, Section on Radiology, seconded by several and carried, the Speaker cast the ballot of the House for Dr. F. F. Borzell, Philadelphia, as Speaker of the House of Delegates for one year.

Nominations for Vice Speaker of House of Delegates

Dr. Thomas P. Murdock, Connecticut, nominated for Vice Speaker of the House of Delegates Dr. Creighton Barker, New Haven, Conn., and many seconded the nomination.

Dr. John J. Masterson, New York, nominated for Vice Speaker Dr. James R. Reuling, Bayside, N. Y.

Dr. H. B. Everett, Tennessee, moved that nominations be closed and the motion was seconded by several and carried.

The Speaker declared that this completed the nominations for the offices on the white ballot and that it would be necessary to vote only for the President-Elect and the Vice Speaker of the House of Delegates.

Nominations for Trustee to Succeed Dr. William F. Braasch

Dr. Walter F. Donaldson, Pennsylvania, nominated Dr. Louis A. Buie, Rochester, Minn., to succeed Dr. William F. Braasch, Rochester, Minn., as Trustee, and the nomination was seconded by several.

Dr. Robert E. Schlueter, Missouri, nominated Dr. James R. McVay, Kansas City, Mo., for that office.

Dr. James C. Sargent, Wisconsin, nominated Dr. Gunnar Gundersen, La Crosse, Wis., for that office, and the nomination was duly seconded.

Dr. Arthur J. Bedell, Section on Ophthalmology, moved, and Dr. H. B. Everett, Tennessee, seconded the motion, which was carried, that the nominations be closed.

Nominations for Trustee to Succeed Dr. Ernest E. Irons

Dr. Mather Pfeiffenberger, Illinois, nominated Dr. Edwin S. Hamilton, Kankakee, Ill., to succeed Dr. Ernest E. Irons as Trustee, and the nomination was seconded by several.

Dr. R. K. Packard, Illinois, nominated Dr. Warren W. Furey, Chicago, for that office and that nomination was seconded by several.

On motion of Dr. Robert H. Hayes, Illinois, seconded by Dr. G. Henry Mundt, Illinois, and carried nominations for Trustee to succeed Dr. Ernest E. Irons were closed.

Trustee to Succeed Dr. Wingate Johnson, Winston-Salem, N. C., Who Was Appointed to Serve Until this Session for Dr. C. W. Roberts, Atlanta, Ga., Deceased

Dr. J. Morrison, Hutcheson, Va., nominated Dr. Walter B. Martin, Norfolk, Va., to complete the unexpired term of Dr. C. W. Roberts, deceased and the nomination was severally seconded.

Dr. Charles F. Strosnider, North Carolina, nominated Dr. Wingate Johnson, Winston-Salem, N. C., for that office.

Dr. William Weston, Section on Pediatrics, moved that nominations be closed, and the motion was seconded by several and carried.

Several delegates requested permission to deposit their ballots immediately as they were forced to leave. On motion, duly made, seconded and carried the following named delegates were granted such permission: Dr. Lowell S. Goin, California; Drs. J. Stanley Kenney, Thomas M. Brennan, A. A. Gartner, P. J. Di Nitale and Scott Lord Smith, New York; Dr. Hilton S. Read, New Jersey; Dr. G. S. Klump, Pennsylvania; Drs. F. M. Wiseley, L. Howard Schriver and E. P. McNamee, Ohio, and Dr. E. L. Compere, Section on Orthopedic Surgery.

On motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Dr. Mather Pfeiffenberger, Illinois, and carried, the list was closed.

Place of Annual Session in 1951

Dr. E. L. Henderson, Chairman, Board of Trustees, reported as follows: Atlantic City has been chosen for the 1949 Annual Session and San Francisco for the 1950 Annual Session. Invitations have been received from Atlantic City and Chicago to hold the annual session in 1951 in those cities, and both cities have the facilities for holding a session.

The Speaker announced that this concluded the nominations for the blue ballot.

Nominations for Standing Committees by the President

Nominations for Members of Judicial Council

Dr. R. L. Sensenich, President, nominated as members of the Judicial Council; Dr. John H. O'Shea, Spokane, Wash., to succeed himself, and Dr. Homer L. Pearson Jr., Miami, Fla., to fill the unexpired term of Dr. Lloyd Noland, resigned.

Nomination for Member of Council on Scientific Assembly

Dr. Sensenich nominated Dr. Alphonse McMahon, St. Louis, to succeed Dr. L. B. Jackson, San Antonio, Texas, as a member of the Council on Scientific Assembly.

It was moved by Dr. A. A. Walker, Alabama, seconded by Dr. James C. Sargent, Wisconsin, and carried, that the House confirm the nominations made by the President and the Speaker declared Dr. John H. O'Shea, Dr. Homer L. Pearson Jr., and Dr. Alphonse McMahon duly elected to the offices indicated by the President.

Nominations for Standing Committees by Board of Trustees

Nominations for Council on Medical Education and Hospitals

Dr. E. L. Henderson, Chairman, Board of Trustees, stated that it is customary to submit two names for each vacancy on the Council on Medical Education and Hospitals, and, therefore, the Board nominates to succeed Dr. John H. Musser, deceased, whose place in the interim had been filled by Dr. Virgil P. Sydenstricker, Augusta, Ga., Dr. William L. Pressly, Due West, S. C., and Dr. Carl A. Grote, Huntsville, Ala., in compliance with the amended By-Law passed by the House.

Dr. E. L. Henderson, Chairman, Board of Trustees, nominated, for the member of the Council on Medical Education and Hospitals to succeed Dr. Harvey B. Stone, Baltimore, Dr. Harvey B. Stone, Baltimore, and Dr. L. T. Coggeshall, Chicago.

Nominations for Council on Medical Service

Dr. E. L. Henderson, Chairman, Board of Trustees, presented, as is customary, three names in nomination for each vacancy on the Council on Medical Service. The following were nominated to succeed Dr. Walter B. Martin, Norfolk, Va.: Dr. Henry B. Mulholland, Charlottesville, Va.; Dr. Julian Price, Florence, S. C., Dr. W. R. Brooksher, Fort Smith, Ark.

Dr. Henderson presented the following nominations for member of the Council on Medical Service to succeed Dr. A. W. Adson, Rochester, Minn., Dr. Joseph D. McCarthy, Omaha; Dr. James Stevenson, Tulsa, Okla., and Dr. Thomas F. Thornton, Waterloo, Iowa.

Roll Call for Balloting

The Secretary called the roll and each delegate as his name was called answered the roll and deposited his three ballots in the ballot box, after which the tellers proceeded to count.

Election of Affiliate Fellows

Physicians from Adjacent Country

The Secretary presented the nominations, approved by the Judicial Council, of Dr. John McMillan, Montreal, Canada, and Dr. H. V. Dobson, Peterborough, Ontario, Canada, for Affiliate Fellowship. The nominations were seconded by Dr. Arthur J. Bedell, Section on Ophthalmology and carried.

American Medical Missionaries

The Secretary presented nominations approved by the Judicial Council for Affiliate Fellowship of the following named medical missionaries:

Aldrich, Herschel C., Nadiad, India.
Brewster, Harold N., Foochow, China.
Carlson, *Emery W., Kunming, Yunnan, China.*
Christensen, Aage J., Robertsport, Liberia, West Africa.
Dick, Willis G., Mukden, Manchuria, China.
Fischer, Viola L., Shanghai, China.
Fisher, Kenneth B., Loma Linda, Calif.
Hestenes, Erling G., St. Paul, Minn.
Innocent, George C., Singapore.
Lefforge, E. Everett, Sierra Leone, W. Africa.
Ross, J. Hervey, *Morelia* Michoacan, Mexico.
Schilt, Clarence H., Bagdad, Iraq.
Wagner, William, Portland, Ore.

NOMINATED BY SECTIONS

On motions duly made, seconded and carried, the following nominees for Affiliate Fellowship approved by the Sections indicated were elected:

Section on Laryngology, Otology and Rhinology

Holtman, David Eugene, Boyceville, Wis.
Koenig, Oscar, Glendale, Calif.

Section on Pathology and Physiology

Glaser, Robert J., St. Louis.

Section on Preventive and Industrial Medicine and Public Health

Hein, Fred V., Chicago.

Election of Associate Fellows

On motion of Dr. H. B. Everett, Tennessee, seconded by Dr. B. H. Minchew, Georgia, and carried, the following named physicians, approved by the Council on Scientific Assembly, were elected Associate Fellows:

ALABAMA

Compton, Wheeler W., Black Mountain, N. C.
Hill, Hugh W., Carrollton.

Citation for Distinguished Lay Service

Dr. William Bates, Pennsylvania, moved that in the future the House consider nominations for receiving Citations for Distinguished Lay Service, after they have been received from the Board of Trustees, in Executive Session and act on them in Executive Session. The motion was seconded by several and carried.

Dates of 1949 and 1950 Sessions

Dr. E. L. Henderson, Chairman, Board of Trustees, announced that the 1949 Annual Session would be held in Atlantic City June 6 to 10; the 1950 Annual Session in San Francisco, June 26-30, and the 1949 Interim Session in St. Louis, Nov. 30 to Dec. 3. He added that Dr. David Allman would be the Chairman of the Local Committee on Arrangements for the Atlantic City session in 1949.

Retirement of Dr. Arthur J. Bedell

Dr. Edward P. Flood, New York, announced that Dr. Arthur J. Bedell, Section on Ophthalmology, a member of the House for thirty-three years, is retiring and that he was sure all would miss him.

Expressions of Appreciation

On motion of Dr. F. F. Borzell, Vice Speaker, seconded by Dr. H. B. Everett, Tennessee, and carried, a unanimous vote of thanks was tendered the Chicago Medical Society and the Illinois State Medical Society for their gracious functioning as hosts.

It was moved by Dr. Britton E. Pickett, Texas, seconded by Dr. H. P. Ramsey, District of Columbia, and carried by a rising vote, that the House extend its sincere thanks to Dr. R. W. Fouts for his long and faithful service as Speaker of the House.

Address of Dr. R. W. Fouts

The Vice Speaker presided while Dr. R. W. Fouts addressed the House as follows: Gentlemen, I must admit that it is with somewhat mingled emotion and feeling that I pass this gavel on to a man who I know is eminently qualified, but at the same time having in mind that after all these years I will miss it. If I have served you with satisfaction it has been because of the fine help that I have had and the generous cooperation from each and every delegate. I have done my best. You have seen fit to elect me to the Vice-Presidency, so farewell here does not necessarily mean finality. You will be seeing me. Thank you a lot.

On motion of Dr. B. H. Minchew, Georgia, seconded and carried, the House extended its thanks to the hospitality of

Chicago through the hotels, including the Palmer House, headquarters hotel for the House of Delegates, and the Chicago Hotel Association.

Election of President-Elect

The tellers announced that the total vote on the white ballot was 166. Dr. Ernest E. Irons, Chicago, received 91 votes for President-Elect and Dr. A. W. Adson, Rochester, Minn., received 75, and the Speaker declared Dr. Irons elected President-Elect for the ensuing year, having received a majority of the votes cast.

Election of Vice Speaker of House of Delegates

Of the 166 votes cast, Dr. James R. Reuling Jr., Bayside, N. Y., received 89 and Dr. Creighton Barker, New Haven, Conn., 77. The Speaker declared Dr. Reuling, having received the majority of the votes cast, elected Vice Speaker of the House of Delegates for the ensuing year.

On motion of Dr. Thomas P. Murdock, Connecticut, seconded by Dr. Creighton Barker, Connecticut, and carried, the vote for Dr. Reuling was made unanimous.

Dr. W. A. Coventry, Minnesota, moved that Dr. Ernest E. Irons be declared unanimously elected President-Elect, and the motion was seconded by Dr. J. B. Lukins, Kentucky, and carried, and the Speaker declared Dr. Irons so elected.

Presentation and Address of President-Elect Ernest E. Irons

Dr. Charles H. Phifer, Illinois, introduced the President-Elect, Dr. Ernest E. Irons, who addressed the House as follows:

Mr. Speaker, members of the House: Always, I suppose, to all persons who are so honored, the acknowledgment of an honor becomes a very difficult procedure.

I am impressed with the responsibilities which you have placed on me. Personally, I offer to the House my deepest thanks and gratitude for thus honoring me. I feel no elation. I should, I suppose, but any spark of elation is overcome by a sense of responsibility.

I have been preceded in office, for the last two or three years particularly, by men who have given yeoman service to medicine. We have before us a temporary cessation of the efforts to abridge the freedom of American medicine. We have won some preliminary skirmishes, but, make no mistake, we are not through with this fight. It is a fight that is much more than the fight for the freedom of American medicine. It is a fight for the preservation of American democracy and the American way of life. We have knowledge that there are other attacks in the offing, and I know that the Board of Trustees and your other officers are taking the necessary steps to combat them.

But the battle is going to come a little later, and as the termites that have been boring from within against our democratic way of life become a little more conscious of a losing battle, we shall find that the attacks will become a little more subtle, if that could be, and a little more vigorous.

The opportunity of this House is particularly great now, for you may be able and should be able to arouse in all county medical societies a will to get out and fight locally, and that has not been the case up to date. I say that not in criticism but merely as a statement of fact.

As we all go back to our daily routine, I hope that every one of us may begin, if he has not already begun, an effort to arouse the profession in the county societies and then at the state levels. If we do that, we have 130,000 doctors who can swing anything and bring the public to know the problems that they are facing and the efforts that they must make if they are to maintain their individual freedom and the American way of life.

Again, I thank you for this signal honor which I feel very deeply. I hope I have expressed in some small way my thanks to all of you.

Election of Members of Council on Medical Education and Hospitals

The tellers announced the following results of the vote for members of the Council on Medical Education and Hospitals: *For the member to serve for seven years, Dr. Harvey B. Stone,* Baltimore, received 134 votes and Dr. L. T. Coggeshall, Chicago, 16; for the member to serve for six years, Dr. William L. Pressly, Due West, S. C., received 126 votes and Dr. Carl A. Grote, Huntsville, Ala., 22. The Speaker declared Dr. Stone elected *for a term of seven years and Dr. Pressly for a term* of six years.

Election of Members of Council on Medical Service

The tellers announced the following results of the vote for members of the Council on Medical Service: In place of Dr. Walter B. Martin, Norfolk, Va., Dr. H. B. Mulholland, Charlottesville, Va., received 99 votes, Dr. William R. Brooksher, Fort Smith, Ark., 30, and Dr. Julian Price, Florence, S. C., 16. The Speaker declared Dr. Mulholland, having received the majority of the votes cast, a member of the Council on Medical Service.

The tellers announced the following results of the balloting for a member of the Council on Medical Service in place of Dr. A. W. Adson, Rochester, Minn.: Dr. James Stevenson, Tulsa, Okla., received 47 votes, Dr. Joseph D. McCarthy, Omaha, 62 and Dr. Thomas F. Thornton, Waterloo, Iowa, 32; no one having received a majority of the votes cast, the Speaker announced that another ballot would be taken between Dr. McCarthy and Dr. Stevenson.

Election of Trustees

The tellers announced the results of the voting on the blue ballot:

For Trustee for a term of five years to succeed Dr. William F. Braasch, Rochester, Minn., Dr. Louis A. Buie, Rochester, Minn., 53; Dr. Gunnar Gundersen, La Crosse, Wis., 63, and Dr. James R. McVay, Kansas City, Mo., 48. The Speaker announced that, as no one had received a majority of the votes cast, another vote would have to be taken on Dr. Buie and Dr. Gundersen.

For Trustee for a term of five years to succeed Dr. Ernest E. Irons, Chicago: Dr. Edwin S. Hamilton, Kankakee, Ill., 101, and Dr. Warren W. Furey, Chicago, 63.

The Speaker declared Dr. Hamilton elected Trustee for a term of five years, since he had received a majority of the votes cast.

On motion of Dr. Fred H. Muller, Illinois, seconded and carried, Dr. Edwin S. Hamilton, Kankakee, Ill., was declared unanimously elected Trustee.

For Trustee to serve three years to succeed Dr. C. W. Roberts, deceased: Dr. Walter B. Martin, Norfolk, Va., 110, and Dr. Wingate Johnson, Winston-Salem, N. C., 54. The Speaker declared Dr. Martin elected a Trustee for a term of three years, as he had received a majority of the votes cast.

Place of Annual Session in 1951

The tellers announced that Atlantic City had received 94 votes and Chicago 59. The Speaker declared that the House had selected Atlantic City as the place of the 1951 Annual Session, since it had received a majority of the votes cast.

Election of Trustee and of Member of Council on Medical Service

The tellers spread the second ballot for the two places in which no majority was had. The result of the vote was announced as follows:

For Trustee for a term of five years, Dr. Louis A. Buie, Rochester, Minn., 46, and Dr. Gunnar Gundersen, La Crosse, Wis., 87.

The Speaker declared Dr. Gundersen elected Trustee for a term of five years to succeed Dr. William F. Braasch, Rochester, Minn., since he had received a majority of the votes cast.

For Member of Council on Medical Service, Dr. Joseph D. McCarthy, Omaha, 68, and Dr. James Stevenson, Tulsa, Okla., 61.

The Speaker declared Dr. Joseph D. McCarthy, Omaha, having received the majority of the votes cast, elected a member of the Council on Medical Service for a term of three years.

The House adjourned sine die at 5:40 p. m.

The Scientific Exhibit

The Scientific Exhibit at the Chicago Session of the American Medical Association caused much favorable comment. The artistic quality of the exhibits, the care with which the material was selected and correlated, the patience and perseverance of the demonstrators all resulted in crowded aisles throughout the week. The studious attitude of the physicians present attested to the value of this form of graduate medical instruction.

Three special exhibits were subsidized by the Board of Trustees. The Special Exhibit on Fractures, occupying six booths, was presented for the seventeenth time under the guidance of a committee consisting of Dr. Kellogg Speed, Chicago, chairman; Dr. Frederick A. Jostes, St. Louis, and Dr. Gordon M. Morrison, Boston. The interest in this subject seems to increase with the years. A large number of competent demonstrators took part, and a pamphlet describing the exhibit was distributed.

The Special Exhibit on Physical Medicine was shown for the third time with the usual outstanding success. The committee in charge consisted of Dr. Frank H. Krusen, Rochester, Minn., chairman; Dr. Winfred Overholser, Washington, D. C., and Dr. Howard A. Rusk, New York. There were eight booths, and a pamphlet describing the work in each booth was distributed.

The Special Exhibit on Fresh Pathologic Material, which has been a feature from time to time for many years, was presented by a committee of which Dr. I. Davidsohn, Chicago, was chairman, assisted by a large group of competent pathologists. Fresh pathologic material was brought in each morning and afternoon from various local hospitals, and the continuous demonstrations were a valuable part of the meeting.

Other features of the meeting included a miscellaneous number of subjects. A group of exhibits on diabetes was supplemented by clinics and conferences on diabetes under the guidance of Dr. Howard F. Root, Boston. The program was continuous with a different speaker every half hour, and the room filled to capacity most of the time.

Cancer detection was emphasized by a group of eleven exhibits presented with the cooperation of the American Cancer Society, the American College of Surgeons and the Cancer Prevention Center of Chicago. Dr. Augusta Webster, Chicago, was chairman of the group.

The medical aspects of atomic energy were featured by ten exhibits which attracted an unusual amount of attention. The Atomic Energy Commission, as well as the Army, Navy and Air Force, were represented. Mr. Howard A. Carter, Chicago, assisted in organizing this program.

Motion pictures were shown in two theaters adjoining the exhibits. Thirty-six films were shown once each day throughout the week to enthusiastic audiences. Many of the films supplemented exhibits on the same subjects.

Seventeen sections of the Scientific Assembly presented groups of exhibits dealing with the various branches of medicine. The exhibits were carefully chosen by the Committee on Scientific Exhibit for timeliness and teaching value. Awards were made for the best exhibits by the Committee on Awards.

The Section on Internal Medicine showed fifteen exhibits, three of which received honorable mention. The section representative was Dr. Thomas C. Garrett, Philadelphia.

The Section on Surgery, General and Abdominal, had twenty-six exhibits, one of which was given a certificate of merit and two honorable mention. Dr. Walter G. Maddock, Chicago, was the section representative.

The Section on Obstetrics and Gynecology had nine exhibits, one of which received honorable mention. The section representative was Dr. Frederick H. Falls, Chicago.

The Section on Ophthalmology showed seven exhibits. There were three awards—a gold medal, a bronze medal and a certificate of merit. The section exhibit committee consisted of Dr. Georgiana D. Theobald, Oak Park, Ill., chairman; Dr. Edwin B. Dunphy, Boston and Dr. Phillips Thygeson, San Jose, Calif.

The Section on Laryngology, Otology and Rhinology had seven exhibits, one of which received a certificate of merit. Dr. James B. Costen, St. Louis, was the section representative.

The Section on Pediatrics had eight exhibits. There were two awards—a certificate of merit and an honorable mention. The section representative was Dr. Albert V. Stoesser, Minneapolis.

The Section on Experimental Medicine and Therapeutics had ten exhibits, one of which received a certificate of merit and one honorable mention. Dr. Robert W. Wilkins, Boston, was the section representative.

The Section on Pathology and Physiology presented nine exhibits. There were three awards—a gold medal, a bronze medal and an honorable mention. Dr. Frank W. Konzelmann, Atlantic City, was the section representative.

The Section on Nervous and Mental Diseases had six exhibits. The section representative was Dr. A. B. Baker, Minneapolis.

The Section on Dermatology and Syphilology had twelve exhibits, with two awards of a silver medal and honorable mention. The section representative was Dr. Francis W. Lynch, St. Paul.

The Section on Preventive and Industrial Medicine and Public Health had seventeen exhibits, one of which received a certificate of merit. The section representative was Dr. Paul A. Davis, Akron, Ohio.

The Section on Urology showed eight exhibits. Dr. John H. Morrissey, New York, was the section representative.

The Section on Orthopedic Surgery had ten exhibits. There were two awards—a silver medal and a certificate of merit. Dr. Tom Outland, Elizabethtown, Pa., was the section representative.

The Section on Gastro-Enterology and Proctology had eight exhibits. The section representatives were Drs. Donovan C. Browne, New Orleans, and J. P. Nesselrod, Evanston, Ill.

The Section on Radiology had five exhibits, one of which received an honorable mention. Dr. S. W. Donaldson, Ann Arbor, Mich., was the section representative.

The Section on Anesthesiology had four exhibits, one of which received a certificate of merit. The section representative was Dr. Urban H. Eversole, Boston.

The Section on General Practice of Medicine had eight exhibits, one of which received a certificate of merit. Dr. M. B. Casebolt, Kansas City, Mo., was the section representative.

Twenty-seven papers which were read before the sections of the Scientific Assembly were correlated with exhibits in the Scientific Exhibit.

Report of The Committee on Awards

The Committee on Awards made the following report:

GROUP I

(Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation.)

The GOLD MEDAL to J. Garrott Allen, Margaret Sanderson, Willadene Egner, Charles McKeen, Richard Elghammer, James Crosbie and Burt Grossman, University of Chicago School of Medicine and Argonne National Laboratory, Chicago, for the exhibit on Hemorrhagic Disease Caused by Heparinemia—Temporary Control by Toluidine Blue or Protamine Sulfate.

The SILVER MEDAL to Harry B. Macey, Scott and White Hospital, Temple, Texas, for the exhibit on Plastic Procedure for Lymphedema of the Extremities.

The BRONZE MEDAL to William Stone Jr., Massachusetts Eye and Ear Infirmary, Boston, for the exhibit on New Type Movable Implant.

CERTIFICATES OF MERIT, Group I, are awarded to the following (alphabetically arranged):

William P. Boger and J. Wm. Crosson, Philadelphia General Hospital, Philadelphia, for the exhibit on Caronamide—Application to Enhancement of Penicillin Therapy.

Albert Faulconer Jr., Roger W. Ridley and Richard E. Jones, Mayo Clinic, Rochester, Minn., for the exhibit on An Acoustic Gas Analyzer for Research in Anesthesiology.

Arild E. Hansen and Hilda F. Wiese, University of Texas School of Medicine, Galveston, for the exhibit on Dietary Fat in Relation to the Skin.

Sibley W. Hoobler and Gordon K. Moe, University of Michigan Medical School, Ann Arbor, and Richard H. Lyons, Syracuse University Medical School, Syracuse, N. Y., for the exhibit on Autonomic Blockade with Tetraethylammonium—Pharmacologic Studies with Specific References to Its Diagnostic and Therapeutic Use in Peripheral Vascular Diseases.

David Lehr, New York Medical College, Flower and Fifth Avenue Hospitals, New York, for the exhibit on Low Toxicity of Sulfonamide Combinations—Experimental and Clinical Studies.

In addition, the following exhibits are deemed worthy of Honorable Mention (alphabetically arranged):

That of William Bickers, Richmond, Va., on Dysmenorrhea.

That of Helen Ollendorff Curth, Columbia University College of Physicians and Surgeons, New York, on Cancer and Acanthosis Nigricans.

That of Arthur Lack, Travis Winsor and William Adolph, University of Southern California School of Medicine, Los Angeles, and Birmingham Veterans Administration Hospital, Van Nuys, Calif., on Biomicroscopy of Conjunctival Vessels in Hypertension.

That of Irving S. Wright, Charles D. Marple and Dorothy F. Beck, Committee for the Evaluation of Anticoagulants in the Treatment of Coronary Occlusion with Myocardial Infarction, American Heart Association, New York, on Anticoagulants in the Treatment of Coronary Occlusion with Myocardial Infarction.

That of Anton S. Yuskis and George C. Griffith, University of Southern California School of Medicine and Los Angeles County General Hospital, Los Angeles, on Orthostatic Hypotension and Orthostatic Tachycardia.

GROUP II

(Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts.)

The GOLD MEDAL to Bertha A. Klien, Chicago, for the exhibit on Disease of the Fundus Oculi.

The SILVER MEDAL to *J. Walter Wilson, University of Southern California, and Orda A. Plunkett, University of California at Los Angeles, for the exhibit on Practical Medical Mycology—Culture and Identification of Fungi as an Office Procedure.*

The BRONZE MEDAL to L. W. Kinsell, G. D. Michaels, Sheldon Margen, H. A. Harper, W. E. Larsen, D. P. McCallie and E. F. Evans, University of California Medical School, San Francisco and U. S. Naval Hospital, Oakland, Calif., for the exhibit on Protein Metabolism in Disease of the Liver.

CERTIFICATES OF MERIT, Group II, are awarded the following (alphabetically arranged):

John G. Bellows and Chester J. Farmer, Northwestern University Medical School, Chicago, for the exhibit on Treatment of Ocular Infections—Use of Chemotherapeutic Agents.

J. Brown Farrior, Tampa, Fla., and Richard C. Boyer, Ochsner Clinic, Tulane Medical School, New Orleans, for the exhibit on the Ear in Roentgen Anatomy.

Garrett Pipkin, St. Joseph's Hospital, Kansas City, Mo., for the exhibit on Indefinite Knee Symptoms Resembling Injured Cartilages.

Alfred R. Roos and John C. Roos, College of Medical Evangelists, Los Angeles, for the exhibit on Hay Fever Research in the Pacific Southwestern States—Visual Education in Allergy.

Claire L. Straith, William G. McEvitt, Matthew Pilling and John R. Lewis, Straith Clinic for Plastic Surgery, Detroit, for the exhibit on Automobile Injuries.

In addition, the following exhibits are deemed worthy of *Honorable Mention (alphabetically arranged):*

That of Carleton Dean, Michigan Crippled Children Commission, Lansing, Mich., on Prosthetic Training for Child Amputees in Michigan.

That of Georgia Price and Elizabeth F. Carr, Northwestern University Medical Library, Chicago, on Literature Illustrating the History of Surgery.

That of Michael A. Rubinstein, Montefiore Hospital, New York, on Multiple Myeloma—Its Relation to Leukemia.

That of John D. Stewart, Sidney M. Schaer, W. H. Potter and Alfred J. Massover, University of Buffalo School of Medicine, Buffalo, on Management of Massively Bleeding Gastroduodenal Ulcer.

That of Heinz S. Weens, James V. Warren, David F. James and Herbert M. Olnick, Emory University School of Medicine, Atlanta, Ga., on Contrast Visualization of the Vascular System.

That of Julius S. Weingart, Iowa Lutheran Hospital, Des Moines, Iowa, on Stereoscopic Photography of Pathologic Specimens.

SPECIAL COMMENDATION

Special Commendation is given to the group of exhibits on Atomic Energy for the timeliness and excellence of presentation of this subject.

Special Commendation is given to the group of exhibits on Cancer arranged with the cooperation of the American Cancer Society, the American College of Surgeons and the Cancer Prevention Center of Chicago.

Special Commendation is given to the group of exhibits on diabetes, as well as the Clinical Conference on Diabetes which is presented in conjunction with the exhibits under the chairmanship of Dr. Howard F. Root, Boston.

SUBSIDIZED EXHIBITS

The Committee on Awards commends highly the Special Exhibits on Fractures, Fresh Pathologic Material and Physical Medicine, which are sponsored by the Board of Trustees of the American Medical Association.

COMMENTS

The sincere and hearty cooperation of the representatives of the seventeen sections of the Scientific Assembly is largely responsible for maintaining the Scientific Exhibit as the most important educational feature of the A. M. A. Convention.

The Committee is impressed with the excellence of the motion pictures presented in the theaters adjacent to the Scientific Exhibit.

The Committee on Awards wishes to express its appreciation and that of all physicians to the Director of the Scientific Exhibit, Dr. Thomas G. Hull, and his assistants, for their selfless devotion in making possible these exhibits which represent the best in research and postgraduate medical education.

Respectfully submitted,

FRANK W. HARTMAN, Detroit, Chairman.
WILBUR BAILEY, Los Angeles.
DAVID BOSWORTH, New York.
DERYL HART, Durham, N. C.
JOE VINCENT MEIGS, Boston.

MINUTES OF THE SECTIONS

SECTION ON INTERNAL MEDICINE

Wednesday, June 23—Afternoon

The meeting was called to order at 2 o'clock by the chairman, Dr. Cecil J. Watson of Minneapolis.

Drs. Robert M. Marcussen and Harold G. Wolff, New York, presented a paper on "The Therapy of Migraine Headache." Discussed by Drs. Roland P. Mackay of Chicago and Eugene Foldes, New York.

Drs. Russell L. Haden and Donald W. Bortz, Cleveland, presented a paper on "The Treatment of Pernicious Anemia." Discussed by Drs. Frank H. Bethell, Ann Arbor, Mich.; Howard L. Alt, Chicago; Hyman I. Goldstein, Camden, N. J., and William P. Murphy, Boston.

Dr. Henry M. Thomas Jr., Baltimore, read a paper on "What Is Psychotherapy?" Discussed by Dr. Francis J. Gerty, Chicago.

Dr. Robert H. Williams, Boston, read a paper on "Selection of Therapy for Individual Patients with Thyrotoxicosis." Discussed by Drs. Saul Hertz, Boston, and Willard O. Thompson, Chicago.

Dr. James S. McLester, Birmingham, Ala., read the Frank Billings Lecture on "Protein Comes into Its Own."

Dr. Elliott P. Joslin of Boston read a paper on "The Furtherance of Diabetes Therapy." Discussed by Drs. W. Wallace Dyer, Philadelphia; Henry T. Ricketts, Chicago, and Frederick M. Allen, New York.

Thursday, June 24—Afternoon

The following officers were elected: Marion A. Blankenhorn, Cincinnati, chairman; Priscilla White, Boston, vice chairman; Charles T. Stone, Dallas, Texas, delegate; William D. Stroud, Philadelphia, alternate delegate; Thomas C. Garrett, Philadelphia, representative to the Scientific Exhibit.

Drs. F. Tremaine Billings Jr., Bernard M. Kalstone, James L. Spencer and George R. Meneely, Nashville, Tenn., presented a paper on "Prognosis of Acute Myocardial Infarction." Discussed by Drs. Herrman L. Blumgart, Boston, and Chauncey C. Maher, Chicago.

Drs. Louis Leiter, Reuben Mokotoff, Raymond Weston, Doris J. W. Escher, Leon Hellmann and Martin Cherkasky, New York, presented a paper on "The Mechanism and Treatment of Renal Dysfunction in Chronic Congestive Heart Failure." Discussed by Drs. Arthur M. Master, New York; Tinsley R. Harrison, Dallas, Texas, and Fred M. Allen, New York.

Dr. Cecil J. Watson, Minneapolis, read the chairman's address, on "Certain Activities and Impacts of the American Board of Internal Medicine."

Dr. Edward S. Ray, Richmond, Va., read a paper on "Sarcoidosis." Discussed by Drs. George T. Harrell, Winston-Salem, N. C., and Robert G. Bloch, Chicago.

Drs. John R. McDonald and Lewis B. Woolner, Rochester, Minn., presented a paper on "The Value of Cytologic Study of Sputum and Bronchial Secretions in the Diagnosis of Carcinoma of the Lung." Discussed by Dr. Henry A. Cromwell, New York.

Drs. Ralph Tompsett, Alphonse Timpanelli and Walsh McDermott, New York, presented a paper on "Discontinuous Therapy with Penicillin." Discussed by Drs. W. W. G. Maclachlan, Pittsburgh, and Frederick H. King, New York.

Friday, June 25—Morning

A joint meeting was held with the Section on Experimental Medicine and Therapeutics. The minutes of this meeting appear in the minutes of the Section on Experimental Medicine and Therapeutics.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

Wednesday, June 23—Morning

The meeting was called to order at 9 o'clock by the chairman, Dr. B. Noland Carter, Cincinnati.

Dr. Arthur B. McGraw, Detroit, read a paper on "Factors Contributing to Low Mortality in Appendectomy for Acute Appendicitis: A Ten-Year Study." Discussed by Drs. Frederick F. Boyce, New Orleans; Max M. Zinninger, Cincinnati; J. L. Crook, Jackson, Tenn., and Arthur B. McGraw, Detroit.

Dr. William A. Altemeier, Cincinnati, read a paper on "The Treatment of Acute Septic Peritonitis." Discussed by Drs. Champ Lyons, New Orleans; Edwin J. Pulaski, San Antonio, Texas, and W. A. Altemeier, Cincinnati.

Drs. Robert W. Buxton and Frederick A. Coller, Ann Arbor, Mich., presented a paper on "Acute Obstruction of the Small Bowel." Discussed by Drs. R. J. Noer, Detroit; Clarence Dennis, Minneapolis, and Dr. Frederick A. Coller, Ann Arbor, Mich.

Dr. Marshall L. Michel, New Orleans, read a paper on "Acute Obstruction of the Colon." Discussed by Drs. Clarence Dennis, Minneapolis; George V. Brindley, Temple, Texas, and M. L. Michel, New Orleans.

Dr. Louis M. Rousselot, New York, read a paper on "The Rationale and Value of Combined (One Stage) Splenectomy and Portocaval Shunts in Portal Hypertension: Observations on Venous Shunts in the Postsplenectomy Patient with Recurring Hemorrhage." Discussed by Drs. Robert R. Linton, Brookline, Mass.; Paul Ravenna, Chicago, and L. M. Rousselot, New York.

Dr. Brian B. Blades, Washington, D. C., read a paper on "Empyema." Discussed by Drs. Edward M. Kent, Pittsburgh, and Thomas H. Burford, St. Louis.

Thursday, June 24—Morning

The following officers were elected: chairman, Dr. William MacFee, New York; vice chairman, Dr. Emil Holman, San Francisco.

Dr. B. Noland Carter, Cincinnati, read the chairman's address on "The Present Status of Surgery of the Heart and Associated Great Vessels."

Dr. George Crile Jr., Cleveland, read a paper on "The Incidence of Malignant Tumors of the Thyroid." Discussed by Drs. Charles W. Mayo, Rochester, Minn.; Warren H. Cole, Chicago, and George Crile Jr., Cleveland.

Drs. I. S. Ravdin and Edward Rose, Philadelphia, presented a paper on "Hyperthyroidism." Discussed by Drs. Harold L. Foss, Danville, Pa.; Warren H. Cole, Chicago, and I. S. Ravdin, Philadelphia.

Dr. Winchell McK. Craig, Rochester, Minn., read a paper on "Hypertension: Evaluation of Treatment." Discussed by Drs. Geza de Takats, Chicago; James L. Poppen, Boston; Frederick M. Allen, New York, and W. McK. Craig, Rochester, Minn.

Dr. Norman E. Freeman, San Francisco, read a paper on "Acute Arterial Injuries." Discussed by Drs. Frederick W. Cooper, Georgia; Harris B. Shumacker, Baltimore; Geza de Takats, Chicago, and N. E. Freeman, San Francisco.

Dr. Robert E. Gross, Boston, read a paper on "Surgical Treatment for Coarctation of the Aorta." Discussed by Drs. Willis J. Potts, Chicago; Richard B. Capps, Chicago; Alfred Blalock, Baltimore; Egbert H. Fell, Chicago; Norman Freeman, San Francisco, and Robert E. Gross, Boston.

Friday, June 25—Morning

A joint meeting was held with the Section on Gastro-Enterology and Proctology.

Dr. A. H. Aaron, Buffalo, read a paper on "Newer Aspects of the Treatment of Ulcer."

Drs. Keith S. Crimson, R. W. Rundles, George J. Baylin and H. M. Taylor, Durham, N. C., presented a paper on "Vagotomy."

These papers were discussed by Drs. Lester R. Dragstedt, Chicago; Francis D. Moore, Boston; A. C. Ivy, Chicago; Waltman Walters, Rochester, Minn.; Walter L. Palmer, Chicago; Sara M. Jordan, Boston; R. L. Sanders, Memphis, Tenn.; Otto Porges, Chicago; R. S. Dinsmore, Cleveland; Erwin Levin, Chicago; Keith S. Grimson, Durham, N. C., and A. H. Aaron, Buffalo.

Dr. Russell S. Boles, Philadelphia, read a paper on "Nonspecific Inflammatory Lesions of the Terminal Ileum and Colon."

Dr. Leland S. McKittrick, Boston, read a paper on "Nonspecific Inflammatory Lesions of the Small and Large Bowel."

These papers were discussed by Drs. Clarence Dennis, Minneapolis; Burrill B. Crohn, New York; Lester R. Dragstedt, Chicago; Everett D. Kiefer, Boston; J. H. Fitzgibbon, Portland, Ore.; A. F. R. Andresen, Brooklyn; Russell S. Boles, Philadelphia, and Leland S. McKittrick, Boston.

Dr. Neil W. Swinton, Boston, read a paper on "Diagnosis of Carcinoma of the Colon and Rectum." Discussed by Drs. Harry M. Weber, Rochester, Minn.; William H. Daniel, Los Angeles, and Neil W. Swinton, Boston.

SECTION ON OBSTETRICS AND GYNECOLOGY

Wednesday, June 23—Afternoon

The meeting was called to order at 2 o'clock by the chairman, Dr. William F. Mengert, Dallas, Texas.

Dr. Gerald W. Gustafson, Indianapolis, read a paper on "The Management of Occiput Posterior Position." Discussed by Drs. Edward L. Cornell, Chicago; Gerald Rogers, Oklahoma City, and Buford G. Hamilton, Kansas City, Mo.

Drs. Catherine Macfarlane, Margaret C. Sturgis and Faith S. Fetterman, Philadelphia, presented a paper on "Report of a Ten Year Experiment in the Control of Cancer of the Uterus." Discussed by Drs. B. Z. Cashman, Pittsburgh; Augusta Webster, Chicago; J. Hofbauer, Cincinnati, and Catherine Macfarlane, Philadelphia.

Dr. Goodrich C. Schauffler, Portland, Ore., read a paper on "Unusual Experiences in the Practice of Obstetrics and Gynecology in China." Discussed by Drs. Frank E. Whitacre, Memphis, Tenn.; Nicholson J. Eastman, Baltimore; Bertha Selmon, Battle Creek, Mich., and Goodrich C. Schauffler, Portland, Ore.

The following papers were read in a panel discussion on "Endometriosis," Dr. Joe V. Meigs, Boston, moderator.

Dr. Francis B. Carter, Durham, N. C.: "Diagnosis and Medical Management."

Dr. Clayton T. Beacham, Philadelphia: "Conservative Surgical Treatment in Young Women."

Dr. Clyde L. Randall, Buffalo, N. Y.: "Management of Complications of Endometriosis."

Thursday, June 24—Afternoon

The following officers were elected: chairman, Dr. LeRoy A. Calkins, Kansas City, Kan.; vice chairman, Dr. Herbert E. Schmitz, Chicago; secretary, Dr. Arthur B. Hunt, Rochester, Minn.; representative of Board of Governors of the American College of Surgeons, Dr. E. L. King, New Orleans; representatives to American Board of Obstetrics and Gynecology, Dr. Francis B. Carter, Durham, N. C.; Dr. R. A. Kimbrough, Philadelphia, and Dr. Robert A. Faulkner, Cleveland; representatives to American Committee on Maternal Welfare, Drs. Benbow Thompson, Los Angeles, R. D. Mussey Sr., Rochester, Minn., and Oren Moore, Charlotte, N. C.; representative of the Section to the Scientific Exhibit Committee, Dr. F. H. Falls, Chicago.

Dr. William F. Mengert, Dallas, read the chairman's address, entitled "Estimation of Pelvic Capacity."

Dr. Albert Decker, New York, read a paper on "Culdoscopy." Discussed by Drs. Richard W. TeLinde, Baltimore; Woodward Beacham, New Orleans; Irving Stein, Chicago, and Albert Decker, New York.

Dr. Wilson Footer, Oakland, Calif., read a paper on "Pseudomalignant Changes in the Cervix During Pregnancy." Discussed by Drs. Karl H. Martzloff, Portland, Ore.; W. J. Dieckmann, Chicago; Robert L. Faulkner, Cleveland; J. Hofbauer, Cincinnati; Charles Galloway, Evanston, Ill.; Emil Novak, Baltimore, and Wilson Footer, Oakland, Calif.

The following papers were presented in a panel discussion, Dr. C. A. Gordon, Brooklyn, moderator.

Dr. Bernard J. Hanley, Los Angeles, read a paper on "Antepartum and Intrapartum Obstetric Hemorrhage."

Dr. Russell J. Moe, Duluth, Minn., read a paper on "Postpartum Hemorrhage."

Dr. Joseph M. Hill, Dallas, Texas, read a paper on "Precautions to be Taken on Blood Transfusion."

Dr. Frederick W. Hoffbauer, Minneapolis, read a paper on "Precautions in the Use of Plasma in Obstetric Hemorrhage, with Special Reference to the Causation on Hepatitis."

Friday, June 25—Morning

A joint meeting was held with the Section on Pediatrics. The minutes of this meeting appear in the minutes of the Section on Pediatrics.

SECTION ON OPHTHALMOLOGY

Wednesday, June 23—Morning

The meeting was called to order at 9:15 o'clock by the chairman, Dr. Everett L. Goar, Houston, Texas.

On motion of Dr. Arthur J. Bedell, Albany, N. Y., it was voted unanimously to nominate Dr. John A. MacMillan of Montreal, Canada, as an Affiliate Fellow of the American Medical Association, in view of his membership in a chartered national medical society of a foreign country adjacent to the United States, as set forth in the Constitution and By-Laws of the Association.

The Secretary was instructed to prepare immediately a letter setting forth to the Judicial Council of the House of Delegates Dr. MacMillan's qualifications for such an honor, including his excellent training and reputation.

Dr. Everett L. Goar, Houston, Texas, read the chairman's address, entitled "Postgraduate Education in Ophthalmology in the United States."

Dr. John A. MacMillan, Montreal, Canada, read a paper on "Affections of the Lacrimal Gland and Ocular Complications."

Dr. Algernon B. Reese, New York, read a paper on "Retrolental Fibroplasia and Persistent Hyperplastic Primary Vitreous: Two Entities." Discussed by Drs. Brittain F. Payne, New York; Bertha A. Klien, Chicago; Harold Falls, Ann Arbor, Mich., and William C. Owens, Baltimore.

Dr. Theodore H. Ingalls, Southborough, Mass., read a paper on "The Epidemiology of Encephalo-Ophthalmic Dysplasia." Discussed by Drs. William C. Owens, Baltimore, and Everett Kinsey, Boston.

Drs. Adolph Posner and Abraham Schlossman, New York, presented a paper on "Treatment of Glaucoma Associated with Iridocyclitis." Discussed by Drs. Paul A. Chandler, Boston; Albert D. Ruedemann, Detroit; Harvey Thorpe, Pittsburgh; Conrad Berens, New York, and Everett L. Goar, Houston, Texas.

Dr. William B. Clark, New Orleans, read a paper on "The Use of Strips of Orbicularis Oculi Muscles in Surgery of the Eyelids." Discussed by Drs. Norman L. Cutler, Wilmington, Del., and Rex C. House, Fort Sam Houston, Texas.

Thursday, June 24—Morning

Dr. Thomas D. Allen, Chicago, read the report of the Joint Committee on Optics and Visual Physiology. On motion regularly moved and seconded, it was voted unanimously to send a copy of that part of the report pertaining to contact lenses to Colonel Don Longfellow of the Surgeon General's Office, since that office is presently engaged in an investigation of contact lenses.

Chairman Goar read the report of the Committee on the American Board of Ophthalmology.

Dr. Trygve Gundersen, Boston, secretary, read a résumé of the report of the Joint Committee on the National Museum of Ophthalmic Pathology.

Chairman Goar read the report of the Committee on Scientific Exhibit.

Dr. Gundersen read the report of the Committee on the Museum of Ophthalmic History.

Dr. Lawrence T. Post, St. Louis, read the report of the Committee on the American Orthoptic Council.

Chairman Goar read the report of the Advisory Committee to the Eye Health Committee of the Student Health Association.

Dr. M. Hayward Post, St. Louis, read the report of the representative of the Section to the College of Surgeons.

Dr. Frederick A. Davis, Madison, Wis., read the report of the Committee on Awarding the Knapp Medal.

Dr. A. D. Ruedemann, Detroit, read the report of the representative from the Section to the Joint Committee of Industrial Ophthalmology.

Dr. Francis Heed Adler, Philadelphia, read the report of the Committee on the Knapp Testimonial Fund.

Dr. Gundersen read the report on the Howe Fund.

Dr. Conrad Berens, New York, presented the report of the Joint Committee to the National Conference on Medical Nomenclature. He explained the proposal to place in the index of the Standard Nomenclature the numbers of the international classification. The synonyms are not to be used in the body of the volume, but will be placed in the index.

Dr. Arthur J. Bedell, Albany, N. Y., read the report of the delegate of the Section to the House of Delegates of the American Medical Association.

On motion regularly made and seconded, it was voted unanimously that Dr. Bedell's resignation as representative of the Section to the House of Delegates be accepted with regret. The members of the Section extended Dr. Bedell a rising vote of thanks for his thirty-three years of faithful service.

Dr. Derrick Vail, Chicago, read the report of the executive committee.

Dr. Francis Heed Adler, Philadelphia, vice-chairman, presented the Ophthalmic Research Medal of the Section on Ophthalmology to Dr. Alan Churchill Woods, Baltimore. The members of the Section extended an ovation to Dr. Woods.

The following officers were elected: chairman, Dr. M. Hayward Post, St. Louis; vice chairman, Dr. Brittain F. Payne, New York; secretary, Dr. Trygve Gundersen, Boston; delegate, Dr. William L. Benedict, Rochester, Minn.; alternate delegate, Dr. Parker Heath, Detroit; members of Committee for the Award of the Knapp Prize: Dr. Arnold Knapp, New York, chairman; Dr. Phillips Thygeson, San Jose, Calif., and Dr. David Cogan, Boston; Joint American Committee on Optics and Visual Physiology: Dr. Thomas D. Allen, Chicago, chairman; Dr. Walter B. Lancaster, Boston, and Dr. Lawrence T. Post, St. Louis; Committee on American Board of Ophthalmology: Dr. John Dunnington, New York; Dr. C. S. O'Brien, Iowa City, Iowa; Dr. Phillips Thygeson, San Jose, Calif., and Dr. Brittain F. Payne, New York; Joint Committee on National Museum of Ophthalmic Pathology: Dr. Jonas Friedenwald, Baltimore; Committee on Scientific Exhibit from Eye Section: Dr. Georgiana Theobald, Oak Park, Ill., chairman; Dr. Phillips Thygeson, San Jose, Calif., and Dr. Edwin B. Dunphy, Boston; Committee on Museum of Ophthalmic History: Dr. Burton Chance, Philadelphia, chairman; Dr. Hans Barkan, San Francisco, and Dr. E. V. L. Brown, Chicago; Committee on American Orthoptic Council: Dr. Lawrence T. Post, St. Louis; Dr. Truman Boyes, New York, and Dr. Richard Scobee, Fort Worth, Texas. Advisory Committee to the Eye Health Committee of the Student Health Association: Dr. W. L. Benedict, Rochester, Minn.; representatives of Section to College of Surgeons, Board of Governors: Dr. M. Hayward Post, St. Louis; Dr. James N. Greear, Washington, D. C., and Dr. A. Ray Irvine, Los Angeles; representatives from the Section to the Joint Committee of Industrial Ophthalmology: Dr. A. D. Ruedemann, Detroit, chairman; Dr. Hedwig Kuhn, Hammond, Ind., and Dr. Glenn Harrison, Mason City, Iowa; Committee on Public Relations: Dr. Derrick Vail, Chicago; Dr. Parker Heath, Detroit; Dr. Walter B. Lancaster, Boston; Dr. A. Ray Irvine, Los Angeles; Dr. Frederick A. Davis, Madison, Wis.; Dr. Frederick C. Cordes, San Francisco; Dr. Brittain F. Payne, New York; Dr. S. Judd Beach, Portland, Maine; Dr. Alan C. Woods, Baltimore, and Dr. Lawrence T. Post, St. Louis; Joint Committee to National Conference on Medical Nomenclature: Dr. Conrad Berens, New York.

Dr. Arthur J. Bedell, Albany, N. Y., representative of the Section to the House of Delegates, explained that he had taken the necessary steps to expedite the election to Affiliate Fellowship of Dr. John A. MacMillan of Montreal, Canada, and had been assured by the Judicial Council that speedy favorable action would be taken. Dr. Bedell read the list of Dr. MacMillan's qualifications for this Fellowship.

Dr. S. Judd Beach, Portland, Maine, read a paper on "Verified Refraction." Discussed by Drs. M. Hayward Post Jr., St. Louis; Hugo L. Bair, Rochester, Minn.; Joseph I. Pascal, New York, and I. S. Tassman, Philadelphia.

Dr. Arnold W. Forrest, New York, read a paper on "Intraorbital Tumors." Discussed by Drs. Georgiana D. Theobald, Oak Park, Ill.; T. E. Sanders, St. Louis, and Alan C. Woods, Baltimore.

Drs. P. Robb McDonald and Irving H. Leopold, Philadelphia, presented a paper on "The Use of 'D.F.P.' (Diisopropyl Fluorophosphate) in Glaucoma: Evaluation of Results over a Three Year Period." Discussed by Drs. Leo L. Mayer, St. Louis; William F. Hughes Jr., Chicago; Ralph Rychner, Memphis, Tenn.; Adolph Posner, New York, and Everett L. Goar, Houston, Texas.

Dr. Kenneth C. Swan, Portland, Ore., read a paper on "The Blind Spot Syndrome." Discussed by Drs. Francis Heed Adler, Philadelphia, and Hermann M. Burian, Boston.

Dr. Adolph Posner, New York, demonstrated a tonometer which he has developed in his work.

Friday, June 25—Morning

Dr. Ralph S. McLaughlin, Charleston, W. Va., read a paper on "Nonmedical Problems in Industrial Ophthalmology." Discussed by Drs. Hedwig S. Kuhn, Hammond, Ind.; William A. Sawyer, Rochester, N. Y., and Leo L. Mayer, St. Louis.

Dr. Alan C. Woods, Baltimore, read a paper on "The Use of Streptomycin and Streptomycin Plus 'Promizole' in Experimental Ocular Tuberculosis." Discussed by Drs. Phillips Thygeson, San Jose, Calif., and John G. Bellows, Chicago.

Chairman Goar announced that the House of Delegates had confirmed the nomination of Dr. John A. MacMillan, Montreal, Canada, as an Affiliate Fellow of the American Medical Association, and that four members of the Section were awarded honors for exhibits: Dr. Bertha A. Klien, Chicago, was awarded the Gold Medal for her exhibit on "Diseases of the Fundus Oculi"; Drs. John G. Bellows and Chester J. Farmer, Chicago, received a Certificate of Merit for their exhibit on "Treatment of Ocular Infections: Use of Chemotherapeutic Agents"; Dr. William Stone Jr., Boston, received the Bronze Medal for his exhibit on "A New-Type Movable Implant."

Dr. Harold Gifford Jr., Omaha, Neb., read a paper entitled "A Method of Retrobulbar Anesthesia Which Produces an Associated Motor Block of the Extraocular Muscles." Discussed by Drs. Garrett L. Sullivan, Boston; Edward Burch, St. Paul; Purman Dorman, Seattle, and Everett L. Goar, Houston, Texas.

Dr. Watson Gailey, Bloomington, Ill., read a paper on "Basic Principles of Ocular Muscle Surgery." Discussed by Drs. Frank D. Carroll, New York; Beulah Cushman, Chicago; Purman Dorman, Seattle, and A. D. Prangen, Rochester, Minn.

Dr. Gundersen read a further report of the Committee to Study the Effects of Silver Nitrate in Biological Preparations in the Prevention of Ophthalmic Neonatorum. On motion regularly made and seconded, it was voted unanimously to approve the report, approve the recommendation and send copies to the National Society for the Prevention of Blindness, the editor of the *Woman's Home Companion,* the editor of The Journal of the American Medical Association, and to the forty-eight state health departments.

SECTION ON LARYNGOLOGY, OTOLOGY AND RHINOLOGY

Wednesday, June 23—Afternoon

The meeting was called to order at 2:05 o'clock by the chairman, Dr. Fletcher D. Woodward, Charlottesville, Va.

Dr. David Davis, Washington, D. C., read a paper on "Inhalation of Nebulized Aerosols in Office Practice." Discussed by Drs. Alvan L. Barach, New York, and Samuel J. Segal, Boston

Dr. Watt W. Eagle, Durham, N. C., read a paper on "The Symptomatic Elongated Styloid Process." Discussed by Drs. C. M. Kos, Iowa City, Iowa; O. E. Van Alyea, Chicago; Murdock Equen, Atlanta, Ga., and L. A. Nelson, Dallas, Texas.

Dr. De Graaf Woodman, New York, read a paper on "Rehabilitation of the Larynx in Cases of Bilateral Abductor Paralysis: A Report of the Past Four Years' Experience with the Open Approach to Arytenoidectomy for Relief of Bilateral Abductor Paralysis." Discussed by Drs. Paul H. Holinger, Chicago; Fletcher D. Woodward, Charlottesville, Va., and David R. Higbee, San Francisco.

Dr. Russell A. Sage, Indianapolis, read a paper on "Differential Diagnosis of Oral Lesions." Discussed by Drs. Le Roy

A. Schall, Boston; Charles D. Blassingame, Memphis, Tenn., and Joseph Atkins, Philadelphia.

Dr. O. Popper, Johannesburg, South Africa, read a paper on "*Transtympanic Fenestration: The Final Technic.*" *Discussed* by Drs. Douglas Carruthers, Sydney, Australia; A. L. Juers, Chicago, and Scott Stevenson, London, England.

THURSDAY, JUNE 24—AFTERNOON

On motion regularly made and seconded it was voted unanimously to discharge the Committee on Lye Legislation with the thanks of the Section for the splendid work it has done in the past.

In his report as representative to the American Board of Otolaryngology, Dr. LeRoy A. Schall, Boston, announced that in the examinations conducted in the spring, out of a total of 77 applicants approved by the Credentials Committee, 52 passed and 25 failed, with a percentage of failures of 32.4 per cent. In the October examination, out of a total of 71 qualified applicants examined, 47 passed and 24 failed, with a percentage of failures of 33.8 per cent. Approximately 3,000 persons are now certified by the American Board of Otolaryngology.

The following officers were elected: chairman, Dr. Henry B. Orton, Newark, N. J.; vice chairman, Dr. Daniel S. Cunning, New York; secretary, Dr. J. Milton Robb, Detroit; delegate, Dr. Gordon F. Harkness, Davenport, Iowa; alternate, Dr. Carl H. McCaskey, Indianapolis; representative of Section to Scientific Exhibit, Dr. James B. Costen, St. Louis; representative to American College of Surgeons, Dr. Louis H. Clerf, Philadelphia.

Dr. Fletcher D. Woodward, Charlottesville, Va., gave the chairman's address, entitled "A Medical Criticism of Automotive Engineering."

On motion regularly made and seconded, it was voted unanimously to nominate for Affiliate Fellowship the names of David E. Holtman, D.D.S., Boyceville, Wis., and Oscar Koenig, D.D.S., Glendale, Calif.

Dr. John R. Simpson, Pittsburgh, read a paper on "The Management of Acute Laryngotracheobronchitis." Discussed by Drs. Louis H. Clerf, Philadelphia; Paul H. Holinger, Chicago; Gabriel Tucker, Philadelphia; Thomas Galloway, Evanston, Ill., and David Davis, Washington, D. C.

Dr. John B. Erich, Rochester, Minn., read a paper on "Laryngectomy: A Surgical Technic Which Promotes Rapid Healing." Discussed by Drs. LeRoy A. Schall, Boston; Louis H. Clerf, Philadelphia; C. L. Jackson, Philadelphia, and Joseph P. Atkins, Philadelphia.

Dr. J. Brown Farrior, Tampa, Fla., read a paper on "Lymphoid Eustachian Salpingitis (Lymphoid Tubo-Tympanitis): Selective Criteria for Radiation Therapy." Discussed by Drs. Gilbert E. Fisher, Birmingham, Ala.; John R. Lindsay, Chicago, and Stacy R. Guild, Baltimore.

FRIDAY, JUNE 25—AFTERNOON

Dr. Howard P. House, Los Angeles, read a paper on "Surgery of the Chronic Ear by the Endaural Approach." Discussed by Drs. John F. Tolan, Seattle; James E. Croushore, Detroit, and O. Popper, Johannesburg, South Africa.

Dr. Stacy R. Guild, Baltimore, read a paper on "The Interpretation of Hearing Tests." Discussed by Dr. L. R. Boies, Minneapolis.

Dr. Burt R. Shurly, Detroit, delegate, in making his report, announced his resignation after twenty-five years of service. He stated that a resolution had been adopted warning the profession against the trend of interns and medical students toward establishing a left wing organization with definite communistic tendencies. He also announced the formation of a Section on Diseases of the Chest.

The members of the Section extended an ovation to Dr. Shurly in recognition of his long years of faithful service.

Chairman Woodward introduced Dr. Gordon Harkness, Davenport, Iowa, the newly elected delegate.

Drs. George S. McReynolds, Fred R. Guilford and G. R. Chase, Galveston, Texas, presented a paper on "Blast Injuries to the Ear (Texas City Disaster)." Discussed by Drs. John S. Knight, Kansas City, Mo.; Paul A. Campbell, Chicago, and Stanton A. Friedberg, Chicago.

Dr. David R. Higbee, San Diego, Calif., read a paper on "The Sphenopalatine Ganglion: Anatomy, Function and Symptomatology." Discussed by Drs. William E. Grove, Milwaukee, and *W. Likely Simpson, Memphis, Tenn.*

Drs. Chevalier L. Jackson, John V. Blady, Charles Norris and Walter Maloney, Philadelphia, presented a paper on "Cancer of the Larynx: Five-Year End Results in Series of Five Hundred Cases, with Special Study of Those Developing Recurrence or Metastasis." Discussed by Drs. Gordon B. New, Rochester, Minn.; Paul Holinger, Chicago; Gabriel Tucker, Philadelphia; Murdock Equen, Atlanta, Ga., and John Blady, Philadelphia.

SECTION ON PEDIATRICS

WEDNESDAY, JUNE 23—MORNING

The meeting was called to order at 9 o'clock by Dr. Julius Hess, Chicago, acting chairman.

The meeting was opened with a one minute memorial tribute to the late chairman, Dr. Oscar Reiss, Los Angeles.

Drs. R. J. Huebner, W. L. Jellison and M. Dorothy Beck, Hondo, Calif., presented a paper on "American Q Fever." Discussed by Drs. Garnett Cheney of San Francisco and Thomas B. Turner of Baltimore.

Dr. Russell J. Blattner, Houston, Texas, presented a paper on "*Isolation and Identification of Virus from Body Fluids of Human Subjects.*" Discussed by Drs. Herbert A. Wenner, Kansas City, Mo., and James P. Leake, Washington, D. C.

Dr. John M. Adams, Minneapolis, read a paper on "Primary Pneumonitis in Infancy: Clinical, Epidemiologic and Pathologic Observations." Discussed by Dr. C. B. Conklin, Washington, D. C.

Drs. Albert E. Casey, Birmingham, Ala., and William I. Fishbein, Francis B. Gordon, Frank M. Schabel Jr. and Herman N. Bundesen, Chicago, presented a paper on "Clinical Manifestations of Infection with Poliomyelitis Virus." Discussed by Drs. Hulda E. Thelander, San Francisco; James P. Leake, Washington, D. C.; Clarence Webb, Shreveport, La.; Haddon M. Keith, Rochester, Minn., and A. F. Abt, Chicago.

Dr. Edward Scott O'Keefe, Lynn, Mass., read a paper on "*Enteral Treatment of Diarrhea in Infancy.*" *Discussed by* Drs. Arthur W. Chung, New York, and Noel G. Shaw, Evanston, Ill.

Dr. John A. Toomey, Cleveland, read a paper on "Reaction to Whooping Cough Vaccination." Discussed by Drs. Archibald L. Hoyne and Louis M. Sauer, Chicago.

THURSDAY, JUNE 24—MORNING

The following officers were elected: chairman, Dr. Woodruff L. Crawford, Rockford, Ill.; vice chairman, Dr. Ambrose McGee, Richmond, Va.; secretary, Dr. Margaret Mary Nicholson, Washington, D. C.; delegate, Dr. William Weston, Columbia, S. C.

Dr. F. P. Greenbaum presented a resolution as follows:

> This is in memorial of Dr. Oscar Reiss, chairman of the Section on Pediatrics, of the American Medical Association, born March 4, 1883, died June 16, 1948. The announcement of the sudden death of Oscar Reiss, as he was preparing to come to Chicago to preside over the sessions of the Section on Pediatrics of the American Medical Association, deeply touched those members attending the opening meeting on Wednesday, June 23.
>
> Besides being chairman of the Section on Pediatrics—an office given only to those who evidence real leadership—Oscar, as he was affectionately called by hundreds of us, was held in the highest esteem and respect by all who were privileged to know him personally or through his many worth while contributions to pediatric literature.
>
> We all know how he appreciated the chairmanship of this Section and how happy he was to serve in that capacity. The splendid program of this meeting is an evidence of the attention which he gave to all the duties of the office.
>
> Dr. Reiss graduated from the Medical School of the University of Illinois in 1906. He had his pediatric training at the Sarah Morris Hospital, the Children's Department of Michael Reese Hospital, under Drs. Abt and Hess.
>
> After a few years of practice in Chicago, he moved to Los Angeles. *In that city he rose to a position of preeminence in his specialty in a* large field. We list a few of his many activities: Chief of the Pediatric Service of the Los Angeles Children's Hospital; Associate Clinical Professor of Pediatrics of the University of California; Director of the Pediatric Service of the Cedars of Lebanon Hospital; member of the Medical Milk Commission; Chairman of the Los Angeles Mental Hygiene

Society, and member of the important National Advisory Committee of the Children's Bureau. He was specialist certified by the American Board of Pediatrics since 1931, and a fellow of the American Academy of Pediatrics.

With all of these duties, he still found time to train and guide young pediatricians, all of whom loved and revered him. Many of them visited him in California and always found him to be a genial and charming host; a family man, happiest in his home, and a respected member of the community.

His life of service may well be of inspiration to us always. He will be missed and his memory will be cherished.

We, the assembled members of the Section on Pediatrics, meeting in Chicago, June 24, 1948, hereby desire to record permanently on the minutes of this Section the sense of deep loss in the death of our leader and colleague, Oscar Reiss.

Resolved, That a copy of this memorial be sent to his bereaved wife and children with our sympathy.

The resolution was unanimously adopted.

Dr. L. W. Sauer, Evanston, Ill., presented the following motion: "I hereby make a motion that the chairman of the Section on Pediatrics appoint a committee to study the subject of convulsions and encephalopathy after the administration of any type of antigen—a report to be submitted to the Section at some future meeting." The motion was unanimously adopted.

Dr. M. G. Peterman, Milwaukee, read a paper on "Epilepsy in Childhood." Discussed by Drs. Ambrose W. McGee, Richmond, Va., and Frederick A. Gibbs, Chicago.

Drs. James G. Hughes, Robert G Jordan and Fontaine S. Hill, Memphis, Tenn., presented a paper "Jet Injection in Pediatric Practice." Discussed by Drs. Robert A. Hingson, Memphis, Tenn., and Frank H. J. Figge, Baltimore.

Dr. Darell Boyd Harmon, Austin, Texas, presented an address on "The Classroom as a Factor in Growth Deviation." Discussed by Drs. George F. Munns, Winnetka, Ill.; Thomas J. McElhenny, Austin, Texas, and Dean F. Smiley, Chicago.

Dr. Arthur F. Abt, Chicago, read a paper on "Aplastic Anemia in Children, Report of a Case with Treatment by Splenectomy." Discussed by Drs. Michael Pierce, Chicago, and John E. Cassidy, Washington, D. C.

Dr. Abraham Levinson, Chicago, read a paper on "Streptomycin Therapy in Tuberculous Meningitis." Discussed by Drs. W. W. Bryant Jr., Pittsburgh; Gilbert J. Levy, Memphis, Tenn., and William S. Hoffman, Chicago.

Dr. Sidney A. Portis, Chicago, read a paper on "Newer Concepts of the Etiology and Management of Idiopathic Ulcerative Colitis." Discussed by Drs. Robert J. Coffey, Washington, D. C.; Peter D. Comanduras, Arlington, Va., and Franz G. Alexander, Chicago.

Friday, June 25—Morning

A joint meeting was held with the Section on Obstetrics and Gynecology.

The following papers were read in a panel discussion on "Fetal Anoxia at Birth," Dr. C. Anderson Aldrich, Rochester, Minn., moderator.

Dr. Clement A. Smith, Boston: "Physiologic Background of Fetal Anoxia at Birth and Cyanosis of the Newborn."

Dr. Nicholson J. Eastman, Baltimore: "Prevention of Fetal Anoxia at Birth and Cyanosis of the Newborn."

Dr. Stewart H. Clifford, Boston: "Differential Diagnosis and Management of Fetal Anoxia at Birth and Cyanosis of the Newborn."

Dr. W. W. Zuelzer, Detroit: "Pathology of Conditions in which Fetal Anoxia at Birth and Cyanosis of the Newborn are an Outstanding Feature."

Dr. Edwin L. Kendig, Richmond, Va., read a paper on "A Misconception Concerning the Rh Factor and the Interruption of Pregnancy." Discussed by Drs. S. A. Cosgrove, Jersey City, N. J., and John C. Hughes, Pittsburgh.

Dr. M. Hines Roberts, Atlanta, Ga., read a paper on "Emergencies Encountered in the Neonatal Period." Discussed by Drs. Fred L. Adair, Chesterton, Ind., and Nina A. Anderson, Cincinnati.

Dr. Harold W. Dargeon, New York, read a paper on "Ovarian Tumors in Childhood." Discussed by Drs. Goodrich C. Schauffler, Portland, Ore., and Howard T. Karsner, Cleveland.

SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

Wednesday, June 23—Morning

The meeting was called to order at 9:20 o'clock by the chairman, Dr. Walter Bauer, Boston.

Dr. Frederick J. Stare, Boston, read a paper on "Fat in Parenteral Nutrition." Discussed by Drs. Smith Freeman, Chicago; Jerome W. Conn, Ann Arbor, Mich., and Walter Bauer, Boston.

Drs. Michael G. Wohl, John G. Reinhold, S. Brandt Rose, L. Ashby Adams and Moses Francis, Philadelphia, presented a paper on "Antibody Response in Patients with Hypoproteinemia, with Special Reference to the Effect of Protein and Protein Hydrolysate Supplementation." Discussed by Dr. Paul R. Cannon, Chicago.

Dr. Jerome W. Conn, Ann Arbor, Mich., presented a paper on "Clinical Significance of the Electrolyte Composition of Sweat in Abnormalities of Adrenal Cortical Function." Discussed by Drs. Benjamin F. Sieve, Boston, and J. G. G. Borst, Amsterdam, Holland.

Drs. Wesley W. Spink, Wendell H. Hall, James M. Shaffer and Abraham I. Braude, Minneapolis, presented a paper on "The Specific Treatment of Brucellosis with a Combination of Streptomycin and a Sulfonamide Compound." Discussed by Drs. C. Wesley Eisele, Chicago, Max Michael, Atlanta, Ga., and Walter Bauer, Boston.

Drs. Benedict F. Massell, James W. Dow and T. Duckett Jones, Boston, presented a paper on "Studies Concerning Oral Penicillin in Patients with Rheumatic Fever." Discussed by Drs. Wesley W. Spink, Minneapolis, and Walter Bauer, Boston.

Drs. Leo Loewe, Albert E. Sobel and Erna Alturr-Werber, Brooklyn, presented a paper on "New Penicillin Products for Sustained Effects." Discussed by Drs. Donald R. Nichols, Rochester, Minn., and Harry F. Dowling, Washington, D. C.

Thursday, June 24—Morning

The following officers were elected: chairman, Dr. Dwight L. Wilbur, San Francisco; vice chairman, Dr. McKeen Cattell, New York; secretary, Dr. Carl V. Moore, St. Louis; delegate: Dr. Edgar V. Allen, Rochester, Minn ; alternate, Dr. Charles M. Gruber, Philadelphia; representative to Scientific Exhibit: Dr. Robert W. Wilkins, Boston.

Dr. Walter Bauer, Boston, read the chairman's address, entitled, "The Importance of a Comprehensive Approach in the Treatment of Rheumatoid Arthritis."

Dr. L. T. Coggeshall, Chicago, read a paper on "The Cure of Recurrent Vivax Malaria with Pentaquine." Discussed by Dr. Alf S. Alving, Chicago.

Dr. Louis K. Diamond, Boston, read a paper on "The Use of Antihemophilic Fraction in the Treatment of Hemophilia." Discussed by Dr. Carl V. Moore, St. Louis.

Drs. Myron Prinzmetal, Eliot Corday, Ramon Spritzler and H. C. Bergman, Los Angeles, presented a paper on "Radiocardiography: A Method for Visualizing the Flow of Blood Through the Heart Utilizing Radioactive Isotopes." Discussed by Drs. Nylin, Stockholm; W. D. Mayer, Detroit, and Louis J. Voorhas, Chicago.

Drs. Hans H. Hecht and Ferne S. Focht, Salt Lake City, presented a paper on "The Influence of "Dibenamine" on the Function of the Sympathetic Nervous System in Man." Discussed by Dr. James P. Hendrix, Durham, N. C.

Friday, June 25—Morning

A joint meeting was held with the Section on Internal Medicine.

Drs. Irving S. Wright and Charles D. Marple, New York, presented "Report of Committee for the Evaluation of the Use of Anticoagulants in the Treatment of Coronary Thrombosis with Myocardial Infarction." Discussed by Drs. Bernard Drexler, Rochester, N. Y., and Walter Vest, Huntington, W. Va.

Dr. Irvine H. Page, Cleveland, read a paper on "Pathogenesis of Arterial Hypertension." Discussed by Dr. Carlos Jimenez Diaz, Madrid, Spain.

Diagnosis of Diaphragmatic Hernia and Coronary Artery Disease."

These three papers were discussed by Drs. Ralph C. Brown, Chicago; Manfred Kraemer, Newark, N. J.; Donovan C. Browne, New Orleans; Kenneth A. Crockett, Salt Lake City; Irving B. Brick, Washington, D. C., and Arthur M. Master, New York.

Drs. Henry J. Tumen and Edwin M. Cohn, Philadelphia, presented a paper on "Heartburn." Discussed by Drs. David J. Sandweiss, Detroit; John H. Fitzgibbon, Portland, Ore.; Anthony J. Bassler, New York; Sidney A. Portis, Chicago; Hyman I. Goldstein, Camden, N. J., and Henry J. Tumen, Philadelphia.

Drs. David Adlersberg and Ernst Hammerschlag, New York, presented a paper on "Studies on the Mechanism of Postgastrectomy Syndrome." Discussed by Drs. Ralph Colp, New York; Joseph B. Kirsner, Chicago; Otto Porges, Chicago; Thomas E. Machella, Philadelphia; H. Necheles, Chicago; Hyman I. Goldstein, Camden, N. J., and David Adlersberg, New York.

Drs. Malcolm Block and Henry C. Bryant, Ann Arbor, Mich., presented a paper on "The Diagnosis of Gastric Neoplasm by Cytologic Examination of Gastric Secretions." Discussed by Drs. Warren C. Hunter, Portland, Ore.; Frank Fremont-Smith, Boston, and Malcolm Block, Ann Arbor, Mich.

Drs. William D. Gambill, John E. Fisher, Bernard D. Rosenak and Rollin H. Moser, Indianapolis, presented a paper on "A Study of the Routine Use of Screening for the Detection of Liver Disease."

Drs. Leon Schiff, S. A. Safdi, R. C. Cogswell, C. W. Kumpe, D. F. Richfield and E. A. Gall, Cincinnati, presented a paper on "Needle Biopsy of the Liver."

These two papers were discussed by Drs. Hugh R. Butt, Rochester, Minn.; E. E. Mandel, Chicago; Frederick W. Hoffbauer, Minneapolis; Hans P. Popper, Chicago; Sheila Sherlock, London, England; William D. Gambill, Indianapolis, and Leon Schiff, Cincinnati.

Thursday, June 24—Morning

The following officers were elected: chairman, Dr. William H. Daniel, Los Angeles; vice chairman, Dr. Russell S. Boles, Philadelphia; secretary, Dr. Grant H. Laing, Chicago; delegate, Dr. Louis A. Buie, Rochester, Minn.; alternate, Dr. Walter A. Fansler, Minneapolis.

Dr. Sara M. Jordan, Boston, read the chairman's address, entitled "Correlation of Gastroenterology and Surgery."

Dr. Milton Plotz, Brooklyn, read a paper on "Possible Hazards of Diets High in Cholesterol in Coronary Disease." Discussed by Drs. Louis N. Katz and Walter L. Palmer, Chicago, and Milton Plotz, Brooklyn.

Dr. Garnet W. Ault, Washington, D. C., read a paper on "The Surgical Treatment of Ulcerative Colitis." Discussed by Drs. Clarence Dennis, Minneapolis; Joseph Bank, Phoenix, Ariz.; Joseph B. Kirsner, Chicago, and Garnet W. Ault, Washington, D. C.

Dr. Thomas E. Machella, Philadelphia, read a paper on "Treatment of Idiopathic Ulcerative Colitis by Means of a Medical Ileostomy and Orally Administered Protein Hydrolysate Solution." Discussed by Drs. T. Grier Miller, Philadelphia; Sidney A. Portis, Chicago; Hyman I. Goldstein, Camden, N. J.; Manfred Kraemer, Newark, N. J., and Thomas E. Machella, Philadelphia.

Drs. Malcolm R. Hill, Carroll S. Small and Lee Richards, Los Angeles, presented a paper on "A Study of the Development of Anal Ducts and Glands, With Particular Reference to the Pathogenesis of Anorectal Disease." Discussed by Drs. Claude C. Tucker, Wichita, Kan.; J. P. Nesselrod, Evanston, Ill.; Edward Levy, New York, and Malcolm R. Hill, Los Angeles.

Drs. Emil Granet, M. B. Kagan and Cyril Solomon, New York, presented a paper on "Lymphomas of the Anorectum." Discussed by Drs. Walter A. Fansler, Minneapolis; Claude C. Tucker, Wichita, Kan., and Emil Granet, New York.

Drs. Elmer H. Loughlin and Samuel H. Spitz, Brooklyn, presented a paper on "The Diagnosis of Intestinal Helminth Infections." Discussed by Drs. Norman R. Stoll, Princeton, N. J.; Donovan C. Browne, New Orleans, and Elmer H. Loughlin, Brooklyn.

Drs. John R. Hill and Louis A. Buie, Rochester, Minn., presented a paper on "Polypoid Lesions of the Terminal Portion of the Colon with Special Relationship to Fulguration." Discussed by Drs. Martin S. Kleckner, Allentown, Pa., and John R. Hill, Rochester, Minn.

Friday, June 25—Morning

A joint meeting was held with the Section on Surgery, General and Abdominal. The proceedings are reported in the minutes of that section.

SECTION ON RADIOLOGY

Wednesday, June 23—Morning

The meeting was called to order at 9:10 o'clock by the chairman, Dr. W. Walter Wasson, Denver.

Dr. U. V. Portmann and Dr. E. C. Ernst, as delegate and alternate, respectively, were approved to represent the Section at the International Congress of Radiology in London in 1950.

Dr. W. Walter Wasson, Denver, read the chairman's address, entitled "What Further Contributions Can Radiology Make to Medicine?"

Dr. Lee A. Hadley, Syracuse, N. Y., read a paper on "Intervertebral Foramen Studies." Discussed by Dr. L. Henry Garland, San Francisco, and Dr. Henry Briggs, East Orange, N. J.

Dr. William Snow, New York, read a paper on "A Basic Analysis of the Obstetric Pelvis by Roentgen Study." Discussed by Dr. J. P. Greenhill, Chicago; Dr. Howard P. Doub, Detroit, and Dr. Ross Golden, New York.

Dr. Charles T. Dotter, New York, read a paper on "Angiocardiographic Visualization of the Pulmonary Artery in Health and Disease." Discussed by Dr. Harry M. Weber, Rochester, Minn.; Dr. Leo Rigler, Minneapolis, and Dr. J. E. Miller, Dallas, Texas.

Dr. Maurice Lenz, New York, read a paper on "Lymphosarcoma: Its Diagnosis and Treatment." Discussed by Dr. Edward L. Jenkinson, Chicago; Dr. T. Leucutia, Detroit; Dr. Ellis Berven, Stockholm, Sweden; Dr. William Klein, New Brunswick, N. J., and Dr. David S. Dann, Kansas City, Mo.

Dr. Ellis Berven, Stockholm, Sweden, read a paper on "Treatment of Malignant Tumors of the Maxillary Antrum." Discussed by Dr. O. E. Van Alyea, Chicago.

Thursday, June 24—Morning

The following officers were elected: chairman, Harry M. Weber, Rochester, Minn.; vice chairman, U. V. Portmann, Cleveland; Secretary, Paul Hodges, Chicago; delegate, B. R. Kirklin, Rochester, Minn.; alternate, E. P. Pendergrass, Philadelphia; representative of the Section on the American Board of Radiology, E. L. Jenkinson, Chicago.

Dr. Juliette Baud, Paris, France, read a paper on "Treatment of Stage I Carcinoma of the Cervix by Intracavitary Radium: Five, Ten and Fifteen Year End Results." Discussed by Drs. Harry H. Bowing, Rochester, Minn., and E. C. Ernst, St. Louis.

Dr. Constance A. P. Wood, London, England, read a paper on "Some Factors Influencing the Response of Cancer of the Mouth and Throat to Radiation." Discussed by Drs. Douglas Quick, New York; Charles L. Martin, Dallas, Texas, and B. W. Windeyer, London, England.

Dr. Francois Baclesse, Paris, France, read a paper on "Roentgen Therapy of Cancer of the Hypopharynx." Discussed by Dr. Juan A. del Regato, Columbia, Mo., and Dr. Maurice Lenz, New York.

Sir Stanford Cade, London, England, read a paper on "Treatment and Results in Cancer of the Breast." Discussed by Drs. U. V. Portmann, Cleveland; Robert J. Reeves, Durham, N. C.; Henry Ullmann, Santa Barbara, Calif.; Robert S. Newell, San Francisco, and Constance A. P. Wood, London, England.

Dr. B. W. Windeyer, London, England, read a paper on "The Present Position of Radiotherapy in Medical Practice." Discussed by Dr. Robert R. Newell, San Francisco, and Dr. Frederick W. O'Brien, Boston.

Friday, June 25—Morning

The Section met jointly with the Section on Preventive and Industrial Medicine and Public Health. The meeting was called to order by W. Walter Wasson, Denver, chairman of the Section.

Dr. Willard F. Machle, New York, read a paper on "Chemical and Clinical Aspects of Beryllium."

Dr. Arthur J. Vorwald, Saranac, N. Y., read a paper on "Pathologic Aspects of Beryllium."

Dr. Stanley A. Wilson, Salem, Mass., read a paper on "Radiologic Aspects of Beryllium."

Dr. Walter M. Anderson, Lompoc, Calif., read a paper on "Clinical Aspects, Diatomaceous Earth."

Dr. William H. Carnes, Baltimore, read a paper on "Pathologic Aspects, Diatomaceous Earth."

Dr. Reginald H. Smart, Los Angeles, read a paper on "Radiologic Aspects, Diatomaceous Earth."

Dr. C. M. Jephcott, Toronto, Canada, read a paper on "Chemical and Physical Factors, Bauxite (Shaver's Disease)."

Dr. A. R. Riddell, Toronto, Canada, read a paper on "Pathologic Aspects, Bauxite (Shaver's Disease)."

Dr. C. G. Shaver, Niagara, Canada, read a paper on "Clinical and Radiologic Aspects, Bauxite (Shaver's Disease)."

A panel discussion and question and answer period was held, with audience participation, with Dr. Arthur J. Vorwald, Saranac, N. Y., as moderator, and the contributors to the joint program as speakers.

SECTION ON ANESTHESIOLOGY

Wednesday, June 23—Afternoon

The meeting was called to order at 2 o'clock by the chairman, Dr. Ralph M. Tovell, Hartford, Conn.

Drs. Henry S. Ruth, Haverford, Pa., and Frederick P. T. Haugen, Philadelphia, presented a "Preliminary Report of Committee on Operative Mortality."

Dr. Ralph M. Tovell, Hartford, Conn., read the chairman's address, entitled "Anesthesiology in the Veterans Administration."

Dr. Henry S. Ruth, Haverford, Pa., reported briefly as delegate.

Dr. Paul M. Wood, New York, read a paper on "The Functions of the American Board of Anesthesiology, Past, Present and Future." Discussed by Dr. Philip D. Woodbridge, Reading, Pa.

Drs. John J. Bonica, Tacoma, Wash., Daniel C. Moore, Seattle, and Morton Orlov, Tacoma, Wash., presented a paper on "Brachial Plexus Block Anesthesia." Discussed by Drs. Robert L. Patterson, Pittsburgh; W. Allen Conroy, Chicago; Daniel C. Moore, Seattle, and John J. Bonica, Tacoma, Wash.

Thursday, June 24—Afternoon

The following officers were elected: chairman, Walter C. Metz, Denver; vice chairman, Urban Eversole, Boston; delegate, Henry S. Ruth, Haverford, Pa.; alternate, R. J. Whitacre, East Cleveland, Ohio; representative to Scientific Exhibit, Harold Bishop, Valhalla, N. Y.; chairman, Committee on Operative Mortality, Frederick P. T. Haugen, Philadelphia; committee members, J. E. Remlinger, Evanston, Ill., and Henry S. Ruth, Haverford, Pa.

Dr. Albert Faulconer Jr., Rochester, Minn., read a paper on "An Acoustic Gas Analyser for Research in Anesthesiology." Discussed by Dr. Charles D. Anderson and Dr. Mary Karp, Chicago.

Drs. Jane E. Denton, O. H. Strauss and H. K. Beecher, Boston, presented a paper on "A Clinical Appraisal of Methadon ('Amidone') and Its Isomers." Discussed by Lieut. Scott Whitehouse, (MC) USNR; Major Charles H. Mitchell, Medical Corps, United States Army and Dr. Henry K. Beecher, Boston.

Dr. K. K. Keown, Philadelphia, read a paper on "Anesthetic Complications During and Following Chest Surgery." Discussed by Drs. W. O. McQuiston, Peoria, Ill.; Dr. Ansel M. Caine, New Orleans, and Dr. Ralph M. Tovell, Hartford, Conn.

Drs. H. A. Bennett, Oklahoma City, and S. C. Cullen, Iowa City, presented a paper on "The Effects of Various Methods of Premedication and Technics of Anesthesia as Related to the Minute Volume Exchange." Discussed by Dr. Curtiss B. Hickcox, Philadelphia; Dr. Paul H. Lorhan, Mission, Kan.; Dr. Philip Woodbridge, Reading, Pa.; Dr. E. M. Papper, New York; Dr. Stuart C. Cullen, Iowa City, and Dr. Ivan B. Taylor, Detroit.

Dr. G. W. Curry, Cleveland, read a paper on "Caudal Sympathetic Block: A Comparison with Lumbar Sympathetic Block." Discussed by Dr. Ivan B. Taylor, Detroit; Dr. Stuart C. Cullen, Iowa City, and Dr. Bruce Anderson, Oakland, Calif.

Friday, June 25—Afternoon

Dr. J. L. Bollman, Rochester, Minn., read a paper on "Laboratory Studies with Radioactive Pentothal." Discussed by Dr. Richard K. Richards, Chicago, and Dr. Edward B. Tuohy, Washington, D. C.

Dr. Bruce M. Anderson, Oakland, Calif., read a paper on "Observations on the Use of Pentothal Sodium in Presence of Hepatic Damage." Discussed by Drs. W. Allen Conroy, and Richard K. Richards, Chicago; Dr. J. L. Bollman, Rochester, Minn., and Dr. Huberta M. Livingstone, Chicago.

Drs. L. S. Goodman, H. O. Brown, Mark Nickerson and S. M. Smith, Salt Lake City, read a paper on "Dibenamine Protection Against Cyclopropane Arrhythmias; Clinical Study with Continuous Electrocardiographic Recordings." Discussed by Drs. A. E. Rapoport, Chicago, and R. J. Whitacre, East Cleveland, Ohio.

SECTION ON GENERAL PRACTICE

Wednesday, June 23—Afternoon

A joint meeting was held with the Section on Preventive and Industrial Medicine and Public Health. The meeting was called to order at 2 o'clock by the chairman, Dr. Eric A. Royston, Los Angeles.

Dr. Leonard Greenburg, New York, read a paper on "Diagnosis and Treatment of Occupational Metal Poisoning."

Dr. Elston L. Belknap, Milwaukee, read a paper on "Lead: The Differential Diagnosis of Lead Poisoning; Accepted Laboratory Criteria."

Dr. William C. Wilentz, Perth Amboy, N. J., read a paper on "The Treatment of Lead Poisoning (Should One Attempt to 'Store Lead' or to 'Delead'?)."

Dr. John H. Foulger, Wilmington, Del., read a paper on "The Industrial Solvents: Their Physiologic Effect."

Dr. Rex H. Wilson, Akron, Ohio, read a paper on "Diagnosis and Treatment."

Dr. L. E. Hamlin, Chicago, read a paper on "The Pneumoconioses: Which Industrial Dusts Are Inert? Which are Harmful? Why?"

Dr. N. P. Anderson, Los Angeles, read a paper on "Common Occupational Skin Disease."

There followed a panel discussion and question and answer period, with audience participation, with Dr. R. T. Johnstone, Los Angeles, as moderator, and the contributors to the joint program, and Oscar A. Sander, Milwaukee, as speakers.

Thursday, June 24—Afternoon

The following officers were elected: chairman, Dr. Winfred B. Harm, Detroit; vice chairman, Dr. Milton B. Casebolt, Kansas City, Mo.; secretary, Dr. Thomas E. Robinson, Salt Lake City; delegate, Dr. Paul A. Davis, Akron, Ohio; alternate, Dr. L. C. Burwell, Los Angeles.

Dr. Eric A. Royston, Los Angeles, read the chairman's address, entitled "The Renaissance of the General Practitioner."

Dr. Marion S. DeWeese, Ann Arbor, Mich., read a paper on "Extraocular Malignant Melanoblastoma: A Clinical Study." Discussed by Drs. S. William Becker, Chicago, and Marion S. DeWeese, Ann Arbor, Mich.

Dr. Bruce H. Douglas, Detroit, read a paper on "The Private Physician and Preventive Medicine." Discussed by Dr. Paul A. Davis, Akron, Ohio.

Dr. Lawrence T. Post, St. Louis, read a paper on "The Diagnostic Significance of Failing Vision." Discussed by Drs. Paul O. Hageman, St. Louis, and Dr. Lawrence T. Post, St. Louis.

Drs. Frank N. Allan and Manuel Kaufman, Boston, presented a paper on "The Nervous Factor in General Practice." Discussed by Dr. John B. Dynes, Boston.

Friday, June 25—Afternoon

Dr. Philip Thorek, Chicago, read a paper on "The Do's and Don'ts of the Acute Abdomen." Discussed by Drs. John Van Probaska, Chicago; Joseph B. Kirsner, Chicago, and Philip Thorek, Chicago.

Dr. S. Allen Wilkinson, Boston, read a paper on "The Present Status of the Peptic Ulcer Problem." Discussed by Drs. Wingate M. Johnson, Winston-Salem, N. C., and S. Allen Wilkinson, Boston.

Dr. Richard Z. Query, Jr., Charlotte, N. C., read a paper on "Rheumatoid Spondylitis: Its Early Diagnostic Features and Management." Discussed by Drs. Edward F. Rosenberg, Chicago; Richard D. Smith, Philadelphia, and Richard Z. Query Jr., Charlotte, N. C.

Drs. William P. Boger and Harrison F. Flippin, Philadelphia, presented a paper on "The Increase and Prolongation of Penicillin Plasma Concentration." Discussed by Drs. Wallace E. Herrell, Rochester, Minn., and William P. Boger, Philadelphia.

Drs William L. Proudfit and A. Carlton Ernstene, Cleveland, presented a paper on "Diagnosis of Coarctation of the Aorta." Discussed by Drs. O. T. Clagett, Rochester, Minn., and William L. Proudfit, Cleveland.

Dr. Edward T. Tyler, Los Angeles, read a paper on "The Use and Misuse of Endocrine Therapy in Sterility." Discussed by Dr. Willard O. Thompson, Chicago.

SECTION ON MISCELLANEOUS TOPICS

Session on Allergy

Wednesday, June 23—Morning

The meeting was called to order at 9:15 o'clock by the chairman, Dr. Francis M. Rackemann, Boston.

Dr. Rackemann gave the chairman's address.

Dr. Frank A. Simon, Louisville, Ky., read a paper on, "Some Basic Facts and Problems of Clinical Allergy." Discussed by Dr. Jiminez Diaz of Madrid, Spain.

Dr. F. B. Schutzbank, Tucson, Ariz., read a paper on "Climatotherapy in the Treatment of Allergic Diseases." Discussed by Drs. O. E. Egbert, El Paso, Texas; Marion B. Sulzberger, New York; Leon Unger, Chicago; Stanley Hampton, St. Louis, and J. A. Rudolph, Miami Beach, Fla.

Dr. Lewis Webb Hill, Boston, read a paper on "An Evaluation of Therapy in Infantile Eczema." Discussed by Dr. A. V. Stoesser, Minneapolis.

Dr. W. B. Sherman, New York, read a paper on "Allergy to Drugs." Discussed by Drs. Marion Sulzberger, New York; Howard Osgood, Buffalo; Theodore Squier, Milwaukee, and J. A. Rudolph, Miami Beach, Fla.

Drs. Gustave J. Dammin and Samuel C. Bukantz, St. Louis, presented a paper on "Immunologic and Morphologic Alterations in Hypersensitive States." Discussed by Dr. Samuel M. Feinberg, Chicago.

Dr. John M. Sheldon, Ann Arbor, Mich., read a paper on "The Use of Intravenous Fluids in Bronchial Asthma." Discussed by Drs. J. W. Thomas, Richmond, Va., and Eugene Foldes, New York.

Dr. Stearns S. Bullen, Rochester, N. Y., read a paper on "What Should the General Practitioner Know About Allergy?" Discussed by Dr. John H. Mitchell, Columbus, Ohio.

Session on Diseases of the Chest

Thursday, June 24—Morning

The meeting was called to order at 9:05 o'clock by the chairman, Dr. Richard H. Overholt, Boston.

Dr. Emil Bogen, Los Angeles, read a paper on "Laboratory Aspects of Streptomycin." Discussed by Dr. Allen Hurst, Denver.

Dr. H. C. Hinshaw, Rochester, Minn., read a paper on "Streptomycin in Extrapulmonary Tuberculosis." Discussed by Drs. Abel Froman, Chicago; Peter Amazon, Brooklyn; Jean Rafael Herradora-Ubeda, Jersey City, N. J., and W. L. Howard, Northville, Mich.

Dr. Karl Pfuetze of Cannon Falls, Minnesota, read a paper on, "Streptomycin in Treatment of Tuberculosis." Discussed by Drs. George Ornstein, New York; Donato Alarcon, México, D. F.; Benjamin Potter, Jersey City, N. J.; H. G. Trimble, Oakland, Calif.; Abel Froman, Chicago, and Morris Braverman, Detroit.

Dr. William Tucker, Minneapolis, read a paper on "Experience with Treatment of Various Forms of Tuberculosis with Streptomycin in Veterans Administration." Discussed by Dr. Karl Pfuetze, Cannon Falls, Minn.

Dr. Edward J. Beattie, St. Louis, read a paper on "The Use of Streptomycin in Surgical Patients." Discussed by Drs. Emil Bogen, Los Angeles, and Richard H. Overholt, Boston.

Dr. Chester S. Keefer, Boston, read a paper on "Antibiotics in Relation to Nontuberculous Diseases of the Chest."

Session on Physical Medicine

Thursday, June 24—Morning

The meeting was called to order at 9:00 by the chairman, Dr. George Morris Piersol, Philadelphia.

Dr. Harold Dinken, Denver, read a paper on "The Physical Treatment of the Hemiplegic Patient in General Practice." Discussed by Dr. Sedgwick Mead, St. Louis; Dr. Isador Blum, Newark, N. J., and Dr. G. J. Boines of Wilmington, Del.

Drs. Khalil G. Wakim, Julia F. Herrick, Gordon M. Martin and Frank H. Krusen, Rochester, Minn., presented a paper on "Therapeutic Possibilities of Microwaves." Discussed by Drs. Harold Dinken, Denver; Jerome Weiss, Brooklyn; David Kling, Los Angeles, Emile Brunor, New York and Louis Newman.

Dr. Howard A. Rusk, New York, read a paper on "Rehabilitation and General Practice." Discussed by Drs. Sedgwick Mead, St. Louis, and Jerome Weiss, Brooklyn.

Dr. Winfred Overholser, Washington, D. C., read a paper on "Psychiatric Aspects of Physical Medicine."

In a panel discussion on "Physical Medicine in General Practice," with Dr. George M. Piersol, *Philadelphia*, as moderator, the following papers were read:

Dr. Frances Baker, San Francisco: "Physical Treatment of Common Disorders of the Feet."

Dr. Frederic J. Kottke, Minneapolis: "Physical Treatment of Backache."

Dr. Robert L. Bennett, Warm Springs, Ga.: "Physical Treatment of Poliomyelitis."

Dr. Sedgwick Mead, St. Louis: "Physical Treatment of Peripheral Vascular Diseases."

Dr. Donald L. Rose, Kansas City, Kan.: "Physical Treatment of Shoulder Lesions."

Session on History of Medicine

Friday, June 25—Morning

The meeting was called to order by the chairman, Dr. Howard Dittrick, Cleveland.

Dr. William J. Mixter, Boston, read a paper on "Rupture of the Intervertebral Disk: A Short History of Its Evolution as a Syndrome of Importance to the Surgeon." Discussed by Drs. Philip Lewin, Chicago, and William J. Mixter, Boston.

Dr. John R. Paine, Buffalo, read a paper on "Continuous Suction Drainage in the Treatment of Intestinal Obstruction: A Historical Evaluation."

Dr. T. Grier Miller, Philadelphia, read a paper on "The Development of Intestinal Intubation as a Practical Clinical Procedure: Introduction of the Double Lumen Tube."

These two papers were discussed by Dr. William J. Mixter, Boston.

Dr. Barnes Woodhall, Durham, N. C., read a paper on "Modern Historical Aspects of Peripheral Nerve Surgery." Discussed by Dr. William J. Mixter, Boston.

Dr. E. B. Astwood, Boston, read a paper on "Recent Developments in Antithyroid Drugs."

Dr. Rudolph Nissen, New York, read a paper on "The First Successful Pneumonectomy and Its Historical Significance." Discussed by Dr. Josiah C. Trent, Durham, N. C.

Washington Letter

(From a Special Correspondent)

July 14, 1948.

Poliomyelitis Cases Maintain Slow but Steady Increase

The unspectacular but steady gain in poliomyelitis incidence continues, according to reports reaching the United States Public Health Service. During the week ended July 3, there were 362 cases throughout the country, compared with 309 for the previous seven day period. A noteworthy fact was that, while Texas remained among the three states which have been hit hardest so far this year (California, North Carolina and Texas account for 64 per cent of the total cases), its weekly report was lower than the previous week's. The other two states, however, showed increases. Heaviest concentration of cases in North Carolina is in the western portion, with Guilford County bearing the brunt. In its weekly morbidity report, the United States Public Health Service called attention to the fact that the seven day period ended July 3 was the sixth consecutive week in which not one case of smallpox had been reported.

Civil Defense Medical Plan Completed

A comprehensive plan for utilization of members of the medical and allied professions in event of an enemy attack on this country's civilian population was approved by the medical advisory committee to the Office of Civil Defense Planning, which met on July 6. The blueprint has been submitted to Russell J. Hopley, director, for final approval.

Between the May and July meetings of the advisory group, Dr. Perrin H. Long, professor of preventive medicine at Johns Hopkins University and medical advisor to the Office of Civil Defense Planning, had worked on a draft of the manpower utilization blueprint. Its details are being withheld, pending completion and release of plans involving other aspects of the civil defense problem. Their publication is not expected before fall.

The following members of the *medical advisory committee* attended the July 6 meeting: Brig. Gen. J. M. Hargreaves, Col. E. S. Standlee, Capt. C. C. Myers, Lieut. Col. K. E. Baltz, Dr. Bruce H. Douglas, Dr. C. W. Camalier, Dr. W. R. Krill, Dr. R. P. Fischelis, Rev. Donald A. MacGowan, Dr. R. L. Sensenich, Dr. F. Wilson, Dr. P. S. Owen, Dr. R. B. Snavely, Miss Margaret Arnstein, Dr. E. F. Daily, Dr. Norvin C. Kiefer and Dr. E. H. Cushing.

Industrial Medicine and Defense Conference

The close relation between industrial health problems and national defense was the subject of a special conference held here July 7-8, sponsored by the Office of Defense in cooperation with the American Medical Association. No action was taken, nor were any policies recommended by the informally organized group, whose members included Drs. R. L. Sensenich, Carl M. Peterson and Richard L. Meiling, of the American Medical Association.

"In the event of another war," said an announcement on the meeting by Secretary of Defense James Forrestal, "the success of an industrial health program, now universally recognized as a vital factor in civil defense, would depend largely on complete coordination of military and civil work in this field. A vast research program to determine what personnel and supplies would be needed and just how much of these are now available must be completed before plans to meet a war emergency can be crystallized. The conference [was] held to integrate further the work of the various interested agencies and to initiate the research that remains to be done."

The conferees, during the two day meeting, heard spokesmen for the following government agencies: Army, Navy, Air Force, Public Health Service, Munitions Board, Office of Civil Defense Planning and National Security Resources Board. Their final afternoon session was held at the Brookings Institution, where they were informed of progress of that organization's investigation of certain health and welfare functions of the federal government.

Others in attendance at the conference were Drs. C. W. Camalier, American Dental Association; A. J. Lanza, Metropolitan Life Insurance Co.; Harold A. Vonachen, Caterpillar Tractor Co.; Edward C. Holmblad, American Association of Industrial Physicians and Surgeons, and Tom Hendricks, Council on Medical Service, American Medical Association.

Army Officers Receive Advanced Degrees

Members of the medical department are amply represented among two hundred and eighty-one Army officers who received degrees from graduate schools of civilian institutions during the academic year just ended. Seven earned the degree of Master of Public Health, five, Master of Science and one each, Master of Hospital Administration and Master of Business Administration. One doctorate, in psychology, was awarded, according to the Army's announcement.

Federal Security Agency Regional Offices Established

Further centralizing functions of Federal Security Agency, in the field as well as at Washington headquarters, ten regional offices have been established, according to an announcement. The step is the latest in the plan to deemphasize the agency's various units—*Public Health Service, Food and Drug Administration*, Office of Vocational Rehabilitation, Children's Bureau, Social Security Administration, Office of Education and Bureau of Employes' Compensation—and build up the parent agency's central function. Regional directors and their headquarters cities are as follows: John F. Hardy, I, Boston; Joseph B. O'Connor, II, New York City; Erval R. Coffe, III, Richmond; J. Kimball Johnson, IV, Cleveland; Ed McDonald, V, Chicago; Richard H. Lyle, VI, Atlanta; James W. Doarn, VII, Kansas City; James H. Bond, VIII, Dallas; Heber R. Harper, IX, Denver, and Fay W. Hunter, X, San Francisco.

Program for Distribution of Tagged Chemicals Announced

The Atomic Energy Commission has announced plans for production and distribution of certain chemicals tagged with radioactive elements in order to stimulate their use in medical and industrial research. Heretofore, radioisotopes have been available from Oak Ridge National Laboratory but investigators desiring "tagged" compounds have had to prepare them themselves. Further information on procurement is obtainable from Isotopes Division, Atomic Energy Commission, P. O. Box E, Oak Ridge, Tenn.

Medical Officers Called to Discuss Manpower Retrenchment

Surgeons of the six field Armies and of fourteen Air Force Commands were scheduled to assemble in Washington July 13 and 14 to discuss means of conserving medical manpower, in view of the additional burden which will ensue this fall when selective service goes into effect. The Army Surgeon General is not expected to return from Europe until late July, and the critical situation faced by the Army medical department was to be explained to the Army and Air Force surgeons by Brig. Gen. G. E. Armstrong, Deputy Surgeon General.

Numerical Importance of Fractures Among Naval Personnel Disclosed

The major role borne by the diagnosis simple fracture is attested by a statistical study published in "Statistics of Navy Medicine" for July. It reveals that during the war years simple fractures resulted in 4,500,000 sick days in the Navy and Marine Corps, a total surpassed only by the number of sick days due to common cold and other infections of the respiratory tract blanketed by the term "catarrhal fever." Between 1942 and 1945, inclusive, 104,820 simple fracture cases were handled, an incidence rate of 1,051 per 100,000.

By anatomic regions, bones of the lower extremity had the highest fracture incidence, testifying to the commonness of shipboard falls down hatchways. This group accounted for 36 per cent of all simple fractures recorded. Of the total of 104,820 cases, only 1,617 led to medical discharge (1.5 per cent). Deaths attributable to fracture origin were almost negligible, with the conspicuous exception of skull fractures. There were 1,460 such cases, of which 517 (35 per cent) terminated fatally.

ARMY

CONFERENCE TO CORRELATE REHABILITATION

Representatives of three armed services and two government agencies met in the office of the Army Surgeon General on June 28 for the benefit of crippled servicemen, ex-servicemen and civilians. A conference on physical medicine and rehabilitation will be held then to plan correlation of all government medical efforts in that field. Participating will be the Army, Navy, Air Forces, Veterans Administration and U.S. Public Health Service, together with civilian consultants of each. Among those participating will be Dr. Frank H. Krusen, director of the Baruch Committee on Physical Medicine. Dr. Krusen is a consultant for both the Army and the Veterans Administration. Armed services conferees will be representatives of the physical medicine units of each agency, led by Lieut. Col. B.A. Strickland Jr., chief of the physical medicine consultants division of the Army Medical Corps.

THE ARMY'S NEW SCHOOL CATALOG

The 523 page booklet entitled "The Army School Catalog," which has just come off the government printing press, confirms Secretary of the Army Royall's statement that education is big business in the Army. The book (Department of the Army Pamphlet no. 20-21) contains information about the one hundred and thirty-six courses available for Army officers and the one hundred and ninety-eight courses available for enlisted personnel in the Army's vast educational system, ranging from neuropsychiatric nursing to courses as far from the field of medicine. The prerequisites for each course are outlined in detail. The director of the Personnel and Administration Division of the Army, Lieut. Gen. Willard S. Paul, said, "The Army School Catalog will become a most important tool in the career guidance program of the Army. Here for the first time in one publication is that vast array of school training open to officers and enlisted men. It will give every man and woman in the service a complete picture of the wide range of school courses open to those who qualify under the prerequisites for selection also found in the catalog."

ARMY INSTITUTE OF PATHOLOGY

Dr. Frank G. Haughwout, formerly with the Bureau of Science, Manila, arrived at the Army Institute of Pathology on July 1 to serve as resident consultant for ninety days. He was for three years imprisoned in Japanese prison camps in the Philippines.

The resident consultants at the Army Institute of Pathology, Washington, D. C., during June were Drs. Hartwig Kuhlenbeck, Philadelphia; Henry Pinkerton, St. Louis; Herman Becks, San Francisco, and Granville Bennett, Chicago. Dr. Kuhlenbeck presented a special lecture at the institute June 16 on "Nephrogenic Adenoma of the Urinary Bladder."

JOINT EXHIBIT

The Surgeon General of the Army and Navy and the Air Surgeon of the Departments of the Army, Navy and Air Force jointly prepared the extensive exhibit for the annual meeting of the American Medical Association June 21 to 25, in Chicago, the theme of which was "The General Practitioner in the Atomic Age." This joint effort, the Army Medical Department states, is further proof of the complete armed forces unification.

NAVY

OFFICERS APPROVED FOR POSTGRADUATE TRAINING

At a recent meeting the Advisory Board of the Bureau of Medicine and Surgery approved the following officers for postgraduate training.

Captain Edward F. Kline: Training in Internal Medicine at Naval Hospital, Long Beach, Calif.

Captain Richard S. Silvis: Course in Surgery, University of Pennsylvania Graduate School of Medicine.

Commander John W. Albrittain: Residency in Dermatology and Syphilology, Naval Hospital, St. Albans, N. Y.

Commander Joseph L. Yon: Fellowship in Surgery at Northwestern University, Chicago (Cook County Hospital).

Lieut. Comdr. Eugene P. Cronkite: Course in Application of Nuclear Physics to the Biologic and Medical Sciences, Univ. of California, Los Angeles.

Lieut. Comdr. Charles H. Eaton: Training in Internal Medicine, U. S. Naval Hospital, Long Beach, Calif.

Lieut. Comdr. Leo S. Madlem Jr.: Residency in Psychiatry, Naval Hospital, Bethesda, Md.

Lieut. Henry G. Gardiner Jr.: Instruction in Psychiatry in a civilian institution to be designated.

Lieut. Chester M. Lessenden: Residency in Dermatology and Syphilology, Naval Hospital, St. Albans, N. Y.

Lieut. William E. Morris: Training in Urology, Naval Hospital, St. Albans, N. Y.

Lieut. Herbert G. Stoecklein: Course in Dermatology and Syphilology, Naval Hospital, San Diego, Calif.

Lieut. (jg) Walter T. Colbert: Course in Submarine Medicine.

Lieut. (jg) James R. Hamilton: Residency in Dermatology and Syphilology, Naval Hospital, San Diego, Calif.

Lieut. (jg) Verne K. Harvey Jr.: Instruction in Preventive Medicine, Univ. of California, Berkeley, Calif.

Lieut. (jg) Harold T. Meryman: Course in Application of Nuclear Physics to the Biologic and Medical Sciences, Univ. of Calif., Los Angeles.

Lieut. (jg) David R. Rogers: Course in Aviation Medicine, Naval Air Station, Pensacola, Fla.

Lieut. (jg) Robert E. Walsh: Residency in Anesthesia, Naval Hospital, St. Albans, N. Y.

TOUR OF INSPECTION IN AFRICA

Rear Admiral Lamont Pugh, deputy chief, Bureau of Medicine and Surgery, left June 23 with Capt. J. J. Sapero, M.C., to visit the Navy's Medical Research Unit in Africa which is now with the University of California's African Expedition in Nairobi, Kenya Province. Admiral Pugh will visit also the Navy's Research Unit at Cairo, the medical installation at Athens, Greece, the medical facilities of the Sixth Task Fleet and of the Naval Forces, East Atlantic and Mediterranean. Capt. Sapero will remain at Nairobi and will head the medical research unit until the completion of the expedition in about six months.

CAPTAIN RODDIS RETIRES

Capt. Louis H. Roddis retired on June 30 from active duty after thirty-four years of service. During the recent war he served as senior medical officer on the hospital ship *Relief* in the Central Pacific campaign. His latest assignment was editor of the *United States Naval Medical Bulletin*, to which position he had been assigned on two previous tours of duty. Capt. Roddis, retired, will continue on active duty at the Naval Hospital, San Diego, Calif., where he will direct the preparation of the Navy's Medical History of World War II.

NEW REGULAR OFFICERS

The following reserve medical officers have transferred to the Medical Corps of the Regular Navy: Lieuts. (jg) Donald E. Lloyd of Emporia, Kan.; Delmar W. Ruthig of Saginaw, Mich., and James H. Watts Jr., of Ansley, Neb.

AWARDS AND COMMENDATIONS

Robert D. Coghill

The President's Medal for Merit has been awarded to Robert D. Coghill, Ph.D., director of research at Abbott Laboratories, North Chicago, Ill. During the war Dr. Coghill was head of the Fermentation Division, Northern Regional Research Laboratory, U. S. Department of Agriculture, Peoria, Ill. The citation signed by the President states that he "planned and directed methods for seeking high yielding strains of penicillin molds and methods of recovery and purification of penicillin, which proved invaluable to the war effort."

RESERVE OFFICERS BEGIN INTERNSHIPS

The following newly appointed medical reserve officers, lieutenants (jg), have begun their internships in Naval Hospitals: Frank Fosdick Allen, Boston; Wilbur F. Amonette III, Radford, Va.; Leonard F. Bender, Upper Darby, Pa.; Robert A. Berger, Williamsport, Pa.; Ellsworth R. Browneller, Williamsport, Pa.; Thomas B. Delaney, Worcester, Mass.; James J. Humes, Overbrook Hills, Pa.; George B. Kimbrough, Louisville, Ky.; Norman A. Parrott, Paducah, Ky.; Paul Podmajersky, Chicago; Robert D. Rector, Mechanicsburg, Pa.; Daniel L. Shaw Jr., Philadelphia; Lawrence Stark, New York, and Robert B. Wright, Erie, Pa.

PERSONAL

Lieutenant (jg) Joseph J. Martorano of New York has recently accepted an appointment as Aviation Physiologist in the Medical Service Corps of the Regular Navy.

VETERANS ADMINISTRATION

MORE NEUROPSYCHIATRIC PATIENTS DISCHARGED THAN ADMITTED

Improved technics in the care of mentally ill veterans are enabling the Veterans Administration, for the first time in many years, to discharge about as many patients as are admitted to its neuropsychiatric hospitals. From July 1947 to April 1948, 1,060 more neuropsychiatric patients were discharged from hospitals than were admitted. However, for the twenty-two month period ending with April 1948, 107,579 patients were admitted for treatment and 106,694 discharged, only 885 more admissions than discharges. The establishment of more mental hygiene clinics for outpatient treatment is another factor for enabling the Veterans Administration to keep its hospital load of mentally ill from increasing substantially. The Veterans Administration neuropsychiatric service endeavors to treat actively mentally ill veterans before they become hospital patients and makes every effort to see that they are returned to their homes in restored or improved health. New policies permitting more effective treatment of mental patients and the improved or new technics used include:

1. Establishment of neuropsychiatric units in general medical hospitals to permit intensive early treatment of acutely psychotic and other psychiatric patients.
2. Establishment of general medical and surgical sections in neuropsychiatric hospitals, along with the organization of acute intensive treatment and continued treatment services for the acutely ill and long term patient.
3. Use of electric shock and insulin shock therapy.
4. Performance of prefrontal leukotomies on selected groups of patients.
5. Increased use of psychotherapy, both individual and group.
6. Extensive educational programs, residency training and affiliation with top medical schools in all the neuropsychiatric specialties.
7. Extension of mental hygiene clinics to treat eligible veterans before they become ill enough to be hospital patients.
8. Introduction of the "team technic" in the mental hygiene clinics. Each team—consisting of a psychiatrist, clinical psychologist and two psychiatric social workers—carries a full case load of patients, greatly speeding treatment and preventing many veterans from becoming patients in mental hospitals by early effective treatment of their illnesses.
9. Testing of the "team technic" in the rural areas in hope of bringing "traveling mental hygiene clinics" to veterans outside metropolitan areas.
10. Reorganization of the neurology service and establishment of neurologic diagnostic and treatment centers to which patients from areas lacking competent neurologic staffs can be referred.
11. Establishment of a clinical psychology program which has become a vital part of the diagnostic and treatment teams in hospitals and clinics. Through the interest of psychologists, neurologists and psychiatrists, many research studies into little known diseases and injuries have been undertaken.
12. Widespread use of volunteer workers in mental hospitals and development of a program of public education regarding mental illnesses.
13. Participation of the Veterans Administration's professional people in community and professional activities outside the hospitals.
14. Establishment of research programs into the causes of war neuroses, epilepsy, schizophrenia and other ailments. Group psychotherapy, shock therapy and other methods of cure also are subjects on the research programs.
15. Establishment of special laboratories for studies in pathology and psychosomatic disorders.
16. More extensive use of narcosynthesis and hypnosis.
17. Intensive medical rehabilitation for chronic patients, including those suffering from the diseases of old age. A current survey reveals that despite improved rates of discharges from hospitals, 74 per cent of all the patients presently in neuropsychiatric hospitals have been there for over a year and 55 per cent of the neuropsychiatric hospital population have been there over three years. Concerted efforts are being made to rehabilitate this group so that they may leave the hospital or be better able to care for themselves within the hospital. Plans to effect these goals include intensive application of physical medical rehabilitation procedures for all chronic patients including the aged, wide extension of trial visits both in the patient's own home or other suitable supervised home, and the establishment of hospital clinics to assist trial-visit patients in remaining out of the hospital.
18. Inauguration of a physical medicine rehabilitation program, including aural rehabilitation and speech correction, educational therapy, manual arts therapy, and physical therapy to assist in the physical and mental recovery of all veteran patients.

TUBERCULOSIS PATIENTS AND VETERANS' LIBRARIES

Patients in the Veterans Administration's eighteen tuberculosis hospitals read on the average, during April, one book, magazine or microfilmed publication every other day from hospital libraries. Veterans in the seventy-four general hospitals obtained reading material from the hospital libraries on an average of once in six days. Veterans in the thirty-four neuropsychiatric hospitals borrowed books and magazines once in every six and one-half days. Nearly 900,000 books and periodicals were on veterans hospital library shelves in April. Veterans' libraries are prepared to handle reference questions on a wide variety of subjects and during April answered nearly 12,000 queries from medical and patient personnel. The director of the veterans administration libraries service is F. R. St. John, formerly librarian in the Army Medical Library, Washington, D.C.

DECREASE OF VETERANS ON PENSION ROLLS

The Veterans Administration announces that the number of living veterans on disability compensation and pension rolls has decreased steadily over the past thirteen months. The total dropped from a peak of 2,328,000 on May 1, 1947, to 2,289,000 on June 1, 1948, a decrease of about 39,000.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

COLORADO

Course in Electroencephalography.—A twelve week graduate course in electroencephalography will be given three times annually starting the first Monday in September, December and March at the Colorado University Medical Center, Denver. It is open to graduates of medical schools approved by the Council on Medical Education and Hospitals who have had at least one year of training in physiology, neurology or psychiatry. The trainees will devote three months in the electroencephalography laboratory of the Colorado Psychopathic Hospital, Denver, and associated laboratories. The number of trainees who can be accommodated will be limited. Tuition is $125. Inquiries are to be directed to Dr. Ewald W. Busse, Director of Electroencephalography Department, Colorado University Medical Center, Denver.

ILLINOIS

Public Health Appointments.—Dr. Henrietta Herbolsheimer has been appointed medical administrative assistant to Dr. Roland R. Cross, director, Illinois Department of Public Health. A graduate of the University of Chicago School of Medicine, Dr. Herbolsheimer has been a member of the staff of the department for seven years. George K. Hendrix has been appointed chief of the Division of Hospital Construction and Services, succeeding Dr. Herbolsheimer. He holds the Bachelor of Science degree in civil engineering and has done graduate work in the field of public health engineering at the University of Michigan, Ann Arbor.

Chicago

Receives Borden Award.—Dr. Ben Fisher, Milwaukee, has been named the winner of University of Illinois Borden Undergraduate Award for 1948, a gift of $500, for research in "Clinical Observations on the Prothrombin Test." Dr. Fisher received his Doctor of Medicine degree from the University of Illinois in June.

Fellows in Allergy.—Drs. Jean Dausset and Claude Lapresle, both of Paris, France, have been awarded fellowships to take a twelve month graduate course in allergy which will be offered next autumn by the University of Illinois' Colleges of Medicine and Pharmacy. They will receive stipends from a fund established by an anonymous donor. Eight American physicians also will be selected for the course, which starts September 27. The 1948-1949 course will be the fourth to be offered by the University of Illinois Allergy Unit.

New Exhibit on Infantile Paralysis.—An exhibit, designed to impart basic knowledge of infantile paralysis and other virus diseases, was opened June 17 at the Museum of Science and Industry in Jackson Park. It was developed by the National Foundation for Infantile Paralysis and the Cook County Chapter to help fight the disease and through education allay public fear regarding it. The first panel shows the relation of nerve impulse to muscle action in normal and paralyzed persons. The second panel shows the various possibilities that medical science is exploring to control poliomyelitis. The third panel is a life-sized transparent man with a simplified nervous structure, showing the muscles affected when poliomyelitis attacks certain areas in the brain and spinal cord. The fourth panel portrays steps in the treatment of patients with poliomyelitis, including orthopedic surgery. What the National Foundation for Infantile Paralysis is doing to fight poliomyelitis—research, education and medical care—makes up the fifth panel.

MASSACHUSETTS

Dr. Castle Succeeds Dr. Minot at Memorial Laboratory.—Dr. William B. Castle, professor of medicine at the Harvard Medical School, Boston, has been named to succeed Dr. George R. Minot as director of the Thorndike Memorial Laboratory of the Boston City Hospital. Dr. Castle has been associated with Dr. Minot, a Nobel Prize winner in medicine and physiology in 1934, in the laboratory for more than twenty years. He has been associate director since 1932. Thorndike Memorial Laboratory, opened in 1923, was designed to provide adequate facilities for research and study to physicians engaged in the care of patients. It is closely integrated with the clinical services of Boston City Hospital and Harvard Medical School.

MICHIGAN

University Appointment.—Dr. Robert R. Morgan, Boston, has been appointed associate professor of epidemiology at the School of Public Health, University of Michigan. Dr. Morgan has recently been working as senior fellow in virus diseases, National Research Council, at the Thorndike Memorial Laboratory in Boston, with Dr. Maxwell Finland and John F. Enders, Ph.D. His investigations have been concerned with Salmonella and chemotherapy of virus infections.

Personal.—Mable M. MacLachlan, director of dietetics, University Hospital, University of Michigan, has resigned, effective June 30, to become educational director of the American Dietetics Association.——Dr. Edward P. Cawley, Ann Arbor, a graduate of the University of Michigan Medical School, 1940, has been appointed assistant professor of dermatology at his alma mater.

NEW JERSEY

Appoint Hospital Medical Director.—Dr. Royal A. Schaaf, Newark, member of the Presbyterian Hospital staff for twenty-nine years, has been named to succeed Dr. E. Zeh Hawkes, Newark, as medical director of the hospital. Dr. Schaaf is president of the Society of Surgeons of New Jersey and past president of the Medical Society of New Jersey. Dr. Hawkes has been medical director for the past twenty-one years. He expects to continue practice in surgery and gynecology.

Museum for Proteins of Organisms.—A museum for the collection and study of the proteins of the blood and other tissues of organisms has been established in the department of zoology at Rutgers University, New Brunswick. The museum is an outgrowth of studies in systematic serology conducted for twenty-three years by Dr. Alan Boyden, professor of zoology, and his students and colleagues. The museum will endeavor to preserve the representative serums and other proteins of organisms, to build up the collection to the point where each group of organisms is represented, to share specimens with other researchers and to learn as much as possible about the samples collected. While the serums of hundreds of species of animals have already been collected, no group of animals is yet adequately represented in the collection or has yet been adequately studied serologically. The museum invites the cooperation of all naturalists in a position to contribute or exchange samples of the proteins of organisms.

NEW YORK

Organize Academy of General Practitioners.—At an organization meeting in Syracuse June 3 the New York State Academy of General Practitioners elected Dr. William A. Buecheler, Syracuse, president; Dr. James H. Arseneau, Lyons, secretary, and Dr. Morton M. Spielman, New York, treasurer.

Pamphlet on BCG Vaccination.—The New York State Department of Health and the Medical Society of the State of New York have published a pamphlet to be distributed to groups directly concerned with BCG vaccination programs. The pamphlet gives the administrative aspects of the program, explains the technics of BCG vaccination and recommends procedures for tuberculin testing. Additional information is given under such headings as Consultation and Advisory Service, Contraindications to Vaccination, Reactions, Record Forms and Ordering of Vaccine.

Personal.—Dr. Dicran A. Berberian, formerly chairman, department of bacteriology and parasitology, American University of Beirut, Lebanon, is now a senior investigator in the department of chemotherapy of the Sterling-Winthrop Research Institute, Rensselaer, N. Y. Dr. Berberian is also assistant professor of medicine at Albany Medical College, where he lectures on tropical diseases.

New York City

Society News.—The Nassau Neuropsychiatric Society was recently organized by the private practicing neurologists and psychiatrists of Nassau County, Long Island and New York, with Dr. James L. McCartney, president, and Dr. Peter G. Denker, secretary-treasurer.

Four Assume Emeritus Status at Columbia.—Four members of the Columbia University College of Physicians and Surgeons faculty assumed emeritus status on July 1. They are: Dr. Louis Casamajor, professor emeritus of clinical neurology; Dr. William H. McCastline, university medical officer emeritus; Dr. Walter W. Palmer, Bard professor emeritus of medicine, and Dr. Edwin G. Zabriskie, professor emeritus of clinical neurology.

Achievement Award.—During the commencement program of the Long Island College of Medicine, June 10, the Alumni Medallion for achievement, an annual award given to the graduate who has made a significant contribution to American medicine, was presented to Dr. George Gray Ward of the class of 1891. Dr. Ward is a former professor of obstetrics and gynecology at New York Postgraduate Hospital, Cornell University Medical College, and Columbia University College of Physicians and Surgeons.

Symposium on Radioiodine.—The Biology Department of Brookhaven National Laboratory, Upton, L. I., announces a conference to be held at Brookhaven July 26-30 on the "Biological Applications of Nuclear Physics." The last three days will be devoted to a symposium on radioiodine, covering the following subjects: radioiodine as a tool in evaluating the functions and physiologic aspects of thyroid tumors, standardization of radioiodine, radioiodine in diagnosis and treatment of hyperthyroidism, histologic types of thyroid carcinoma and their respective abilities to store radioiodine, and clinical methods and results of radioiodine therapy in metastatic thyroid cancer.

Memorial Panel on Pneumatology.—The New York University College of Medicine and the Society for the Prevention of Asphyxial Death prepared a panel on pneumatology at the Ohio State University College of Medicine, Columbus, June 17, as a memorial to William Allen Turner from his daughter, Miss Cameron Turner, Macochee Castle, Ohio. The program included discussions of gases in the saving of life and in the control of pain. The classes are to be repeated the first Friday of each month at the Manhattan General and the New York Eye and Ear Infirmary under the auspices of the New York University College of Medicine, Postgraduate Division, and the Society for the Prevention of Asphyxial Death, Inc. All communications should be addessed to the society, 205 East 78th Street, New York.

Appointments to Research Staff. — The Public Health Research Institute of the City of New York, Inc., a nonprofit organization, engaged in research in problems of public health in New York, has announced the following staff appointments: Dr. DeWitt Stetten Jr., assistant professor in the department of biological chemistry at Harvard Medical School, Boston, has been appointed chief of the division of nutrition and physiology. He replaces Otto A. Bessey, Ph.D., New York, who resigned to become professor and head of the department of biological chemistry at the University of Illinois College of Medicine, Chicago, on April 1. Dr. Hubert Bloch, guest of the Rockefeller Institute for Medical Research from Basil, Switzerland, as associate member in the division of applied immunology. Marjorie R. Stetten, Ph.D., as associate in the division of nutrition and physiology. Dr. Richard E. Rosenfield, New York, as assistant in the division of applied immunology. Dr. Katherine Sprunt, Baltimore, as assistant in the division of infectious diseases. The following have resigned: Dr. Oliver H. Lowry, formerly member and associate chief of the division of nutrition and physiology, has joined the staff of Washington University School of Medicine, St. Louis, as professor of pharmacology. Dr. Robert E. Shank, New York, associate member in the division of nutrition and physiology, has accepted the position of professor of preventive medicine at Washington University School of Medicine.

NORTH CAROLINA

University Appointments.—Dr. Felda Hightower, affiliated with the North Carolina Baptist Hospital and Bowman Gray School of Medicine, Winston-Salem, since July 1941, has become assistant professor of surgery in charge of general surgery. Other appointments include: Dr. Ernest H. Yount Jr., Newton, instructor in internal medicine; Dr. John Carroll Wiggins, Winston-Salem, assistant in clinical medicine; and Dr. Leslie M. Morris, Rutherfordton, instructor in radiology.

OHIO

First Governor Was a Physician.—In the *Bulletin of the History of Medicine* Linden F. Edwards writes that Dr. Edward Tiffin arrived at Chillicothe in 1798 after a hazardous journey from Virginia and immediately began the practice of medicine. George Washington had written previously to the Governor of the Northwest Territory paying tribute to Dr. Tiffin's character and recommending him for official appointment. The governor appointed Dr. Tiffin clerk of the common pleas court of Ross County in 1798, and from then for nearly thirty-one years Dr. Tiffin held public office. He was elected the first governor of Ohio in 1803, and before his second term expired, was elected to the United States Senate. He resigned as senator in 1809 and returned to Chillicothe hoping to retire from public office. However, the following year he was elected to the Ohio General Assembly, and was reelected in 1810. President Madison appointed Dr. Tiffin to be commissioner of what is now the Department of the Interior. He returned to Washington in 1814 as surveyor-general of the Northwest, holding that office during the terms of Madison, Monroe and John Quincy Adams. Dr. Tiffin died in 1820 at the age of 64. He continued to practice medicine almost until the time of his death.

TENNESSEE

University Appointment.—Dr. James N. Etteldorf, Memphis, has been appointed associate professor of pediatrics and will be director of the new pediatric research and diagnostic laboratory in John Gaston Hospital, of the University of Tennessee College of Medicine, Memphis.

Personal.—Dr. James G. Shaffer, assistant professor of preventive medicine and public health at Vanderbilt University School of Medicine, Nashville, has resigned, effective July 1, to become associate professor of bacteriology and virology and associate in preventive medicine at the University of Louisville School of Medicine, Louisville, Ky.

Unveil Portrait of Dr. Ellett.—A portrait of the late Dr. Edward C. Ellett, Memphis, was unveiled June 8 in the Memphis Eye, Ear, Nose and Throat Hospital, where he served as chief of staff from 1926 until his death a year ago. The Memphis Society of Ophthalmology and Otolaryngology commissioned the portrait, and former associates and colleagues and former residents of the hospital contributed to the fund.

TEXAS

University Appointment.—Dr. Benjamin B. Wells, formerly dean of the University of Arkansas School of Medicine, Little Rock, has been appointed director and head of the department of clinical pathology at the University of Texas Medical Branch, Galveston. Dr. Wells was graduated from Baylor University College of Medicine, Houston, in 1935.

Dallas Health Museum Award.—Robert L. Sutherland, Ph.D., Austin, director, Hogg Foundation, University of Texas, Austin, received the first annual Dallas Health Museum Award at the meeting of the state medical association in Houston. Nominations were made to the Health Museum by Texas health agencies and organizations. Dr. Sutherland was cited "For his skill and activity in stimulating local responsibility in mental health education and for his profound interest in people."

Texas Cancer Bulletin.—The first number of the *Texas Cancer Bulletin* was published late in February by the Texas Cancer Coordinating Council, which is made up of the executive heads of the Committee on Cancer of the State Medical Association of Texas, Texas State Board of Health, the University of Texas M. D. Anderson Hospital for Cancer Research, Houston, and the American Cancer Society, Texas Division. The bulletin, prepared six times a year, is distributed free of charge to Texas physicians. Part of the funds for this project have been donated by the American Cancer Society and the state department of health. The M. D. Anderson Hospital is contributing the services of its entire staff. The state medical association is contributing both funds and services. The bulletin, designed for the family doctor, publishes the results of important researches. Two special issues, one for dentists and one for nurses, are scheduled for publication this year. The editorial staff includes Russell W. Cumley, Ph.D., executive editor, and Dr. R. Lee Clark Jr., Houston, directing medical editor.

WISCONSIN

Personal.—Dr. Henry A. Anderson, Medical Director, River Pines Sanatorium, Stevens Point, has been named president of the Wisconsin Trudeau Society, which he has also served as vice-president. Dr. David D. Feld, Wauwatosa, is secretary-treasurer.

Narcotic Violation.—The Federal Bureau of Narcotics reports that Dr. Loraine Karl Everson, Madison, pleaded guilty in the United States District Court to violation of the federal narcotic law and on May 10 was sentenced to a term of six months to be followed by probation for a period of two years.

Agency for the Chronically Ill.—The Central Agency for Chronically Ill, which has established headquarters at 756 North Milwaukee Street, Milwaukee, will list all resources for the care of the chronically ill in Milwaukee; refer requests for services to them; foster coordination of services for the chronically ill, and aid in the development of programs indicated for their care. The Service Club of Milwaukee has given $19,000 toward the development of the agency's program.

GENERAL

New Volumes on Medical Research.—*Methods in Medical Research,* a new series of annual volumes, is announced by the members of the governing board of this publication: Drs. Irvine H. Page, Indianapolis; Andrew C. Ivy, Chicago; Colin M. MacLeod, New York; Carl F. Schmidt, Philadelphia; Eugene A. Stead Sr., Durham, N.C., and David L. Thompson, Detroit. The first volume will be available in August 1948. The new series will be published by Year Book Publishers, Inc., Chicago.

Nutrition Research.—The Nutrition Foundation, Inc., has authorized grants totaling $121,917 to fifteen universities and medical centers in the United States and Canada. Projects deal with vitamins, amino acids, sugars, fats and trace elements. Donations to the foundation of $10,000 each from the Great Atlantic & Pacific Tea Company, New York, and the Purity Bakeries Corporation, Chicago, and of $1,000 from the Southern Cotton Oil Company, New Orleans, have been announced.

Prize for Contribution on Paget's Disease.—The Louis Lefkoe Memorial Foundation, Philadelphia, is offering a prize of $250 for the best original contribution to the medical knowledge of osteitis deformans (Paget's Disease). The paper may cover any aspect of the subject such as pathogenesis, biochemical knowledge, pathology or treatment. The paper is to be submitted to the trustees of the foundation on or before April 5, 1949, the birthday of Louis Lefkoe, in whose memory the foundation was created a year ago.

Books for Refugee Physicians.—The Preparatory Commission for the International Refugee Organization, Washington, D. C., is appealing for a donation of textbooks and journals to be distributed to refugee doctors and dentists. Among the 600,000 displaced persons in Germany, Austria, the Middle East and Italy, there are 2,500 doctors, dentists and pharmacists. One problem of this group is obtaining information on the progress in medicine during the past ten years. Donations should be addressed to the commission, Room 330, 1344 Connecticut Avenue N.W., Washington 25, D. C.

Increase in Life Span.—The persons who died in the United States in 1946 were six years older, on the average, than those who died in 1933, according to figures of the National Office of Vital Statistics. The average (median) age at death was 58.2 years in 1933 and 64.2 years in 1946. On the average, women live longer than men and their average age at death has increased faster. The average age at death for women was 59.2 in 1933 and 66.2 in 1946, an increase of 7.1 years, or 12 per cent. For men the average age at death in 1946 was 62.7 years. This was 5.2 years, or 9 per cent, higher than the corresponding age of 57.5 in 1933. The death rates decreased for every age group in the population between 1933 and 1946. The greatest improvement occurred among children 1 to 4 years of age. The death rate for this group dropped from 4.7 in 1933 to 1.8 in 1946, or 62 per cent. The smallest relative drop in death rates, 10 per cent, is seen for persons 75 years of age and over.

Survey of Tuberculosis Mortality.—A five year summary of tuberculosis mortality was released April 5 by Dr. Herbert R. Edwards of the New York Tuberculosis and Health Association. The tuberculosis death rate for the entire United States was reported as 36.4 per hundred thousand population The fifteen largest cities showed the following 1946 "recorded" death rates: New Orleans 85; Washington, D. C., 62.3; Boston 60.2; Los Angeles 54.2; Buffalo 54; Philadelphia 53.3; Baltimore 50.6 Cleveland 50.4; Pittsburgh 49.4; San Francisco 48.5 Chicago 43.4; Detroit 42.85 New York 41.7; Milwaukee 34.7 and St. Louis 31.4. In foreign countries studied, Lisbon, Portugal, led European cities with a rate of 367, and Bulgaria led European countries with a rate of 161. In 1946 Canada's death rate was 47.3, England and Wales 53.3, Scotland 78.8, Northern Ireland 83.3 and the Irish Free State 114.4. On the European continent a low rate of 32 is reported in Denmark, 47 in the Netherlands, 68 in Spain, 81 in France, 120 in Hungary, 149 in Finland and 161 in Bulgaria. Large European cities in general had high rates: Copenhagen 44, Amsterdam 51, Stockholm 56, Oslo 61, London 70, Edinburgh 76, Paris 78, Belfast 94, Madrid 110, Glasgow 132, Budapest 143, Dublin 152, Rome 159, Vienna 164 and Berlin 260. In Warsaw a rate of 500 was said to prevail in 1944 as against 155 before the war.

Appointments to Strengthen Faculties.—The first group of scholars in medical science, under the plan announced by the John and Mary R. Markle Foundation to support qualified young scientists who plan to make a career in academic medicine, has been appointed. They were selected from candidates nominated by medical schools in the United States and Canada and regional committees appointed by the foundation. Toward the support of the scholars and their research the foundation has allocated $400,000 to their respective medical schools, each school to receive $25,000 payable at the rate of $5,000 annually for five years. As faculty members of these schools, the scholars will devote the next five years to teaching and research, at the end of which time they will have had an opportunity to become established teachers and investigators Scholars will be appointed each year for the next few years for the long range purpose of strengthening medical education.

The sixteen scholars whose appointments begin in 1948 and their fields of research are: Christian B. Anfinsen, Ph.D., biochemistry at Harvard Medical School, Boston; Dr. Henry H. Balch, surgical infections at New York University College of Medicine, New York; Dr. Edward J. Beattie Jr., surgery and cardiorespiratory physiology at the George Washington University School of Medicine, Washington, D. C.; Dr. Marcel E. Blanchaer, biochemistry at the University of Manitoba, Winnipeg, Canada; Dr. Iven W. Brown Jr., injury produced by transfusion at Duke University School of Medicine. Durham, N. C.; Dr. Robert H. Ebert, pulmonary diseases at the University of Chicago. Dr. Richard C. Fowler, physiology and development of physicochemical tools at the University of Rochester School of Medicine and Denistry, Rochester, N.Y., Dr. Henry D. Hoberman, biochemistry and metabolism of compounds by use of isotope tracers at Yale University School of Medicine, New Haven, Conn.; Dr. Ralph A. Kinsella Jr., biologic chemistry at St. Louis University School of Medicine, St. Louis; Dr. Christian J. Lambertsen, pharmacology and cardiovascular and respiratory problems at the University of Pennsylvania School of Medicine, Philadelphia; Dr. William D. Lotspeich, renal physiology at Syracuse University College of Medicine, Syracuse, N. Y.; Dr. Preston B. Lowrance, cardiovascular disease at the University of Virginia Department of Medicine, Charlottesville, Va.; Dr. Frederick D. McCandless, neuropsychiatry at Albany Medical College, Albany, N. Y.; Dr. Manson Meads, internal medicine and infectious diseases at the Bowman Gray School of Medicine, Winston-Salem, N. C.; Dr. Julius B. Richmond, pediatrics at the University of Illinois College of Medicine, Chicago; Dr. Ralph O. Smith, internal medicine at Washington University School of Medicine, St. Louis.

Deaths

Oscar Reiss ⊕ Beverly Hills, Calif., chairman of the Section on Pediatrics of the American Medical Association, 1947-1948 and vice chairman in 1941 and 1942, died June 16, aged 65, of coronary thrombosis. Dr. Reiss was born in Jassy, Rumania, March 24, 1883. He attended the University of Michigan and graduated from the College of Physicians and Surgeons of Chicago in 1906. He practiced in Chicago for a while, then moved to Nevada, then to California. In 1918 he returned to Chicago to receive pediatric training at the Sara Morris Memorial, Michael Reese Hospital. From 1919 to 1923 he was the first chief of the child welfare division of the Los Angeles Health Department, which he had organized. In addition to being a charter member and first president of the Trudeau Society of Los Angeles and the Southwestern Pediatric Society, which he also served as secretary, Dr. Reiss was a founder and three times president of the Southern California Mental Hygiene Society. He served as a consultant and member of the National Advisory Committee of the Childrens Bureau, participated in the first White House Conference on Maternal and Child Health and was invited by President Truman in 1948 to participate in planning a Health Program for the nation. Dr. Reiss was a specialist certified by the American Board of Pediatrics, a fellow of the American Academy of Pediatrics, a member of the American Orthopsychiatric Association, councillor of the Los Angeles County Medical Society and secretary-treasurer of its medical milk commission. He was clinical professor of pediatrics at the University of Southern California School of Medicine in Los Angeles and formerly associate professor of pediatrics at the College of Medical Evangelists in Loma Linda and Los Angeles, a member of the staff of St. Anne's Maternity Hospital, chief medical officer for thirty years of Vista Del Mar, the Los Angeles Jewish Orphans' Home, director of the pediatric service, and chief of staff of the Cedars of Lebanon Hospital, and chief of the pediatrics department of Los Angeles General Hospital for twenty years. He was the co-author of "My Body and How It Works." Dr. Reiss was to have represented the pediatric section of the American Medical Association, the American Academy of Pediatrics and the Southern California Society for Mental Hygiene at the International Conference on Mental Health to be held in London in August.

Oscar Reiss, M.D., 1883-1948

Philip Earle Blackerby ⊕ Kentucky State Health Commissioner, was found dead at his home in Louisville, Ky., June 24, aged 66, of cerebral hemorrhage. Dr. Blackerby was born in Berlin, Ky., July 8, 1881. After graduation from the University of Louisville Medical Department in 1904, he served one year at the New York Postgraduate Medical School and Hospital. From 1906 to 1914 he practiced medicine at Erlanger, Ky., then joined the state board of health, serving until 1917 as field medical officer in a program for the eradication of hookworm disease. From 1917 to 1921 he was director of the bureau of vital statistics and from 1921 to 1943 director of county health work. He was assistant state health commissioner and assistant secretary of the state board of health from 1925 to 1943. Since August 1943, when he was appointed to complete the unexpired term of the late Dr. Arthur T. McCormack, he has served as state health commissioner and secretary of the state board of health, serving also as dean of its school of laboratory technicians. Dr. Blackerby was secretary of the Kentucky State Medical Association, member of the American Public Health Association and its Southern Branch, Conference of State and Provincial Health Authorities of North America, State and Territorial Health Officers Association and the Southern Medical Association. During World War I he served as a captain in the medical reserve corps, in charge of Kentucky recruitment and assignment of physicians to the armed services, and during World War II he was chairman for the procurement and assignment in Kentucky. He was a member of the medical advisory committee to state welfare institutions and an ex officio member of the board of trustees of the Frontier Nursing Service. Dr. Blackerby had been editor of the *Kentucky State Medical Journal.*

Augustus Smith Knight ⊕ Far Hills, N. J.; born in Manchester, Mass., Nov. 24, 1864; Harvard Medical School, Boston, 1891; member of the American Psychiatric Association and the National Committee for Mental Hygiene; fellow of the American College of Surgeons; retired in 1934 as medical director of the Metropolitan Life Insurance Company in New York; treasurer of the Association of Life Insurance Medical Directors from 1903 to 1918 and in 1920 and 1921 president; president of the board of managers of the Greystone Park (N. J.) State Hospital; chairman of the board of trustees of the Somerset Hospital in Somerville, where he died March 21, aged 83, of injuries received in an automobile accident.

I. Newton Agenbroad, Dayton, Ohio; Eclectic Medical Institute, Cincinnati, 1891; died in the Miami Valley Hospital April 1, aged 84, of coronary thrombosis and myocardial disease.

Matilda Beaver ⊕ Philadelphia; Woman's Medical College of Pennsylvania, Philadelphia, 1899; died in the Woman's Hospital, February 2, aged 84, of pulmonary embolus.

Frank Leroy Carson, Shawnee, Okla,; born in Wakeeney, Kan., Feb. 11, 1882; Medical Department of Tulane University of Louisiana, New Orleans, 1906; also a graduate in pharmacy; fellow of the American College of Surgeons; member of the founders' group of the American Board of Surgery; past president of the Pottawatomie County Medical Society; surgeon at the A. C. H. Hospital; on the courtesy staffs of Shawnee Municipal Hospital and Shawnee Indian Sanatorium; died recently, aged 65, of rupture of the pulmonary artery.

William Wyche Dickey, Chattanooga, Tenn.; University of Tennessee College of Medicine, Memphis, 1915; served during World War I; died March 15, aged 68.

Andre L. Ducharme, Lewiston, Me.; University of Montreal Faculty of Medicine, Montreal, Que., Canada, 1921; died in Auburn March 26, aged 54.

Leander Jacob Eads, Hamilton, Mo.; University of Louisville (Ky.) Medical Department, 1889; died March 18, aged 83, of coronary occlusion.

Arthur Henry Ellis ⊕ Greenfield, Mass.; Dartmouth Medical School, Hanover, N. H., 1907; past president of the Franklin District Medical Society; member of the staffs of Franklin County Public Hospital in Greenfield and Farren Memorial Hospital, Montague City; died March 14, aged 66, of arteriosclerosis.

Jacob Julius Epstein ⊕ New York; Yale University School of Medicine, New Haven, 1910; served on the staffs of Beth Israel, Babies' and Gouverneur hospitals; died in the New York Hospital March 24, aged 67, of heart disease.

Edward Carlin Ferguson ⊕ Edwardsville, Ill.; Jefferson Medical College of Philadelphia, 1896; past president of the Madison County Medical Society; affiliated with St. Elizabeth's Hospital in Granite City and St. Joseph's Hospital in Alton; died March 26, aged 75, of coronary thrombosis.

Thomas S. Falvey, Conroe, Texas; University of the South Medical Department, Sewanee, Tenn., 1901; member of the American Medical Association; health officer of Montgomery County and city health officer of Conroe; served as local surgeon for the Santa Fe Railway; died March 15, aged 73, of arteriosclerosis.

Franklin Parkinson Flagg, Maynard, Mass.; Harvard Medical School, Boston, 1892; died in Brighton March 25, aged 82, of cerebral hemorrhage.

Clayton C. Flatt, Kinzua, Pa.; Western Pennsylvania Medical College, Pittsburgh, 1891; member of the American Medical Association; died in the Warren (Pa.) General Hospital March 28, aged 84, of pneumonia.

Charles Ross Fishel, Tacoma, Wash.; Ohio Medical University, Columbus, 1906; member of the American Medical Association and of the Radiological Society of North America, Inc.; served during World War I; died March 15, aged 69.

James Quitman Fountain, Memphis, Tenn.; Medical Department of Tulane University of Louisiana, New Orleans, 1893; for four years state senator from Hancock County, Miss., where he was for many years county health officer; an officer during World War I; served on the staffs of Charity Hospital in Natchez, Miss. and King's Daughters' Hospital in Gulfport, Miss.; died in Kennedy General Hospital March 28, aged 80, of cardiac failure.

Ada Mabel French, Los Angeles; Keokuk (Ia.) Medical College, College of Physicians and Surgeons, 1900; died February 19, aged 77, of cerebral hemorrhage and hypertension.

Victor C. Goldberg ⊕ Long Beach, Calif.; Columbia University College of Physicians and Surgeons, New York, 1910; died March 17, aged 61.

Jacob S. Gregg, Fort Smith, Ark.; Eclectic Medical College, Cincinnati, 1912; died March 16, aged 63.

Alpheus B. Green, Norfolk, Va.; Leonard Medical School, Raleigh, 1902; died February 5.

Martin Milton Hage, Lake Mills, Iowa; the Hahnemann Medical College and Hospital, Chicago, 1912; member of the American Medical Association; *on* the honorary staffs of Naeve Hospital, Albert Lea, Minn., Forest City (Iowa) Municipal Hospital and Mercy Hospital in Mason City, where he died March 9, aged 62, of cerebral hemorrhage.

Joseph Ridgway Haines, Mount Holly, N. J.; *Jefferson* Medical College of Philadelphia, 1897; also a graduate in pharmacy; served on the staff of Wills Eye Hospital in Philadelphia; died in the State Hospital, Trenton, March 6, aged 81, of bronchopneumonia.

Eward H. Hake, Youngstown, Ohio; Dunham Medical College, Chicago, 1902; member of the American Medical Association; on the courtesy staff of St. Elizabeth Hospital, where he died March 24, aged 74, of coronary thrombosis and diabetes mellitus.

Enoch N. Heston, Columbus, Ohio; Columbus Medical College, 1892; died in the Grant Hospital March 27, aged 78.

Joseph Carl Kahan, *Philadelphia*; Maryland Medical College, Baltimore, 1911; died February 11, aged 79, of coronary thrombosis.

Lawrence Larry Keller ⊕ Dallas, Texas; University of Tennessee College of Medicine, Memphis, 1913; served during World War I; died March 2, aged 61, of general peritonitis following a ruptured gallbladder.

Walter Dennis Kendig ⊕ Kenbridge, Va.; Medical College of Virginia, Richmond, 1905; past president of the Fourth District Medical Society and formerly vice president of the Medical Society of Virginia; member of the board of visitors of the Medical College of Virginia; state senator; affiliated with the Kendig Brothers Hospital in Victoria from 1920 to 1932; died *March 16, aged 67, of heart disease.*

Raymond Arndt Kiefer, Ramsey, N. J.; Jefferson Medical College of Philadelphia, 1903; a medical officer serving during World War I; served on the staffs of the Paterson (N. J.) Hospital and the Good Samaritan Hospital in Suffern, N. Y.; died in Tallman, N. Y., March 29, aged 71, of carcinoma of the bladder.

Jesse Alexander King, Ojai, Calif.; St. Louis College of Physicians and Surgeons, 1905; member of the American Medical Association; died March 31, aged 74.

William A. Kingsley, Brookline, Mass.; Laval University Faculty of Medicine, Quebec, Canada, 1908; died February 9, aged 70, of congestive heart failure.

Joseph Hunter Kirkpatrick ⊕ Los Angeles; Chicago Homeopathic Medical College, 1897; an Affiliate Fellow of the American Medical Association; served on the staff of California Hospital; died March 14, aged 76, of heart disease.

Harry Willard Kline, Anoka, Minn.; the Hahnemann Medical College and Hospital, Chicago, 1919; died March 17, aged 54, of coronary thrombosis and diabetes mellitus.

Marceine Denver Klote, Detroit; St. Louis University School of Medicine, 1928; member of the American Medical Association; affiliated with the Providence Hospital; died March 24, aged 45, of coronary thrombosis.

Samuel Tilden Ladd ⊕ *Portsmouth, N. H.; Dartmouth* Medical School, Hanover, N. H., 1900; past president of the New Hampshire Medical Society; formerly mayor of Portsmouth and comptroller of customs for the New England district; served in the city council and as city physician; died in the New England Deaconess Hospital in Boston, March 27, aged 71, of ruptured aneurysm of the right iliac artery.

Frank Henry Landes, Mount Ayr, Iowa; Marion-Sims College of Medicine, St. Louis, 1897; died March 13, aged 75, of heart disease.

Leslie Phillips Leland ⊕ Worcester, Mass.; Boston University School of Medicine, 1909; member of the New England Obstetrical and Gynecological Society; formerly secretary of the Worcester District Medical Society; member of the medical milk commission; on the staff of the Worcester Hahnemann Hospital, where he died March 16, aged 63, of lymphoblastoma.

John Newton Lightsey, Cotulla, Texas; University of Texas School of Medicine, Galveston, 1911; *member of the* American Medical Association; past president of the La Salle-Frio-Dimmit Counties Medical Society; county health officer; served during World War I; local surgeon for the Missouri Pacific Railroad; died March 17, aged 65, of heart disease.

Andrew Jackson Love, New York; Columbia University College of Physicians and Surgeons, New York, 1910; died March 21, aged 86, of coronary sclerosis.

John Henry Martin ⊕ Red Oak, N. C.; University of Nashville (Tenn.) Medical Department, 1903; died March 19, aged 80, of arteriosclerotic heart disease.

William Martin, Haddonfield, N. J.; Jefferson Medical College of Philadelphia, 1889; past president of the Bucks County (Pa.) Medical Society; served on the Ventnor Board of Education; affiliated with the Frankford and Friends hospitals in Philadelphia; died March 20, aged 79, of cerebral thrombosis.

George August May, Ann Arbor, Mich.; Yale University School of Medicine, New Haven, 1901; served as associate professor of physical education at the University of Michigan; died in the University Hospital March 28, aged 75.

George K. Maynard, Clovis, N. M.; St. Louis University School of Medicine, 1903; member of the American Medical Association; died in Brownsville, Texas, in March, aged 74.

John Patrick Murphy ⊕ St. Louis; St. Louis University School of Medicine, 1924; member of the Clinical Orthopaedic Society and of the American Academy of Orthopaedic Surgeons; on the staff of St. Mary's Hospital; died March 21, aged 61, of heart disease.

Paul Oliver, Frankfort, Mich.; Rush Medical College, Chicago, 1901; fellow of the American College of Surgeons; formerly on the faculty of his alma mater; served during World War I; *formerly on the staff of the West Suburban Hospital* in Oak Park, Ill.; died in Daytona Beach, Fla., March 20, aged 72, of coronary occlusion.

William Henry Orwick, Massillon, Ohio; Western Reserve *University School of Medicine, Cleveland, 1946; interned* at the Youngstown (Ohio) Hospital; lieutenant in the medical corps, Army of the United States, assigned to Fort Adams, Newport, R. I.; died in Walter Reed General Hospital, Washington, D. C., February 20, aged 26, following the removal of a benign cyst from the fourth ventricle.

Leonard Joseph Ostrowski ⊕ East Chicago, Ind.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1912; also a graduate in pharmacy; on the staff of St. Catherine's Hospital; died while vacationing in Mesa, Ariz., March 28, aged 62.

Elmer Ellsworth Overfield, Eaton Rapids, Mich.; State University of Iowa College of Medicine, Iowa City, 1888; died March 25, aged 86, of chronic myocarditis.

Anders Peter Overgaard ⊕ Houston, Texas; Omaha Medical College, 1900; specialist certified by the American Board of Radiology, Inc.; member of the American Roentgen Ray Society, Radiological Society of North America, Inc., and the American College of Radiology; served on the staff of Covenant Hospital in Omaha and the Houston Clinic; died March 14, aged 69, of carcinoma of the bladder.

Samuel Benjamin Peacock ⊕ Pittsfield, Ill.; Keokuk (Ia.) Medical College, 1896; died March 6, aged 81, of heart disease.

Julius Frederick Peppler, Rockford, Mich.; Rush Medical College, Chicago, 1902; for several terms village president; during World War I served in the medical corps of the U. S. Army; on the staff of St. Mary's Hospital in Grand Rapids; died in Veterans Administration Hospital in Grand Rapids March 10, aged 75, of leukemia.

William Anthony Peters ⊕ Elizabeth City, N. C.; Medical College of Virginia, Richmond, 1915; affiliated with Albermarle Hospital; surgeon for the Norfolk and Southern Railroad; drowned while fishing March 17, aged 57.

Meade Hubbard Phelps, Natchitoches, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1912; parish coroner for many years; on the staff of the Natchitoches Hospital; died March 12, aged 62, of coronary occlusion.

De Costa Rhines, Owatonna, Minn.; the Hahnemann Medical College and Hospital, Chicago, 1884; served for many years as county coroner, a term as president of the village council and on the school board; died February 9, aged 89.

Fred J. Roemer, Port Lavaca, Texas; Memphis (Tenn.) Hospital Medical College, 1904; examining physician for Selective Service during World Wars I and II; county health officer; local surgeon for the Missouri Pacific and Southern Pacific railroads; died February 21, aged 69, of heart disease.

John Francis Russell, Troy, N. Y.; Georgetown University School of Medicine, Washington, D. C., 1929; served during World War II; died March 23, aged 44, after an operation for bleeding duodenal ulcer.

Benjamin Clarence Rush, Vaughan, Miss.; Tulane University of Louisiana School of Medicine, New Orleans, 1916; member of the American Medical Association; served during World War I; died March 29, aged 47, of heart disease.

William W. Shafer, Haines City, Fla.; Marion-Sims College of Medicine, St. Louis, 1892; Barnes Medical College, St. Louis, 1893; member of the American Medical Association; past president of the Polk County Medical Society; affiliated with the Morrell Memorial Hospital, Lakeland, where he died January 6, aged 82, of cerebral vascular disease and bronchopneumonia.

Lewis Maurice Shear ⊕ Lancaster, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1910; served on the board of education, formerly city treasurer, director of public safety and city commissioner; affiliated with Lancaster General and St. Joseph's hospitals; died recently, aged 62, of coronary occlusion.

H. Lee Simpson, Detroit; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1904; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology and the American Medical Association; fellow of the American College of Surgeons; on the staffs of Harper Hospital, Receiving Hospital and Jennings Hospital, where he died February 3, aged 69, of coronary occlusion.

Claude Maurice Stafford, Detroit; Detroit College of Medicine, 1906; fellow of the American College of Surgeons; served as acting assistant surgeon in the U. S. Public Health Service; U. S. Consulate at Windsor, Ontario, Canada; formerly on the staff of St. Joseph's Mercy Hospital and for many years on the staff of St. Mary's Hospital; died in Riverside, Ontario, March 10, aged 66, of carcinoma of the rectum.

Michael Aloysius Sullivan ⊕ Lackawanna, N. Y.; Niagara University Medical Department, Buffalo, 1899; fellow of the American College of Surgeons; chief of staff of Our Lady of Victory Hospital and senior consultant at the Mount Mercy Hospital in Buffalo; died March 11, aged 71, of coronary thrombosis.

Clarkson B. Thomas ⊕ Plainfield, Ind.; Physio-Medical College of Indiana, Indianapolis, 1902; past president of the Hendricks County Medical Society and of the Seventh District Medical Society; formerly on the faculty of his alma mater; affiliated with Methodist Hospital, Indianapolis; died March 13, aged 71, of coronary occlusion.

William Vernon Tucker, Elkhart, Kan.; Louisville (Ky.) Medical College, 1893; died in Phoenix, Ariz., recently, aged 80, of heart disease and peptic ulcer.

James Lindley Vail, Cranford, N. J.; University of Pennsylvania Department of Medicine, Philadelphia, 1898; served as physician for the board of education and board of health; died in the Convalescent Home, Roselle Park, March 22, aged 75, of coronary thrombosis.

Henry Edward Whalen ⊕ Dexter, Maine; Jefferson Medical College of Philadelphia, 1922; affiliated with Plummer Memorial Hospital; died in Massachusetts Memorial Hospital, Boston, March 3, aged 50, of hypertensive heart disease.

Phillip Henry White, Cleveland; Illinois Medical College, Chicago, 1904; died in Selma, Ala., February 6, aged 71.

KILLED IN ACTION

Capt. Webster C. Smyers, M.C., A.U.S., 1914-1944

Lieut. Hiram M. Greene (MC) U. S. Navy, 1915-1946

Lieut. Col. Willis H. Drummond M.C., A.U.S., 1899-1944

Webster Cullen Smyers, Dayton, Ohio; University of Cincinnati College of Medicine, 1941; interned at the Miami Valley Hospital; began active duty as a first lieutenant in the medical corps, Army of the United States, in June 1941; promoted to captain; killed in action in the South China Sea Oct. 24, 1944, aged 30, as the result of the sinking of a Japanese ship on which he was being transported while a prisoner of war.

Hiram Moe Greene ⊕ Lieutenant, (MC), U. S. Navy, Fremont, Ohio; University of Louisville (Ky.) School of Medicine, 1941; appointed a lieutenant (jg) in the medical corps of the U. S. Navy on Jan. 6, 1941; interned at the U. S. Naval Hospital in Chelsea, Mass.; officially reported to be missing in action as of Nov. 1, 1943, serving aboard the U. S. S. *Wahoo* when that submarine failed to return from a war patrol in the Sea of Japan; presumptive date of death by the Navy Department is given as Jan. 7, 1946, aged 31.

Correction.—Above is the correct photograph of Willis Hinton Drummond ⊕ Lieutenant Colonel, MC., U. S. Army, Hollywood, Calif., who was killed in action in the Pacific area Dec. 15, 1944. Dr. Drummond's obituary appeared in The Journal, June 26, page 804, under the picture of Major Michael A. Rafferty, M.C., A.U.S., who was killed in action in Belgium, Nov. 24, 1944. Dr. Raffery's obituary appeared in The Journal, Feb. 10, 1945, page 352.

The 1947 Epidemic of Poliomyelitis

The Ministry of Health has published an analysis of the 1947 epidemic of poliomyelitis. The corrected notifications during 1947 are likely to amount to between 7,000 and 7,500. This gives an attack of 18 per hundred thousand population, compared to 3.8 in 1938, previously the year of highest recorded incidence. In 1938 the death rate from the disease was 6 per million living and the case fatality rate was 16 per cent. For 1947 the corresponding figures were 18 and 10, respectively. Thus, although there were many more deaths in 1947, the fatality rate was lower than in 1938. Details are also given of the special hospital inquiry to ascertain the probable results of the epidemic. Hospitals have made returns up to Oct. 11, 1947, of 6.762 patients admitted, for 4.717 of whom the diagnosis was confirmed. About one third of the patients were under the age of 5 years, one third between 5 and 15 and one third over 15. Only 14 per cent of the deaths occurred in children under 5 years of age, one fifth in children between 5 and 15 and no less than two thirds in persons over 15. The term infantile paralysis should be abandoned because the disease heavily attacks adults, in whom it carries a greater risk of death than in young children.

The Extent of Recovery

It is probably too early yet to estimate the full extent of the recovery of paralyzed muscles. Only one fifth of the paralyzed patients are at present classified as "severe," that is, "unlikely to return to normal life." Against this nearly a quarter of all the patients attacked by the disease had no paralysis at all. It is estimated that some 3,000 of the patients will need extended hospital treatment. Respirators ("iron lungs") were used for over 300 patients.

Liver Preparations in Pernicious Anemia

In a discussion at the section of medicine of the Royal Society of Medicine on the megalocytic anemias Dr. J. F. Wilkinson said that the liver principle necessary for production of normal red blood cells is absent in pernicious anemia, and a similar, if not the same, principle is obtainable from animal livers. During the last twenty years it has been found widely distributed in the livers of many species of animals. But whale liver and cod liver oil residues, after the oil has been extracted, are inactive. The same holds for fish livers in general, and he has yet to obtain an active liver extract from reptiles. An important observation was that the livers of cattle who died of diseases such as nakuruitis did not contain the active principle. For some time it has been a matter of concern that postwar liver extracts have not the same potency as prewar ones. Diseased livers unfit for food are used, of which possibly half are without pharmaceutic value. The more chemical processes through which liver extracts are put, the greater the risk of a subpotent preparation.

Recently cases have been reported of anemia refractory to highly purified preparations. If the batch from which the preparation was obtained has not been tested, it should not be concluded that the preparation was refractory, for it might be an inactive one. Wilkinson advised that if a patient did not respond to a preparation in a fortnight it should be changed.

As to folic acid, he had found that in 9 of 20 cases it did not prevent the development of neurologic lesions and in 60 of 184 reported cases neurologic lesions had developed. These might come on within a month of starting treatment. Folic acid did not maintain the majority of patients with pernicious anemia in normal health. There was a gradual falling off of the blood count. The effective dose was large in comparison with liver, and it did not relieve the neurologic symptoms.

As to the prognosis in pernicious anemia, Dr. Wilkinson compared cases before and after liver treatment was introduced. In 68 cases before the advent of liver therapy the average duration of life was six months. All but 1 patient died within nineteen months. In his group of patients 1,480 received liver or stomach treatment during the last nineteen years. Only 301 were dead, while of these, 105 had lived for five years and 149 for five to twenty years. Of those still alive, 1,032 had been under treatment for more than five years. One survivor was over 100 years of age; 7 were over 90; 99 were over 80; 500 were over 70. If patients with pernicious anemia were treated adequately with liver or stomach preparations they would get well and remain so.

MADRID

(From Our Regular Correspondent)

June 15, 1948.

History Of The Idea Of Disease

Dr. P. Lain Entralgo, professor of medical history in Madrid University, has given a series of lectures in the Hall of the Madrid Medical Association on the "History of the Idea of Disease." His starting point was the "higher primitive culture," so called by the ethnologists of the *kulturhistorische Schule*, in which disease was considered as a punishment from God and, in interpreting the mechanism of that punishment, two attitudes prevailed: one perceived it as a moral pain (Assyria and Babylonia) and the other saw it as a physical affliction (Indo-European peoples, ancient Greece). Witnesses to this physical interpretation of disease are the first canto of the Iliad and other passages in Homer's poems. The Assyrio-Babylonian conception led to a dead end, whereas the Hellenic one is the basis of all scientific medicine.

The physical idea of disease, worked out by the disciples of Hippocrates, culminated in Galen, for whom disease was a *diathesis para physin*, a preternatural disposition of the physiologic functions. According to Lain, this was how the first systematic general pathology came into being, which was so ample that it comprised, in Galen, even sin or moral disorders, as a preternatural disposition of the soul. For the Assyrians, the sick man was a sinner; for Galen, the sinner was a sick man.

Lain states that theoretic nosology is the history of the Galenic concept of disease, into which Paracelsus introduced an important novelty, the consideration of disease not only as a "state" but as a real and living "entity." Sydenham emphasized the share of reactive effort in disease and taught us to define diseases by their visible characters and not by their essence, as was attempted by Galen. On the other hand, he studied "chronic diseases" with an attention which led him to appreciate the "biographical moment" in human disease.

But the physician who is not satisfied with merely classifying the "morbid species," as was done by the followers of Sydenham, must ask himself what the morbid species really is, its real consistency. It is here that Boerhaave, Stoll, Morgagni and Bichat initiated the anatomoclinic system which was to culminate in Laennec, who taught us to define disease not so much by its symptoms as by the anatomic lesions and the physical signs by which lesions can be diagnosed in patients, thus closing the "Copernican cycle" of the anatomopathologic lesion postulated by Bichat and later by Laennec. This fulfilment was achieved by Bright, Rokitansky and Virchow.

The basic stages following this transformation of medicine by Laennec are as follows: (1) the symptom counteroffensive as a reply to the physical sign (functional tests) the physiopathology of Traube, Naunyn and Frerichs; the pathology of Kraus; the neurology of Jackson, von Monakow and Goldstein; (2) connected with the foregoing, the reintroduction into medical thought of the idea of biologic life achieved by bacteriology: disease as a vital fight: an example of this is Klebs's general pathology, and (3) absolutely new in the history of medicine, the penetration of the idea of personal life into the scientific consideration of the patient, the work of those doctors who have succeeded in understanding the revolutionary message of Freud: in Germany, the creators of personal pathology (Krehl, Siebeck, von Weizsaecker): in the United States, the cultivators of so-called psychosomatic pathology (Dumbar, Alvarez, Wolff). In this way, according to Lain, "medicine has started out to surpass, though without denying it, the purely physical conception of the Greeks. For the first time, medical thought seems to have reached a plenitude of motives although it has not achieved a plenitude of development."

In this course of lectures, Professor Lain Entralgo treated Spanish doctors and historians to an excellent philosophic view of disease. Like his previous course on the history of anatomy, this one provided a new orientation in focusing medical history.

Child Hygiene

In reporting on child hygiene, we shall not speak only of the Public Health Department under Dr. Palanca, which we dealt with in previous letters, but of other centers belonging to other ministries. Child hygiene in Spain is carried on by a series of units attached to different government departments. Intensification has taken place in the development of our puericulture institutions, the first impulse to which was given in 1935 with the establishing of a child hygiene clinic in every provincial capital. From then on state and state-protected works for the care of mothers and children have rapidly multiplied and are now numerous although not sufficient, especially in rural districts.

Institutions belonging to the various ministries and their scope are as follows:

A. *Ministry of the Interior.*—The work in this field done by the Public Health Department is done by the following institutions: in Madrid, the National Puericulture School and, in the provinces, twelve puericulture schools at Barcelona, Bilbao, Gijon, Malaga, Murcia, Santa Cruz de Tenerife, Seville, Valladolid, Valencia and Saragossa. The Madrid school has not been able to readmit a pediatrician of international fame like Dr. Jaso, who has been penalized for his collaboration with the Republican Government during the civil war, in which he did exemplary work; 5 nursing mothers' clinics (Barcelona, Bilbao, Madrid, Malaga and Seville); 194 pediatric clinics, 57 third degree (in important cities), 79 second degree and 58 first degree (practically rural). The number of clinics opened since the war is 133. There are 102 maternity clinics (60 third degree and 42 second), 50 of which have been opened since the civil war.

The Department of Charity and Social Works, in the Ministry of the Interior, has created child hygiene institutions and maternity centers within the Auxilio Social framework in nearly all the provinces, distributed as follows: (1) child feeding centers, 157; (2) maternity clinics, 24 (90 in project); (3) mothers' homes, 8.

By ministerial order, elementary child care is taught to all mothers registered at the maternity clinics, and an award known as "Exemplary Mother Diploma" has been founded. The Public Health Department carries on the monthly publication *Al Servicio de Espana y del Nino Espanol* and has stipulated the obligatory declaration of antidiphtheric vaccination. The Central Puericulture Institute has been founded, being the old children's wing of the Hospital del Rey.

B. *Ministry of National Education.*—To this belongs the so-called school medical corps. Although the child hygiene clinics of the state are also intrusted with the hygiene of school children, the doctors of this corps are the only ones who actually fulfil this important mission. There are school doctors in all the capitals of provinces and large townships. Since the civil war all vacant places have been filled with provisional nominees, and although competitive examinations were announced for definite appointments more than two years ago, these have not taken place yet.

C. *Ministry of Justice.*—Attached to this Ministry is the Young Persons Protection Board, which also maintains puericulture clinics.

D. *Ministry of Labor.*—Under this Department function the National Social Insurance Institute and Mothers' and Children's Fund. Until recently the latter was intrusted with giving sanitary and social assistance under the compulsory maternity insurance and family allowance schemes put into force in 1941 and 1931, respectively. Now both have been put under the national health insurance authorities.

Attached to the Ministry of Labor, too, are the following: (1) child hygiene clinics, 200; (2) maternity clinics, 240; (3) mothers' homes, 9.

E. *Falange Española Tradicionalista y de las JONS.*—In the feminine section of this political party there are 47 puericulture clinics.

To all these institutions belonging to the various ministries mentioned must be added the many created by provincial and municipal corporations over the country. All the child welfare institutions mentioned in this letter are decidely sanitary and social in character and, are generally well run and, if managed by one organization, would function admirably.

In many places where all the departments have branches or delegates, there is a multiplicity of offices and departments, while in others, or in other sectors of one same town, there are none or not enough. All this work represents a strong impulse toward the carrying out of ever more important work on behalf of children's health, but it seems to be hampered by the excess of foundations which interfere with each other's activities.

On July 12, 1942, the government issued the Mothers' and Children's Health Law promulgated by the Public Health Department. This tries to prevent interference between centers and services and contradictions between them; but, seven years have gone by since this act was passed, and coordination has not yet been achieved notwithstanding the desire for it on the part of all Spanish pediatricians. We are, therefore, faced with a contrast between the good intentions and ideas of all the authorities and defective functioning, the basic cause of which is the multiplicity of services.

TURKEY

(From Our Regular Correspondent)

Ankara, June 16, 1948.

Antirabic Campaign

The first antirabic institute in Turkey was established in 1887 in Instanbul. Professor Zoeros Pasha, who had studied at the Pasteur Institute in Paris was the director and Drs. Remzi and Rifat his co-workers. The institute was transferred in 1893 to Pera Nishan Tash, where it was directed by Professors Nicolle and August Marie. From 1896 to 1914 it was under the direction of Professor Remlinger and then for twenty years was under the direction of Remlinger's assistant Dr. Hayem Naoum who died in 1934.

A second antirabic institute was established during World War I in Sivas by Professor Tevfik Saglam Pasha. A third institute soon was established in Diyarbakir, a fourth in Konia and a fifth in Smyrna, and in time seventy-five more antirabic stations were established. When in 1933 the Refik Saydam Central Institute of Hygiene, where all vaccines and serums are prepared, was established in Ankara an antirabic institute was soon added under the direction of Dr. Abdulkadir Cilesix, who gained his experience at the Pasteur Institute in Paris.

At the first institute in Instanbul the original Pasteur method was employed. Later the Hogyes as well as the modified Högyes-Philips method came into use. At present the Semple method is the only one employed in the eighty antirabic stations of the country, whose establishment and work are shown in the accompanying tabulation.

Year	Number of Antirabic Stations	Persons Under Treatment	Deaths
1933	25	381	2
1934	25	1,077	1
1935	30	1,479	7
1936	34	1,994	9
1937	37	1,900	7
1938	52	2,501	2
1939	52	2,849	9

Patients dying of rabies in spite of prophylactic treatment are mostly those from rural communities who either came in late for treatment or whose case was of an extremely grave nature.

Though rare cases of rabies in horses, cattles, mules, donkeys and chickens have been recorded, there are none on record in camels, turkeys, geese or ducks. All cities and many towns have antirabic campaign stations, which once a month report to the Ministry of Health on the number of stray dogs and cats killed. In almost every home there are one or two pet cats. People dislike the idea of their pets being killed. Last March a rabid dog was at large in Ankara, and, before it was shot by the police in a crowded street, the dog had within five hours bitten 41 persons. Though from 600 to 700 stray dogs and from 300 to 400 stray cats are killed every month in Ankara alone, the number of stray dogs and cat never diminishes, because new arrivals soon fill the vacancies. Veterinary stations give persons an opportunity to have their pets vaccinated free of charge.

Regulations concerning the scheme of treatment for the fourteen, twenty and twenty-four day Semple treatment advocated by the Ministry of Health have been forwarded to all eighty antirabic stations. Once a month a report on the stations' activities and observations to the Ministry of Health is required. Sixty years of antirabic institutions plus health propaganda through posters, pamphlets and radio talks have made people so aware of the danger of rabies that at the slightest hint of danger they apply for treatment.

Streptomycin Therapy in Tuberculous Meningitis

Before the Turkish Medical Society of Istanbul Dr. Huseyin Salor of the Pera (Istanbul) Municipal Hospital reported a case of tuberculous meningitis successfully treated with streptomycin. A student aged 17 was admitted to the hospital with a temperature of 38.5 (101.3 F.); he was semiconscious and vomited. As there was no localization he was given a sulfonamide drug, but the next day there developed a squint, stiffness of the neck and unconsciousness. Lumbar puncture produced a clear cerebrospinal fluid of high pressure, 150 Nageotte's cells (elements), 120 cg. of albumin and 0.50 cg. of glucose. Microscopic examination revealed only lymphocytes. The Pandy test gave a 3 plus reaction, the Wassermann test 2 plus and the tryptophane test 4 plus. Threads of fibrin floated at the bottom of the test tube containing cerebrospinal fluid. Kernig and Brudzinski signs were positive; moaning, delirium, photophobia and hypersensitivity appeared; the abdomen was sunken and the pulse was weak at 60 to 70 a minute. Twenty-five grams of streptomycin was procured. Treatment began on the eighth day from the onset and on the third hospital day. For seven days 2 Gm. of the drug was injected into the patient intraspinally; part of the solution was given intramuscularly. The improvement on the day after administration of the first dose was amazing. On the fourth day the squint, photophobia, hypersensitivity, stiffness of the neck and the headache had disappeared, the Kernig and Brudzinski signs decreased and the patient had regained consciousness and sat up in bed. After an interval of seven days the streptomycin treatment was repeated for ten days, but this time only 1 Gm. was given, of which 50 mg. was given intraspinally and the rest intramuscularly. At the end of the treatment the temperature had returned to normal, After another seven day interval a third series of 1.5 Gm. of streptomycin was begun, but on the sixth day the temperature began to rise and the patient had pain in the legs and was unable to void, streptomycin was discontinued and within two days the temperature returned to normal. The patient remained in the hospital for twenty more days and was given large doses of vitamins A, B_1 and C. He was now able to walk. He had received 43 Gm. of streptomycin. Against advice he was taken for convalescence to a resort near Bursa, where twenty-six days later and forty-four days after onset of the disease, symptoms reappeared. On readmission to the hospital the patient was delirious and violent, had slight fever and also a slight and high cerebrospinal fluid pressure. For four days he was given a daily dose of 1.5 Gm. of streptomycin of which every other day 100 mg. was given intraspinally and the rest intramuscularly. After a seven day interval he was again given a ten day treatment beginning with 1 Gm. daily, which was gradually reduced to 0.5 Gm. After another seven day interval, a third course of streptomycin treatment was given, so that the patient received a total of 96 Gm. His condition has greatly improved, but from time to time, accompanied by excitement and sometimes delirium, sudden severe headaches terminate with vomiting after one and a half hours. The cerebrospinal fluid pressure is still high; other reactions are negative. The patient, who for five and a half months was subjected to many injections, refuses to submit to any more lumbar punctures. After he left the hospital only once has he permitted a lumbar puncture; then 20 cc. of fluid was taken, after which he was free from attacks for three days.

In the middle of 1946 streptomycin first came to Turkey. Its wider use depends on its price. It can be procured only from the Red Crescent Society and and only on prescription; priority is given to hospitals. Streptomycin sold in pharmacies costs $5 for 1 Gm.

Efficacy of Antihistaminic Agents in Epilepsy

Lennox in the *Journal of Pediatrics* (29:356, Sept. 1946) says: "From the caveman to bromide, thousands of years; from bromide to phenobarbital, seventy-five years; from phenobarbital to diphenylhydantoin, twenty-five years; from diphenylhydantoin to trimethyloxazolidine dione, eight years. At this threefold rate of acceleration, we should have yet another effective remedy by the spring of 1948!" And in the spring of 1948 V.M. Buscaino, director, Neurologic Clinic, University of Naples, reported before the Campana section of the Italian Neurologic Society on the efficacy of small doses of antihistaminic agents in epilepsy. For months he and his pupil Lavitola administered to many patients with severe epilepsy an Italian antihistaminic product, the formula of which comes near to that of the Swiss "antistin" or the American "pyribenzamine." He observed that in the long run this treatment is superior to that with phenobarbital sodium. The attacks become less frequent and are of short duration when they occur. Buscaino has contended many times that epilepsy is always connected with an allergic mechanism. This point of view has been strengthened by a more detailed concept of some allergic reactions limited to certain organs, as in cases of glomerulonephritis from streptococcic infection of the tonsils (Lowell, F.C.: The Newer Concept of Allergy to Drugs and Bacteria, J.A.M.A. 136:665 [March 6] 1948) and in the paper by G. Bikel of the University in Geneva, on agranulocytosis of medicamentous origin. While Busciano's report received much attention in the Italian medical world, more profound proof is required. It seems likely that skin tests will be instituted, perhaps of the type suggested by Bukantz and Dammin in *Science* (107:224. 1948) by virtue of which the skin of epileptic patients before and after they have been treated with antihistaminic agents may be examined for fluorescence with ultraviolet rays after an injection of fluorescein. From these tests one may conclude whether the reduced incidence and the lesser severity of the attacks may be due to the effect of the antihistaminic agents on the neutralization of histamine.

Myocardial Infarction Following Intravenous Injection of Epinephrine

In *Il progresso medico*, May 1948, a paper by Mattioli deals with myocardial infarction following intravenous injection of epinephrine. Research by Meyer, Markwalder, Starling and Patterson revealed that epinephrine produces an acceleration of the coronary circulation. According to Brodie and Cullis, small doses of the drug cause vasoconstriction, but large doses, after a short phase of constriction, may produce vasodilatation, while exactly the reverse occurs in the other vessels. The first of Mattioli's 2 patients had a recurrence of malaria; because of resistance to quinine, treatment with epinephrine was instituted. With the third intravenous dose of epinephrine, which by mistake was 0.1 mg., the patient complained of sudden precordial pain and then of severe epigastric pain radiating to the neck, mandible and left shoulder. The pulse rate was 130, faint and arrhythmic. The patient had the feeling of dying. After several minutes the pulse rate dropped to 100 and became regular. The pain persisted. The man was given an injection of morphine-atropine. After a quarter of an hour the pain subsided. The blood pressure was 110 systolic and 80 diastolic. Next day the temperature was 37.6 C. (99.6 F.); the sedimentation rate was 22; the white blood cell count was 10,000. Electrocardiographic tracings revealed an extrasystole in lead 1, mild deflection in the QRS complex in all leads, presence of a Q wave in the second and third lead with an abnormal ST segment and a strongly negative T wave. The diagnosis was infarction of the posterior part of the left ventricle. The attack was repeated during the night, and the patient, aged 49, died.

The second patient, a man aged 51 who also had malaria, presented the same clinical picture after the intravenous injection of epinephrine. The electrocardiogram disclosed mild abnormalities in all the leads. The diagnosis was infarction of the posterior region of the left ventricle. Mattioli stated that one should not underestimate the effect of epinephrine, which is a highly valuable antiallergic drug; but as these cases revealed, treatment should be instituted only after making sure that the heart of the patient does not present some hidden anomaly which may be responsible for accidents in the office of the physician. Mattioli as well as Levine and Katz emphasized that epinephrine is innocuous in persons with a perfectly normal heart. But signs of arteriosclerosis may always be expected in persons over 45 years of age, particularly if in addition they have chronic malaria or other debilitating diseases.

Physician Imprisoned for the Epidemic of Varese

After a trial of more than one month and a verdict elaborated in sixteen hours, as reported in a previous letter, the physician of Varese who had been accused of disseminating by his imperfect technic an epidemic of "syringe hepatitis" was sentenced to serve five years in prison, to discontinue practice for 2 additional years and to compensate the families of the victims, of whom 12 had died and an additional 100 were infected. The entire nation has been interested. The sentence seems terrible, for in 1946 nobody in Italy knew anything about infection with hematogenous hepatitis through imperfect sterilization of the syringe. The physician of Varese gave no less than fifty intravenous injections of a tonic to his patients every day. Since then the Italian public has been told of the American literature, particularly the views of Dr. Thomas River, who spoke at the Annual Session, Atlantic City, N.J., June 13, 1947, and the paper on epidemic hepatitis by the Chicago doctors Capps, Sborov and Scheiffley, which appeared in THE JOURNAL, March 20, page 819.

The trial had aroused the entire medical profession in Italy because the incriminated physician had an excellent reputation. The defense council will apply to the Court of Appeal, but for the moment the physician, who had enjoyed liberty conditionally, has been imprisoned.

Correspondence

NEOSTIGMINE TOXICITY

To the Editor:—In "Clinical Notes," page 362 of THE JOURNAL, May 22, 1948, an article entitled "Neostigmine Toxicity" by Dr. George G. Merrill reports the first fatality presumably due to neostigmine to be found in the literature. As author of an article entitled "Intravenous Neostigmine in Diagnosis of Myasthenia Gravis," accepted for publication in the *Annals of Internal Medicine,* I feel obligated to comment on this report.

The standard test for myasthenia gravis proposed by Viets and Schwab, and referred to but not described by Dr. Merrill, consists of the intramuscular injection of 1.5 mg. of neostigmine methylsulfate in combination with 0.6 mg. (gr. 1/100) of atropine in a single ampule. In spite of over twelve years of intensive experience with this test by these authors at Massachusetts General Hospital, as well as its use in other institutions throughout the country during this time, no fatalities or extremely severe reactions have been reported. This fact has been confirmed in a personal communication from Dr. Viets received June 7, 1948. It is possible, as Dr. Viets points out, that this record has been achieved by the use of atropine with each injection and by the use of additional atropine immediately on the appearance of any untoward effects. However, it should be emphasized that in addition to its diagnostic use in myasthenia gravis, neostigmine has been employed extensively for postoperative distention, arthritis and neuromuscular disorders, as a test for pregnancy and in many other conditions too numerous to mention. For these various entities, it has been administered intramuscularly and orally, in most cases without atropine, and, until this case, no fatalities have been reported.

In our experience with the intramuscular use of neostigmine as a diagnostic agent in myasthenia gravis, the response in some of the milder cases was slow and somewhat indefinite. It seemed to me that intravenous neostigmine might give a more prompt and complete muscular recovery. Animal studies of neostigmine toxicity by Aeschlimann and Reinert (*Journal of Pharmacology and Experimental Therapeutics,* **43**:413-444, 1931) indicated that neostigmine was about twice as toxic intravenously as intramuscularly. Therefore, for the initial intravenous dose it was decided that one third the standard intramuscular dose, or 0.5 mg. (1 cc. of 1:2.000 solution) of neostigmine should be given in a timed one minute period. This test was first given to a myasthenic patient in 1942 and resulted in complete recovery of all muscular functions in less than two minutes, without any side effects whatsoever. A syringe containing atropine sulfate, 0.6 mg. (gr. 1/100), was kept in readiness at all times and has been given at the first sign of any untoward reaction. Atropine has not been given with neostigmine because, as Viets has pointed out, the usual heightened tolerance of myasthenic persons to parasympathetic stimulation by neostigmine is such that the occurrence of any side effects almost rules out the disease.

Since 1942 we have given intravenous neostigmine to several hundred patients and have seen side effects in only a few nonmyasthenic persons or persons with extremely mild myasthenia. These reactions consisted of mild abdominal cramping, muscle fasciculations, flushing and sweating, mild vertigo, nausea and diarrhea. The pulse rate was occasionally diminished but never more than 10 beats per minute, and the reduction in blood pressure was negligible. All reactions encountered were abolished in a few minutes without exception by the subcutaneous injection of 0.6 mg. (gr. 1/100) of atropine sulfate. Although we have never encountered a severe reaction with intravenous neostigmine, we would not hesitate to give atropine in even larger amounts intravenously should parasympathetic shock occur.

In 1942 there were only 4 cases on our records. Since that time we have diagnosed 30 more, many of which we feel would have gone undiagnosed were it not for this test.

Nevertheless, the report of a death occurring as a result of one-third the usual intramuscular diagnostic dose of neostigmine deserves careful analysis by all physicians interested in the diagnosis and treatment of myasthenia gravis. It is possible, as Dr. Merrill suggests, that the convulsion in this patient, spontaneous or induced, may have by its excessive neuromuscular activity produced an overwhelming amount of acetylcholine, protected by neostigmine, as it probably was, from destruction by cholinesterase. Moreover, as Dr. Merrill further suggests, the probability of an individual hypersusceptibility to neostigmine should be considered here. Cases of hypersusceptibility have been recorded in the literature to practically every active useful drug in the pharmacopeia.

Dr. Merrill should be complimented on promptly reporting this first case of fatality due to a drug as extensively used as neostigmine. This report should certainly inspire caution in those who would use the drug promiscuously without due regard for sound indication and contraindication. But it is to be hoped that the report will not unduly prejudice against the use of neostigmine in the diagnosis and treatment of myasthenia gravis, a disease in which it has achieved such a brilliant specific record

J. EDWARD TETHER, M.D.,
Department of Medicine,
Indiana University Medical Center.

To the Editor:—With great interest we noted the article of George Merrill in the May 22 issue of THE JOURNAL entitled "Neostigmine Toxicity: Report of Fatality Following Test for Myasthenia Gravis." To emphasize the advisability of awareness of the untoward reactions attendant on the use of neostigmine, we call attention to observations on patients in whom pulmonary edema developed after treatment with therapeutic doses of neostigmine orally in February 1947. Our report, in which we discussed the implications of the connection between neostigmine and pulmonary edema, was accepted for publication by *Annals of Internal Medicine* in December 1947.

E. ADELSON, M.D., AND F. BRUNN, M.D., New York.

STREAMLINING THE HEALTH EXAMINATION

To the Editor:—Just a word of caution in regard to streamlining the health examination. It may be true that sixteen symptoms, twenty-three physical abnormalities and six laboratory observations will enable the physician to recognize the two hundred diseases which trouble 98 per cent of patients (THE JOURNAL, May 15, p. 244). However, this implies that if the streamlined technic is used, the remaining 2 of every 100 patients who consult a physician will receive mistaken diagnoses and consequently inadequate or even harmful advice.

The chiropractor or faith healer with a magnetic personality prospers because nine times out of ten correct diagnosis and treatment are not a matter of life and death. It is the tenth fatality that makes him dangerous.

If physicians are content with slick ten minute opinions, 2 or 3 million people may suffer because they have not been given the careful consideration which is their due.

ROBERT W. BUCK, M.D., Boston.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Osteopaths: Right to Practice Optometry Without a License.—This was a suit under the declaratory judgment act for an adjudication that the defendant osteopath was not entitled to practice optometry and to enjoin him from so doing. From a judgment in favor of the defendant, the plaintiffs appealed to the Supreme Court of Arizona.

At the time of bringing this action, and for some time prior thereto, the defendant, a licensed osteopathic physician, was engaged in the practice of optometry. The defendant did not claim the right to so practice by virtue of a license under the optometry act but rather by reason of being a licensed osteopathic physician. Section 67-1407, A.C.A., 1939, being a part of article 14 regulating optometry, provides: "This article shall not apply to physicians licensed to practice under the laws of this state." The defendant contended that he is a "physician" "licensed to practice under the laws of" Arizona, that the statutory provisions requiring a person to be licensed as an optometrist before practicing optometry therefore have no application as to him and that his license to practice osteopathy entitles him to engage in the business of prescribing and furnishing eyeglasses in the manner defined in the statute as constituting the practice of optometry.

The assignments of error raised one question: Is the defendent, a licensed osteopathic physician, authorized to practice optometry without obtaining a license under the optometry act? The plaintiffs contended that a person licensed to practice osteopathy is not a "physician" within the meaning of the optometry act and that a license to practice osteopathy does not authorize one to practice optometry.

The Arizona law regulating the practice of medicine provides for a board of medical examiners consisting of five members, four members to be graduates of schools recognized by the American Association of Medical Colleges and one to be a graduate of a recognized school of osteopathy. Three forms of certificates may be issued by this board of examiners: first, a certificate authorizing the holder thereof to practice medicine and surgery; second, a certificate authorizing the practice of osteopathy, and third, a reciprocity certificate. All applicants are subject to the same regulations, except that osteopaths, instead of filing a diploma from a legally chartered school of medicine, are required to file a diploma from a legally chartered college of osteopathy. Applicants for certificates as osteopathic physicians or as medical doctors are identified by number only, and identical questions on identical subjects are asked of all applicants. Under this law, the defendant was examined for his license to practice as an osteopathic physician. He took the identical examination taken by those seeking a license to practice as medical doctors and as a result of this examination was issued a certificate by said board of medical examiners to practice osteopathy within the state. The medical practice act section which defines the practice of medicine provides: "Practicing medicine shall include the practice of osteopathy."

It would seem, the court continued, that at all times our legislature has classified osteopaths with medical doctors, until a separate osteopathic board was established in 1941 which set up a somewhat different board of examiners and method of examination but did not materially change the qualifications and requirements. Under the original law the osteopath was authorized to practice medicine and under section 67-2103 of the amended osteopathy act it is provided that the "practice of medicine . . . by persons authorized under the (previous) laws of this state . . . shall in no way be affected by the provisions of this act." Thus, said the court, the legislature in its various acts has provided equal qualifications and requirements in the licensing of medical doctors and osteopaths; has provided that the practice of medicine shall include the practice of osteopathy; has referred to one practicing osteopathy, both in statute and in certificate, as an osteopathic physician; has provided that osteopaths may practice medicine and minor surgery, and, after two more years in a properly approved hospital, major surgery in osteopathically controlled hospitals or institutions. Furthermore, said the court, the narcotics act of Arizona defines a physician as "a person licensed to practice medicine, or osteopathy." To the court it therefore did not seem consistent that the legislature, in exempting "physicians" from the provisions of the optometry act, intended to except medical physicians but not osteopathic physicians. Nor did it seem consistent with reason, the Supreme Court concluded, that the criminal code of Arizona providing penalties for certain acts of a physician would exempt an osteopathic physician or that under the statute of privileged communication the patient of an osteopathic physician would not be given protection identical with that of the patient of a medical physician.

In conclusion, the Supreme Court said: "It seems that through our legislative history and background the word 'physician' has been employed in its generic and broad sense, and the intent to include osteopathic physicians seems to be clear. We cannot say that the legislature intended the word 'physician' in the Optometry Act to include only the medical physician and exclude the osteopathic physician." Accordingly the judgment in favor of the defendant was affirmed.—*Gates v Kilcrease, 188 P. (2d) 247 (Ariz., 1947).*

Dental Practice Acts: Constitutionality of Regulation of Dental Laboratory Technicians.— The state filed a petition to restrain the defendant, doing business as the Serv-U Dental Laboratory, from practicing dentistry without a license. From a judgment for the plaintiff, the defendant appealed to the Supreme Court of Alabama.

The Alabama dental practice act provides that a person shall be said to be practicing dentistry who constructs or repairs dentures from impressions made by anyone other than a licensed dentist and to be delivered to anyone other than a licensed dentist, "Provided, however, that nothing in this chapter shall prevent . . . any person . . . connected with a commercial dental laboratory from the performance of mechanical work on inanimate objects only in the construction or repair of dentures, . . . or other dental appliances, provided that impressions, casts or measurements for such work shall have been made or taken by a dentist licensed to practice as herein provided for, and that said construction or repair shall be done only on his or her authorization, and to be delivered only to a dentist licensed to practice as herein provided for."

The defendant, a dental laboratory technician, opened the Serv-U Dental Laboratory at Montgomery, Ala., and for some time performed his work under the instructions and authorization of licensed dentists and delivered the finished product to the dentist. Subsequently, however, he began doing certain work, such as repairing and replacing dentures, without instructions or authorizations from licensed dentists, dealing directly with those for whom the work was done and charging and collecting a fee therefor.

The defendant argued that the burden was on the state to prove that he was practicing dentistry as defined in the act and contended that proof that he repaired or duplicated existing dentures without the use of any impressions, or without the use of a model or cast made from an impression, was insufficient to prove the practice of dentistry, which was alleged to consist solely of the manufacture or delivery of dentures from a model or cast made from such impression. He insisted that the duplication or repair of existing dentures, without the use of any impression, or model or cast made from such an impression, did not constitute the practice of dentistry as defined by the statute.

To adopt such a rigid and literal construction of the statute forces a result which we think the legislature never intended, said the Supreme Court. The defendant admitted constructing dentures without instruction or authorization from a licensed dentist on models or casts prepared from existing dentures, which in turn had been made on a model or cast made from an impression taken by a licensed dentist. The dentures made by defendant were, in legal effect, the same as if the models used by him had been made from impressions taken by licensed dentists in the first instance. And they were made without instructions or authorization from a licensed dentist and were delivered, not to a licensed dentist, but directly to the person for whom made. We cannot cast aside our common sense in trying to arrive at the intent of the legislature, the Supreme Court continued. If there are reasons for requiring that dentures made from models or casts made from an impression be made only on the instructions or authorization of licensed dentists, the same reasons, unquestionably, require that the methods employed by the defendant should likewise be employed under the instructions or authorization of licensed dentists. The proviso makes it clear that the methods employed by the defendant or the services performed by him, as shown by the record, must be employed or performed only on the instructions or authorization of a licensed dentist, and that the finished product must be delivered to a licensed dentist. We are clear to the conclusion that such was the legislative intent. The methods of procedure employed by the defendant are, we think, but an effort to circumvent the plain intent of the legislature.

The defendant also contended that if the statute prohibits him from doing the work admittedly done by him in the manner shown, then it is unconstitutional and void because it contravenes the Fourteenth Amendment to the Constitution of the United States, and article I, section 6 of the 1901 constitution of the state of Alabama. As we understand it, the Supreme Court said, the defendant's argument in this regard is based on the following reasons: that the construction or repair of dentures in a commercial dental laboratory, or by a technician, by the performance of mechanical work on inanimate objects, is a separate occupation, that the statute prescribes no standards for qualifying to engage in that occupation and leaves to the arbitrary and unbridled discretion of individual dentists whether any person shall be permitted to engage in that occupation; that the right to earn a livelihood by following the ordinary occupations of life is a fundamental, natural, inherent and inalienable right, sacred and valuable, and fully protected by our fundamental laws. Under the police power, said the Supreme Court, the legislature may impose such restrictions on the practice of dentistry as the protection of the public may require. We think that the legislature could have legally prohibited anyone not a licensed dentist from doing the work authorized in the proviso and it is not unusual for a statute to provide that a person performing an act under instructions and with the authority of one duly licensed to do the act is not guilty of practicing without a license. The pertinent section of the Alabama dental practice act does not recognize the operation of a commercial dental laboratory, or any part of that operation, but provides that the construction or repair of dentures and dental appliances is a part of the practice of dentistry. It does permit the dentists to avail themselves of the services of a nondentist and of commercial dental laboratories, provided that the work is done on the dentist's instructions and authorization and that the completed product is delivered to the dentist. All persons not licensed to practice dentistry may engage in this work on exactly the same basis. The section does not deny to defendant, or anyone else so situated, any right guaranteed by the Constitution of either the United States or the state of Alabama. Accordingly, the judgment excluding the defendant from the practice of dentistry was affirmed. —*Weill v. State ex rel. Gaillard, 34 So. (2d) 132 (Ala., 1948).*

Medical Motion Pictures

FILM REVIEWS

A Clinic on Deafness. 16 mm., color, sound, 1,299 feet (one reel), showing time thirty-three minutes. Prepared in 1946 by Samuel J. Kopetzky, M.D., and Ralph Almour, M.D., Otolaryngological Service, New York Polyclinic Medical School and Hospital; New York. Produced by Medical Film Guild through a grant for postgraduate instruction in otology by the Auralgan Research Division. Procurable on loan from Medical Film Guild, 167 West Fifty-seventh Street, New York 19.

This film attempts by animation and actual photography at the operating table to present the known theories and the physiology of hearing, diagnostic methods to determine the hearing range and therapeutic methods, both medical and surgical. The authors present their own theories as to the physiology of hearing and deafness. One concerns itself with the function of Reissner's membrane and the other, the influence of a certain type of vitamin and endocrine administration on deafness. Both are still unestablished.

Apparently the authors would minimize reported results of success of the fenestration operation for otosclerosis. In charts they show results of the operative procedure and those in which the vitamin therapy was employed. The latter material is presented in such a way as to indicate to the viewer a wish to play down the value of the operation and to foster the nonauthentic results of medical therapy. This attitude is expressed even though a great many exposures are devoted to showing enlarged views of the fenestration procedure.

While admittedly the newer modalities of hearing reeducation in form of speech reading, amplification by hearing aids and auditory training have proved extremely valuable in the reeducation of the deaf, little of the film is devoted to this phase. As the film does not have sufficient material to justify its general acceptance, and because it represents one side of a number of questions, it certainly could not be classified as a teaching film to be shown to a group of postgraduates in otolaryngology. For the most part, the photography is excellent.

Modern Trends in Intravenous Therapy. 16 mm., color, silent, 890 feet (one reel), showing time thirty-seven minutes. Prepared in 1947-1948 by Robert L. Petterson, M.D., Department of Anesthesiology, and George L. Wessels, M.D., Allegheny General Hospital, Pittsburgh. Produced by Mervin W. La Rue, Inc., Chicago. Procurable on loan from Abbott Laboratories, North Chicago, Ill.

Preparation of standard intravenous trays followed by the administration of a simple venoclysis are presented. Supplemental injections of drugs through the air filter of a specific type of apparatus, as well as the connection of containers in series, are demonstrated. The use and value of the "venopak" disposable equipment are stressed.

The management of blood donors is discussed and demonstrated, followed by the illustration of the collection, examination and storage of blood and plasma. The freezing of plasma and its preparation for administration are shown. Blood is administered through the "venopak" disposable apparatus.

This film is of value mainly to those interested in the use of a specific type of apparatus and of the "venopak" disposable equipment or in some of the salient facts dealing with a blood bank. The use of the term A. C. D. solution for anticoagulant citrate dextrose solution, U.S.P. XIII, is not of educational value. The insertion of some text dealing with the indications for the use of plasma or blood would enhance the general value of this film. Demonstration of other types of apparatus now employed for modern parenteral therapy would be wise from the teaching standpoint.

Photography is excellent, artistic and colorful, although there is the impression that the substitution of more close-up views of procedures would be more instructive than some of the scenes in which faces of persons distract from the essential point being made. Perhaps elimination of rings on nurses' hands would be less distracting and more professional.

This film is recommended for medical students, hospital administrators, anesthesiologists, nurses and any physicians concerned with blood banks and parenteral therapy.

HIGH SPEED MOTION PICTURES OF THE HUMAN VOCAL CORDS. 16 mm., black and white, silent 750 feet (one reel), showing time thirty-one minutes. Produced by: Bell Telephone Laboratories, Procurable on loan from: Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10.

This film shows an apparatus developed by the Bell Telephone Laboratories for high speed photography (4,000 frames per second) of the human vocal cords. The camera, lighting system and technic used to obtain the mirror pictures of the larynx are illustrated, and a graphic demonstration of the meaning of speed of 4,000 frames per second is shown. Animation briefly describes the position and action of the vocal cords.

Mirror views taken during the production of various vowel sounds of different intensity and pitch are used to demonstrate the normal larynx. Differences in the action of the cords in the trained and untrained voice are shown. The effect on the larynx of changes in resonance produced by the use of helium gas and a closed oral cavity is presented In addition to these fundamental physiologic studies, the cords are shown during whispering, phonation on inspiration, the production of a falsetto note, and during cough. The physiology of phonation is thus illustrated, although attempt is not made to interpret the actions of the cords from the standpoint of controversial concepts of physiology or to draw any conclusions from the photographs themselves.

This film is without doubt an outstanding contribution to medical photography; nevertheless, the distribution of the film need not be limited to a medical audience. It should be suitable for showing to physiologists, otolaryngologists, medical students and lay audiences studying voice and speech problems.

Feeding The Infant During The First Year. 16 mm., black and white, sound, 1,100 feet (one reel), showing time twenty-four minutes. Prepared in 1947 by Alan Brown, M.D., F.R.C.P. (London), professor of pediatrics, Faculty of Medicine, University of Toronto, Canada. Produced by and procurable on loan from Mead Johnson & Company, Evansville 21, Ind.

This is a lecture type film with the use of a few charts based on the author's views of infant feeding. He is pictured standing at a podium delivering a lecture. The content is excellent. The film will be of especial interest to pediatricians and others interested in the subject. It will also be of interest to the author's multitude of former students, both undergraduate and graduate.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

BOARD OF MEDICAL EXAMINERS
BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL, July 10, page 988.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I & II.* Various centers, Sept. 13-15. Final date for filing application is Aug. 13. Exec. Sec., Mr. Everett S. Elwood, 225 South 15th St., Philadelphia 2. *Part III.* Boston and New York, Autumn. Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY: *Written.* Various Centers, Jan. 21, 1949. Final date for filing application is Oct. 1. *Oral,* Philadelphia, Oct. 10, Sec., Dr. Paul M. Wood, 745 Fifth Ave., New York 22.

AMERICAN BOARD OF DERMATOLOGY & SYPHILOLOGY: *Oral. Groups A & B.* Ann Arbor, Oct. 21-23. Final date for filing application is Aug. 2, 1948. *Written.* Ann Arbor, Sept. 9, Sec., Dr. G. M. Lewis, 66 E. 66th St., New York 21.

AMERICAN BOARD OF INTERNAL MEDICINE: *Written.* Oct. 18. Asst. Sec., Dr. W. A. Werrell, 1 W. Main St., Madison 3, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral.* Chicago, June 1949. Final date for filing application is Jan. 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: *Part I.* Various Centers, Feb. 4, 1949. Final date for filing application is Nov. 1. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 1.

AMERICAN BOARD OF ORTHOPEDIC SURGERY: *Part II.* Chicago, January 1949. Final date for filing application is August 15. Sec., Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14.

AMERICAN BOARD OF OTOLARYNGOLOGY: *Oral.* Chicago, Oct. 5-8. New York City, Spring, 1949. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PATHOLOGY: Chicago, Oct. 8-9. Final date for filing application is Oct. 1. Sec., Dr. Robert A. Moore, 507 Euclid Ave., St. Louis.

AMERICAN BOARD OF PEDIATRICS: Seattle, Sept. 10-12. Atlantic City, Nov. 17-19. *Written.* July 30. Sec., Dr. Lee F. Hill, 718 Royal Union Bldg., Des Moines, Iowa.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in *June and November of each year in the hometown of applicants.* Sec.-Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF RADIOLOGY: Nov. Final date for filing application is Sept. 1. Sec., Dr. B. R. Kirklin, 102-110 Second Ave., S.W. Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written.* March 1949. Final date for filing application is Dec. 1. Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: Chicago, Feb. 12-16, 1949. Final date for filing application is Sept. 1. Sec., Dr. Harry Culver, Route #13, Sunnyside Rd., Minneapolis 4.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Immediate Electrocardiographic Effects of Circumscribed Myocardial Injuries: Experimental Study. R. D. Pruitt and F. Valencia. -p. 161.

Varied Clinical Syndromes Produced by Dissecting Aneurysm. S. Baer and H. L. Goldburgh. -p. 198.

Effect of Local Compression upon Blood Flow in Extremities of Man. M. H. Halperin, C. K. Friedland and R. W. Wilkins. -p. 221.

Functional Pathology of Experimental Immersion Foot. K. Lange, D. Weiner and L. J. Boyd. -p. 238.

Therapy Directed at Somatic Component of Cardiac Pain. S. H. Rinzler and Janet Travell. -p. 248.

*Combined Heparin-Dicumarol Therapy of Myocardial Infarction. Clinical and Pathologic Study. Helen I. Glueck, V. Strauss, J. S. Pearson and J. McGuire. -p. 269.

Determination of Prognosis of Pregnancy in Rheumatic Heart Disease. J. J. Bunim and Jeanette Rubricius. -p. 282.

Newer Concept of Stokes-Adams Syndrome. S. Schnur. -p. 298.

Analysis of Causes of Right Axis Deviation Based Partly on Endocardial Potentials of Hypertrophied Right Ventricle. C. E. Kossmann, A. R. Berger, J. Brumlik and S. A. Briller. -p. 309.

Fluorocardiography (Electrokymography): I. Technical Aspects. A. A. Luisada, F. G. Fleischner and M. B. Rappaport. -p. 336.

Heparin-"Dicumarol" Therapy of Myocardial Infarction.—Combined heparin-"dicumarol" therapy has been used by Glueck and associates in 25 cases of acute myocardial infarction. The control group of 25 patients was obtained by omitting anticoagulants in every other patient with myocardial infarction admitted to the hospital. Supportive treatment was identical in the treated and untreated cases. Although the series of cases is too small, and the variables of the disease itself too wide to make statistical analysis significant, it appears that the use of heparin-"dicumarol" adds no additional hazard to the treatment of acute myocardial infarction. There were 8 deaths in the control series and 3 deaths in the series treated with the anticoagulants. In the 3 treated cases that were fatal, necropsies revealed neither mural thrombosis nor embolism, although 2 of the patients died within forty-eight hours after the onset of symptoms. One patient showed incomplete rupture of the ventricle with hemorrhage into the pericardium. Emboli occurred in 6 of the 25 cases in the control series and possibly in 1 of the 25 cases with anticoagulant therapy.

*Therapy of Severe Erythroblastosis Fetalis with Repeated and Massive Exchange Transfusions. A. S. Wiener, I. B. Wexler and A. Shulman. -p. 141.

Exchange Transfusions in Severe Erythroblastosis Fetalis.—Wiener and his co-workers report 2 cases in which antepartum Rh tests indicated that stillbirths were inevitable if the pregnancies were allowed to go to term. The pregnancies were terminated prematurely by cesarean section and the infants were treated by exchange transfusion. In the first case an exchange transfusion of 500 cc. of blood was given. When the infant exhibited progress of the disease despite the treatment, a second exchange transfusion was given on the following day, after which the disease was arrested and recovery followed. In the second case an infant weighing only 4½ pounds (2,041 Gm.) at birth received a massive exchange transfusion in which 1,000 cc. of blood was injected and 950 cc. removed. This infant became jaundiced but did not show signs of toxicity, and the jaundice cleared within a fortnight. The gratifying results obtained in these 2 difficult cases most likely can be ascribed to the more complete replacement by Rh-negative cells of the infants' Rh-positive cells which were coated by antibody. Certain simplifications in the technic of exchange transfusion are described which speed up the procedure and make it less tiring to both the patient and the operators.

Bacteriology of Diarrheal Diseases. A. J. Cantor. -p. 60.

High Serum Acetylcholine Concentrations in Pernicious Anemia.—According to Davis, continued injections of acetylcholine into dogs caused hyperchromic anemia which was responsive to antipernicious anemia treatment. A relatively simple method recently developed for the estimation of acetylcholine in serum made it possible to determine the concentration of this substance in the serum of anemic human beings. Serum cholinesterase activity was also estimated in anemic as well as apparently normal subjects. Five patients with pernicious anemia in relapse were found to have serum acetylcholine concentrations ranging from 15 to 33 micrograms per hundred cubic centimeters. These values were reduced to from 6.6 to 8.2 micrograms per hundred cubic centimeters, as observed on the fourth to seventh days of effective treatment, with pteroylglutamic acid, liver extract or "ventriculin" (proprietary preparation of desiccated hog stomach). Six healthy persons with normal erythrocyte counts had acetylcholine concentrations varying from 6.6 to 8.2 micrograms per hundred cubic centimeters of serum. Six patients with secondary anemia were observed to have serum acetylcholine concentrations which varied from 6.6 to 9.9 micrograms per hundred cubic centimeters. Serum cholinesterase activity was low only in the severest anemias. The presence of a high concentration of acetylcholine in the serum of patients with pernicious anemia during relapse raises the question whether the excess of this chemical might possibly be the ultimate chemical cause of the disease. This suggestion becomes more of a probability in view of the fact that acetylcholine has been shown to be capable of producing a hyperchromic anemia in dogs which is responsive to all treatments effective against pernicious anemia. Also in favor of this idea is the fact that the effective treatment of pernicious anemia reduces the acetylcholine concentration of the serum to normal before any increase in the erythrocyte count has occurred.

Treatment of Hemorrhoids and New Rectoplasty.—Carmel stresses that patients with extensive hemorrhoids pose a problem. If all the involved tissues are removed contractures are prone to follow. If all the abnormal tissue is not removed, the symptoms may not be eradicated completely or early recurrence may ensue. Contributions toward the solution of the dilemma include the creation of anal flaps in prolapsed strangulated hemorrhoids, suturing of the superior cut edge of the mucous membrane to the proximal fibers of the external sphincter muscle and creation of three or four isthmuses by suturing the cut mucous membrane to the corresponding cut skin and employing available external tags to aid in forming the isthmus while allowing the rest of the wounds to granulate. The author employs sliding skin grafts and relaxation incisions and occasionally anusotomy to aid in filling defects of the anal canal and to prevent contractures. After the hemorrhoidal tissues have been removed a graft is prepared by making an incision in the perianal skin about 1.5 to 2 cm. lateral to one or more of the wounds made by the dissection of the external hemorrhoids. At each end of this incision a radiating cut is made, thus creating a segment of skin detached at all its edges and attached only by its deep surface and capable of being slid without tension well up into the anal canal to the level of the cut edge of the mucous membrane. The medial edge of this skin graft is sutured to the superior portion of the external sphincter muscle and to the mucous membrane, which is not pulled down but rather the skin is pulled up to it. Thus, the anal canal becomes relined by tissue of ectodermal origin and the mucocutaneous border is reestablished at the proper level. Sometimes the incision which is made lateral to the anal margin releases the tension sufficiently to allow the skin to be pulled up to cover the defect completely, making it unnecessary to add the radiating cuts.

Primary Resection of Colon and Rectum.—Wangensteen and Toon review the experience at their clinic with restoration of intestinal continuity after excision of primary cancer of the rectosigmoid and rectum. They conclude that for all lesions in the rectosigmoid area 14 to 20 cm. from the anus the conservative operation affords the patient as satisfactory a prospect of cure as does the abdominoperineal operation. For lesions in the lower rectal segment, at 8 cm. or less from the anus, the conservative operation is not a good operation for primary rectal cancer, because it does not deal effectively with the invisible lateral spread of cancer as does the more radical abdominoperineal resection. In low-lying lesions a fairly high incidence of local recurrence strongly suggests that salvage of the rectal sphincters is accomplished at the risk of failing to cure the cancer. For suitable lesions in the midrectal segment, over 8 cm. from the anus, the conservative operation appears to be as satisfactory as the abdominoperineal; however, for fixed lesions, the abdominoperineal operation, undoubtedly the most radical operative procedure available, offers some advantage. Experience with low anastomosis is reviewed in a miscellany of indications in which the lesion together with a portion of the rectum was excised with reestablishment of intestinal continuity. The authors also recount the experience with primary restoration of intestinal continuity after excision of subtotal lengths of the colon and rectum for patients having chronic ulcerative colitis. The importance of preservation of the internal sphincter for the maintenance of fecal continence cannot be overemphasized. A satisfactory anastomosis made by the suture method 3 to 4 cm. above the pectinate line assures complete continence.

Nitrogen Mustard in Myelogenous Leukemia.—Siddon and Wells review the present status of nitrogen mustards (beta-chloroethylamines) in the treatment of cancer. They report 3 cases of chronic myelogenous leukemia in which patients were treated with methyl-bis (beta-chloroethyl) amine hydrochloride. The results arouse no great enthusiasm for this form of therapy. It is suggested that the combination of roentgen therapy and nitrogen mustard treatment may be expected to produce more beneficial effects than either of the two when applied alone.

Examination of Sputum for Tumor Cells.—Mathews states that examination of sputum for tumor cells as an aid in the diagnosis of bronchogenic carcinoma is not a new procedure. Prior to 1935 sporadic attempts to use this method of examination had little success except in occasional instances where fragments of tumor were expectorated. In that year Dudgeon and Wrigley first reported good results, and subsequently Dudgeon in 1936 and Barrett in 1938 reviewed the results achieved at St. Thomas's Hospital in London. In 1946 Papanicolaou reported positive results in 22 of 25 cases of proved bronchogenic carcinoma, and in 1947 Woolner and McDonald from the Mayo Clinic recorded positive results in 80 per cent of cases by use of a smear technic. The author reviews examinations of sputum for tumor cells at the Central Division of the Montreal General Hospital in the two year period 1945 to 1947. A positive diagnosis was made in 24 of 33 cases, either proved or reasonably certain of being bronchogenic carcinoma. A false positive diagnosis was made once in each of 2 cases. There were 9 cases in which the sputum was not demonstrated to contain tumor cells, 7 of these being proved by necropsy, biopsy or operation, and 2 cases having a probable clinical and radiologic diagnosis of bronchogenic carcinoma.

Diagnosis of Congenital Heart Disease.—Keith discusses the more commonly seen types of congenital heart disease in both the cyanotic and noncyanotic groups and outlines the cardinal points in diagnosis. He compares the value of the intracardiac catheter and angiocardiography. Both are necessary diagnostic aids in certain cases in which the pathologic process is not clarified by ordinary clinical means. Accurate diagnosis has become exceedingly important now that surgery offers treatment to many of these children.

Relief of Ulcer Distress by Vagotomy.—Dragstedt and his associates cite factors which indicate that the relief obtained by vagotomy is not due to anesthesia of the stomach, because the introduction of a solution of hydrochloric acid into the stomach during the first three or four days after the operation reproduces the pain. Trauma to the vagus nerves, including pinching, tying and cutting these structures in the patient under spinal anesthesia, does not produce pain. The sensation of hunger is not abolished by complete gastric vagotomy. Fear of perforation of a peptic ulcer without pain after gastric vagotomy, therefore, is a probably unfounded. The same, however, cannot be said after thoracolumbar sympathectomy. With the increasing employment of this procedure in the treatment of hypertension, more patients are being encountered who have both peptic ulcer and hypertension. There is some evidence that sympathectomy in these cases may cause rapid progression in the ulcer, but at the same time, produce relief of pain so that a painless perforation may occur. There is thus good reason to believe that the sensory nerves involved, both in the characteristic ulcer distress and in the pain produced by the liberation of the gastric content in the peritoneal cavity, are in the sympathetic nerves and not in the vagus nerves.

Gastroscopic Appearance of Mucosa After Vagotomy.—Since resection of the vagus nerves for peptic ulcer causes important changes in gastric physiology, namely, a precipitous decline of secretory activity and a lessening of motor power, Wolff decided on an investigation of the gastric mucosa before and after vagotomy. Eleven patients with peptic ulcer were subjected to gastroscopic examination before resection of the vagus nerves by the transthoracic approach. Eight patients had had roentgenographic evidence of duodenal ulcer and 3 had gastric ulcer. The gastric mucosa had a normal appearance in all but one of the patients with duodenal ulcer, and except for the ulcer craters the patients with gastric ulcer also had a normal mucosa. Repeated gastroscopic examination made eight days to eleven months after vagotomy revealed vast changes. The gastric lumen tended to be flabby, requiring large quantities of air for its inflation, due to loss of tone. Orientation landmarks within the stomach were altered: blunting of the angulus occurred, and obliteration of the antral sphincter was the rule. Ten patients had solid food in their stomachs partially blocking views of the greater curvature even though no examination was done less than fifteen hours after eating. Rugae remained on the greater curve in all cases although they often were shallower and wider apart than in the normal stomach. The mucosa itself was dull, reddened and lacked luster in 7 cases and was of normal appearance in 4. The retention of food may account for deepening in color and loss of brilliance.

Ligature of Arteries of Stomach for Gastric Ulcer.—Baronofsky describes experiments on dogs which demonstrate that ligation of three of the large arteries of the stomach, and additional small ones coming from the gastroepiploic arteries, fails to protect against the histamine-provoked ulcer.

*Antibody Response in Human Beings Inoculated With Japanese Encephalitis Vaccine, Chick Embryo Type. J. Warren, J. E. Smadel and A. F. Rasmussen. -p. 211.

Antibody Response to Japanese Encephalitis Vaccine.—Warren and his associates found that Japanese encephalitis vaccines which were prepared from infected mouse brain or chick embryo tissue, and were of adequate potency as measured by the standard mouse protective test, were equally effective in immunizing human beings when the vaccines were administered to soldiers in two doses of 2 cc. each given four days apart. In approximately 30 per cent of the men neutralizing antibodies developed following immunizations with either vaccine. In subjects immunized with 3 cc. of chick embryo vaccine given subcutaneously in doses of 1 cc. on the first, seventh and thirtieth day neutralizing antibody developed with twice the frequency obtained with the first schedule. Similar results were obtained in a small group of persons who received three intracutaneous injections of 0.1 cc. each of vaccine over a period of a month. A recall dose of vaccine administered subcutaneously to 8 persons one year after vaccination elicited a significant rise in neutralizing antibody in 5 cases. A recall dose of 0.1 cc. injected intradermally into another group of 8 previously vaccinated persons resulted in a decided rise in the serum neutralization index of all 8.

Mycosis Fungoides Responding to Antimony Preparation.—Garb presents the case of a woman, aged 49, who had histologically confirmed lesions of mycosis fungoides in the tumor stage. She was given ten intravenous injections of antimony and potassium tartrate and these were followed by thirty-two intramuscular injections of "stibanose" (diethylaminoethenal salt of sodium antimony gluconate). Soon after this treatment began the lesions showed improvement. After seven months of treatment in the course of which 2.8 Gm. of antimony had been given only a few isolated lesions remained. No new lesions developed during treatment. Since the presentation of this case in October 1947, reports on encouraging results from this treatment in 3 other cases have been received. The author thinks that because of the possible relationship of mycosis fungoides and all the other reticuloendothelioses and hyperplasias and tumors such as Hodgkin's disease, Kaposi's sarcoma, lymphosarcoma, leukemias and parapsoriasis en plaques, the experimental therapeutic use of the antimony preparations in this group of diseases appears to be indicated.

Dorsal Sympathetic Ganglionectomy for Asthma.—Carr and Chandler treated 5 patients (2 men aged 59 and 29, respectively; 1 boy aged 13, and 2 women aged 25 and 32) who had bronchial asthma with intractable symptoms of long duration by dorsal sympathetic ganglionectomy. Bilateral excision of the third and fourth dorsal sympathetic ganglions was performed on 3 patients and bilateral excision of the second, third, fourth and fifth dorsal sympathetic ganglions was done in the remaining 2 cases. Microscopic examination of the removed ganglions gave evidence of toxic or metabolic degeneration. Observations of reduction of bronchial lumens between attacks of asthma suggest that changes in the condition of the bronchial mucosa and its glands are responsible for intermittent attacks of symptoms, rather than contraction and relaxation of smooth muscle. From the evidence presented by several workers it is difficult to believe that the vagus is a simple bronchial constrictor nerve; it seems more likely that the vagus and sympathetic trunks contain both sensory and motor fibers and that normal bronchial tone or normal function of the mucosa and glands depends on a balance between them. Sensitization to adrenin of structures which normally have a sympathetic nerve supply is suggested as a possible explanation for the effects of sympathetic denervation of the lungs in asthma. Postoperative follow-up of the 5 patients for periods from four to ten years reveals that they were enabled to return to useful occupations. They have gained from 10 to 100 pounds (4.5 to 45 Kg.). Only 2 patients have lost a few days from work because of "asthma" within the last year. All patients report a satisfactory response to small amounts of epinephrine when an impending attack is feared. The patients whose operations have been performed the longest (ten years) have progressively shown the greatest improvement.

Acute and Chronic Pulmonary Abscess.—Smith reports that 135 patients with primary pulmonary abscess were admitted to Duke hospital from 1940 to 1945, inclusive. Of the 36 patients with disease of less than four weeks' duration which was treated medically, 5 died, 19 recovered and 12 improved but were transferred to the surgical department for operation. Among the 24 patients treated medically between the fifth and twelfth weeks of their disease, 1 died, 6 recovered and 17 were to undergo surgical operation. After the third month of the disease medical treatment cured only 4 of 75 patients, while 5 died and in 66 the condition remained chronic. The optimum time for medical treatment is during the first four weeks of the disease, and this must be calculated from the onset of the febrile reaction and not from the time the first purulent sputum is produced. Drainage is an essential part of the treatment; medical drainage is accomplished by posture and is frequently improved by periodic bronchoscopic aspiration. Early medical diagnosis of the pneumonic infiltration which precedes the abscess is essential for successful treatment with penicillin, arsenic compounds or streptomycin. Thirty-five of the 135 cases of pulmonary abscess were classified as pyogenic and 100 as fusospirochetal. Sulfonamide treatment was definitely helpful in pulmonary abscess caused by gram-positive cocci; it gave only temporary improvement in the fusospirochetal types of infection but failed to cure; the abscesses became chronic and did not respond to sulfonamide or arsenical drugs or penicillin. For the early incipient stage of the infection penicillin is the drug of choice, and in the chronic cases the patients may improve after penicillin therapy to a point where they are better surgical risks. If the patient is not improving clinically and the abscess is not clearing steadily, as shown in serial roentgenograms, by the end of the fourth to sixth week of the disease, he should be referred to the surgeon for operation. Inadequate early treatment and prolongation of conservative treatment past the best time for surgical intervention are the chief causes for the high mortality from pulmonary abscess.

Sump Drainage in Suprapubic Prostatectomy.—McCrea asserts that postoperative sump drainage is one of the recent refinements which has contributed both to the further lessening of hospitalization following suprapubic prostatectomy and to the comfort of the patient during convalescence. The principle of the sump for postoperative vesical drainage was originally advocated by Stedman, who introduced a motor suction pump. After mentioning other investigators who have used sump drains, the author says that in 1944 he described a drain which was made of stainless steel and was used for positive vesical drainage following prostatectomy. An improvement of the equipment was later described. This paper presents the latest improvements of such equipment and summarizes the end results in 100 consecutive, unselected cases in which sump drainage was used following suprapubic prostatectomy. There were 4 deaths, 3 of which were caused by cardiac disease. The fourth was due to pneumonia. The remaining 96 patients were discharged from the hospital and resumed their usual life. Vesical sump drainage materially shortened postoperative convalescence. In a recent survey it was found that the average postoperative hospital stay was 32.6 days when rubber tube drainage was used. When sump drainage was used, the postoperative hospital stay in uncomplicated cases was usually eleven to thirteen days. The comfort offered to patients by sump drainage is amazing. To be dry and comfortable during convalescence is ideal for the patient and for the nursing staff. There is a reduction in pneumonia and pyelonephritis. In a recent survey of 58 deaths following prostatectomy in which rubber tube drainage was used, mortalities resulting from pyelonephritis were 15.5 per cent. It was also found that pneumonia was responsible for a mortality of 10.3 per cent. In this series there was not a single instance of pyelonephritis and there was but one fatality from pneumonia. The wound heals rapidly by primary intention except for that small area utilized by the sump. The one disadvantage of sump drainage is that a mechanical contrivance must be understood by the nursing staff. Unless the principles of management of this equipment are understood, the use of sump drainage will be attended with dissatisfaction. The advantages of sump drainage far outweigh the disadvantage.

Primary Atypical Pneumonia.—Neely says that although it is now generally agreed that the disease entity known as primary atypical pneumonia is caused by a filtrable virus, the term atypical pneumonia is retained because there are many instances in which the etiologic relationship cannot be definitely established. The disease is known by many other names such as virus pneumonitis, acute influenzal pneumonitis, acute pneumonitis, acute interstitial pneumonitis and bronchopneumonia of unknown etiology. Reviewing the present status of knowledge on this entity, Neely stresses that it is an interstitial pneumonitis which is caused by a filtrable virus. It is not a new disease. The pathology and clinical manifestations were described following the World War 1 and the Civil War. Physical abnormalities in the chest are usually minimal or absent; roentgen examination of the chest is necessary to establish the exact diagnosis. The mortality is low and complications few. Microscopically, the characteristic changes are thickening of the alveolar walls and ulceration of the terminal bronchioles with diffuse mononuclear cellular infiltration. Treatment is entirely symptomatic, and the sulfanilamide drugs and penicillin are of no value, except to prevent secondary invading pyogens.

Q Fever in Southern California.—Seventeen cases of Q fever were observed in Los Angeles County in the spring of 1947. The subsequent observations of 100 additional cases indicated that Q fever is endemic in Southern California. Huebner and others report the recovery of Rickettsia burneti, the causative agent of Q fever, from the raw milk of four widely separated dairies in Los Angeles County. Three laboratories were able to recover the organism: the Q Fever Laboratory, Los Angeles County, Calif.; the National Institute of Health, Bethesda, Md., and the Rocky Mountain Laboratory, Hamilton, Mont. Seven isolations were made from duplicate specimens studied in two of the three laboratories. Specific antibodies for Q fever were demonstrated in the serums of guinea pigs previously inoculated with milk. The failure of such antibodies to appear in uninoculated controls and guinea pigs inoculated with materials other than milk provided evidence against the occurrence of spontaneous infection in the guinea pig colonies Rickettsia-like organisms were cultivated in the yolk sac of fertile hen's eggs from the blood and spleen of guinea pigs inoculated with milk. The cultural, morphologic and tinctorial characteristics of eight such strains were identical with those of R. burneti. Yolk sac antigens prepared from milk strains reacted specifically in the complement fixation test with standard Q fever serums. Serums from California cows and human beings found to contain antibodies for Q fever were tested with antigens prepared from milk strains. Specific reactions occurred in the complement fixation test. While R. burneti was recovered from raw milk, the epidemiologic evidence did not indicate that the drinking of milk was the cause of the majority of cases However, it is a possibility that infected milk may serve as a source of infection to man.

"Pyribenzamine" as Adjunct in Morphine Withdrawal Syndrome.—Kells suggests that the factor responsible for the symptoms of the morphine abstinence syndrome is an antimorphinic substance elaborated by the body during the period of addiction. Tripelennamine hydrochloride ("pyribenzamine hydrochloride" N.N.R.) is believed to neutralize this substance chemically and thereby alleviate the discomfort of the abstinence syndrome. In addicts taking 1 grain (0.06 Gm.) or less of morphine a day administration of tripelennamine in doses of 50 mg. four times a day may be started at once. In those taking larger amounts the tripelennamine is not given until the daily intake of morphine has been reduced by half. The dosage of tripelennamine is continued for three days following the last dose of morphine. Tripelennamine is given during the next two weeks whenever necessary to alleviate the mild withdrawal symptoms. In cases of long addiction such symptoms may continue for two months. The authors report 3 cases in which treatment with tripelennamine was used. They stress that the drug is but one portion of the total therapeutic procedure and is in no sense a substitute for morphine.

Treatment of Peyronie's Disease.—Largely as the result of the reported clinical effectiveness of the tocopherols in the treatment of certain forms of fibrositis, such as Dupuytren's contracture, Scott and Scardino were prompted to try these substances in the treatment of Peyronie's disease. This disease is known also as plastic induration of the penis or chronic cavernositis. Since January 1947 the authors have treated 23 patients with Peyronie's disease at the Brady Urological Institute. These patients have been observed monthly for five to nine months. Treatment has consisted of the oral administration of a total daily dose of 300 mg. of mixed tocopherols in three divided doses or 200 mg. of synthetic alpha-tocopherol in two divided doses. Penile curvature was present in 20 of the 23 cases. Pain on erection occurred in 12 cases, loss of potentia in 16 and loss of libido in 4. Six patients had complaints referable to Dupuytren's contracture. Like Dupuytren's contracture, Peyronie's disease usually manifests itself first during the latter part of the fourth and early part of the fifth decade. Complete disappearance of curvature was noted in 4 cases, a considerable decrease in 4, a moderate decrease in 10 and no change in 2. Pain disappeared in all the 12 instances in which it had been present. Softening and a decrease in the size of the penile plaque was described as great in 6 cases, moderate in 15 and unchanged in 2. In the 6 patients with Dupuytren's contracture, improvement was observed in 4 cases and no change in 2. The authors recognize that in an occasional instance Peyronie's disease improves without treatment, but they believe that their results with tocopherol therapy cannot be explained on the basis of spontaneous improvement and that continued use of these substances is indicated.

*Studies on Synthetic Antimalarial Drugs: XIX. Effect of Therapeutic Courses of Paludrine on Relapse Rate of Vivax Malaria. W. H. H. Andrews, D. Gall and B. G. Maegraith.-p. 375.

Synthetic Antimalarial Drugs.—The relapse rate of vivax malaria after treatment of patients with certain antimalarial drugs is discussed. Comparison is made between effects of a standard quinacrine therapeutic course and of two different dosage regimens of "paludrine" (chlorguanide hydrochloride) on the relapse rate of vivax malaria. Significant difference was not observed. Effects of single therapeutic doses of "paludrine" followed by one weekly dose for six months are described. Relapse rate of vivax malaria after this treatment was significantly less than with other therapeutic regimens.

Diffuse Mesodermal Pigmentation with Congenital Cranial Abnormality. Alice Carleton and Rosemary Biggs. -p. 10.
*Skin Sensitivity to Penicillin Preparations. R.H. Meara. -p. 14.

Skin Sensitivity to Penicillin Preparations.—The 3 cases of skin sensitivity to penicillin preparations reported by Meara illustrate the importance of analyzing reaction to the application of compounds. In 1 case the cutaneous condition was caused by the application of penicillin ointment; in 2 cases exacerbations of fairly longstanding exogenous conditions of the skin were caused by the application of penicillin cream. In all 3 cases penicillin as such was found not to be the noxa concerned. In case 1, skin sensitivity to penicillin existed only when the drug was incorporated in the cream base. In cases 2 and 3 penicillin was not concerned at all, the responsible agents being wool alcohols (sterols) and chlorocresol, respectively.

Smallpox in Staffordshire.—Smith describes an outbreak of smallpox which originated with a soldier who travelled from India by air. Several days after reaching home a modified attack of variola developed which was regarded as chicken pox. Of the 30 confirmed cases which developed subsequently, 15 were severe and there were 6 deaths—5 from hemorrhagic smallpox and 1, an unvaccinated confluent case. Vaccination was offered to all known contacts. No endeavor was made to advocate mass vaccination. The public, in panic at the continued incidence of cases, demanded vaccination. More than half the population of the town was vaccinated. Vaccination did not fully protect within the first week of the vaccination period. Many contacts were apparently vaccinated too late in the incubation period. Confluent cases occurred in persons in whom successful vaccination had been carried out nine and eight days before the appearance of the true smallpox rash; in 1 fatal hemorrhagic case successful revaccination of the patient had been carried out twelve days previously. Modified cases occurred where vaccination had been carried out twelve days before the rash appeared. Many persons vaccinated in the military services during the recent war years gave nonimmune reactions.

Superior Mesenteric Arterial Occlusion.—Hendry comments on etiologic and pathologic aspects of superior mesenteric arterial occlusion and presents the history of a man, aged 64, who submitted to surgical intervention because of repeated vomiting of fecal smelling material and tenderness of the abdomen. Laparotomy disclosed 2 to 3 pints (946 to 1,419 cc.) of blood-stained free fluid. In the upper part of the abdomen two loops of jejunum were engorged and contracted; the mesentery was grossly edematous up to the border of the intestine. The bowel showed hemorrhagic infarction and seemed still viable. The abdomen was closed without intervention. Continuous gastric suction was started and fluids were given by mouth. Intravenous dextrose-saline solution was given to attain rehydration. In addition intravenous heparin (50 mg.) was given every five hours for five days. Convalescence was uninterrupted. In retrospect, it was believed that diagnosis could have been made on the basis of the profound shock, partial intestinal obstruction with repeated and progressive vomiting but with good peristalsis and an adequate result from two enemas, and peritoneal irritation evidenced by rebound tenderness and the presence of free fluid. There is little doubt that the shock was due to the escape from the circulating blood of a large quantity of plasma by transudation from damaged intestinal and mesenteric capillaries. Shock and blood-stained intraperitoneal fluid are common observations in these cases.

*Thrombophebitis in Pregnancy. G. D. Matthew. -p. 641.
Blood Changes in the Aged. O. Olbrich. -p. 649

Thrombophlebitis in Pregnancy.—Matthew says that the location of veins involved by thrombophlebitis is essentially the same in obstetric and nonobstetric patients with the exception of the deep pelvic veins. In the recently delivered woman the pelvic veins are apt to be the site of involvement. At the end of labor the large venous sinuses of the uterus, and particularly of the placental site, are obliterated by blood clot and if infection occurs, especially by anaerobic streptococci, a process of septic thrombophlebitis is initiated which may spread through the wall of the uterus to involve the ovarian and uterine veins. In this way there is established a deep pelvic thrombophlebitis, a condition which is not always clinically obvious and thus may account for some cases of apparently unaccountable pulmonary embolism. By further extension the thrombotic process may come to involve the internal iliac and common iliac veins and even the inferior vena cava. Moreover, either by an advancing periphlebitis or possibly by spread along the venous wall, the external iliac and femoral veins may be the site of continuous or isolated areas of thrombophlebitis. Pulmonary embolism, fatal or nonfatal, may occur either before or after thrombophlebitis manifests itself clinically. In the 17 fatal cases which occurred in the Simpson Maternity Pavillion during the past twenty years only 7 showed clinical evidence of thrombosis affecting the veins of the pelvis or lower limbs. Treatment with heparin is discussed, but the author finds it difficult to draw definite conclusions. Objectives of heparin therapy are the immediate control of the local thrombosis, prevention of local spread, prevention of recurrence in the original site or elsewhere, and prevention of pulmonary embolism. These objectives were satisfied in all but 2 cases. In both of these embolism occurred, in one after premature interruption of treatment and in the other after an insufficient drug supply made a full course of treatment impossible. Treatment with heparin reduced the period of hospitalization on the average by one week.

*Progressive Postoperative Gangrene of Skin: Observations on Etiology and Treatment in 2 Cases. A. Lyall and R.D. Stuart. -p. 1.

Course of Bronchiectasis in Children. F.J. Ford. -p. 19.

Clinical Memoranda: Asthma in Child Precipitated by Carbohydrate Dyspepsia. A. Brown. -p. 33.

Postoperative Gangrene.—According to Lyall and Stuart, progressive postoperative gangrene of the skin is the name given by Brewer and Meleney to a slowly spreading gangrenous condition of the skin and subcutaneous tissue arising from an operative wound. The lesion is also commonly termed synergistic gangrene. The authors describe 2 cases of progressive postoperative gangrene. Penicillin was not available when these patients were seen. In both, the lesions failed to respond to sulfonamide drugs or any form of local antiseptic treatment. One patient died, the other recovered after the spreading gangrenous process had been interrupted by repeated surgical guttering. A microaerophilic streptococcus was recovered from the lesions in both patients: in one it was associated with Proteus vulgaris, in the other with Staphylococcus albus initially and later with Staphylococcus aureus. Experiments on guinea pigs and rabbits suggested that each of the three organisms in combination with the associated streptococcus played a synergistic role in the condition. The fact that P. vulgaris has been found to play an intrinsically important part in 1 case of this peculiar form of gangrene suggests that penicillin therapy may be unsuccessful in other similar cases and that adequate surgical intervention along the lines described may then be essential for cure.

*Electroencephalographic Aspects of Infantile Epilepsy. F. Escardó and A. Mosovich. -p. 273.

Electroencephalographic Aspects of Infantile Epilepsy.—Convulsions in infants and children should be considered of epileptic origin unless the contrary is proved by negative electroencephalograms. Escardo and Mosovich obtained electroencephalograms of 8 infants and 42 children and adolescents with either epilepsy or convulsions. The electroencephalograms showed the precise degree of neurologic maturity and neuropsychic organization, the type and origin of convulsions and of convulsive syndromes in infants and children. Persistence of paroxysmal discharges in a definite cortical area in repeated electroencephalograms indicates focal epilepsy. When the discharges come from a given cortical region and follow a movement of cortical propagation they indicate jacksonian epilepsy, which is infrequent in children. The electroencephalographic aspects of nonfocal epilepsy are those showing discharges of rapid frequency in grand mal, of slow frequency in psychomotor epilepsy, of slow and rapid frequency in alternation in petit mal epilepsy and its varied forms, and a combination of tracings of the first and last types when grand mal and petit mal coexist. Electroencephalograms of the first three types call for (1) "epamin" (diphenylhydantoin sodium) and phenobarbital treatment, (2) "epamin" and (3) "tridione" (trimethadione), whereas those showing coexistence of grand mal and petit mal call for combined treatment with drugs indicated for each constituent type of epilepsy. Repeated electroencephalograms are also of value in the differential etiologic diagnosis of several convulsive syndromes in infants and children, especially febrile and nonfebrile convulsions, the so-called infantile eclampsia, the psychic and neurosympathetic forms of epilepsy, disorders of conduct, fainting and spasms. In the cases reported by the authors the electroencephalogram confirmed the clinical diagnosis in 32 cases, clarified the diagnosis in 24 cases and refuted it in 2 cases. The prognosis as to results to be expected from treatment and future behavior of patients in school is good when discharges occur as well organized, regular tracings but poor when they occur as disorganized, irregular tracings.

Intra-Arterial Administration of Sulfonamide Compounds. G. Jorns. -p. 625.
Question Whether Tannin Treatment Has a Damaging Effect on Burns. P. Ollinger. -p. 629.
Blockade of Sympathetic Nerve in Acute Disturbances of Circulation of Blood. W. Block. -p. 635.

Intra-Arterial Administration of Sulfonamide Compounds.—According to Jorns, satisfactory chemotherapeutic result in bacterial infection of wounds is not always obtained by local administration of sulfonamide compounds. Advancing suppuration calls for oral or parenteral administration of these drugs. The advantages of both methods of administration are combined in the intra-arterial administration of the sulfonamide drugs provided that the method is limited to the vessels which supply the involved area. Intra-arterial administration carries the drug directly to the focus of the infection in high concentration. Untoward reactions can be prevented, since an effective level of the sulfonamide agent in the total blood can be obtained with smaller doses than those required for oral administration. Repeated intra-arterial injections at short intervals are indicated because of the brief duration of the high concentration. At first the author used sulfathiazole which had been slightly acidified according to the method of Brunner. Later he used another preparation without any addition. Injections of even 50 per cent solutions were tolerated without reaction. They proved surprisingly effective in severe suppuration of bones or soft tissue of the upper and lower extremities which could not be controlled previously in spite of adequate therapy.

*New Flocculation Test of Blood Serum in Pulmonary Tuberculosis. (Preliminary Note). G. Di Maria—p. 94.

New Flocculation Test in Pulmonary Tuberculosis.—The test reported by the author is simple, quick and extremely sensitive. It is positive in 95 per cent of cases of pulmonary tuberculosis. Four cubic centimeters of blood is withdrawn from a fasting patient into a syringe containing 0.2 cc. of a 2 per cent sodium citrate solution. The contents are mixed and centrifuged. Mercury sublimate, 0.7 cc. of a 1 per cent solution and 0.3 cc. of 95 per cent alcohol are thoroughly mixed in a graduate 1 cm. in diameter. Then 0.04 cc. of the patient's serum is measured with a pipet of 0.1 cc. capacity and added to the mixture in the graduate. The open end of the graduate is covered with the fleshy tip of the finger, turned upside down and the results observed, preferably in day light. Immediate flocculation, either abundant or moderate, indicates pulmonary tuberculosis, respectively acute or subacute; acute or subacute turbidity is followed by flocculation in all cases. If flocculation occurs within the first 5 minutes in the course of the test it indicates active pulmonary tuberculosis. Flocculation after the first 10 minutes of the test has no diagnostic significance. It occurs in the blood serum of normal persons and in that of persons with well healed lesions of pulmonary tuberculosis. Turbid and hemolyzed blood serums should not be used for the test.

*Result of Bronchoscopic and Bronchographic Examination of 128 Patients with Positive Sputum. C. Dijkstra, C. Enneking and J. Struycken Jr. -p. 3742.
Paranephritic Infection Cured by Treatment with Penicillin. H. Deenstra. -p. 3749.

Bronchoscopic Examination of Tuberculous Patients with Positive Sputum.—Dijkstra and his co-workers performed bronchoscopic examinations on 128 tuberculous patients whose sputum was positive for Mycobacterium tuberculosis. They observed that half of them had specific changes such as tubercles, granulations, caseous deposits or polyp formations in the large bronchi. Another 25 per cent had only hyperemia and swelling. Incidence and type of changes were about the same whether tuberculous cavities were present or not. The use of an enlargement lens is important in the evaluation of the results of bronchoscopic examination.

Congenital Heart Defect with Cyanosis: Surgical Treatment. P. Sandblom. -p. 2560.
*Occurrence of Retinal Eye Complications in Diabetes. I. Möllerström. -p. 2571.

Streptomycin in Miliary Tuberculosis and in Tuberculous Meningitis.—In 4 cases of tuberculous meningitis treated with streptomycin the patients are clinically free from symptoms one to five months after the onset of meningitis. In 3 cases treatment was begun within two days of onset, in 1, nine days after onset. In all cases a vestibular disturbance occurred. In 1 instance this receded. Lichtenstein states that a long observation period is necessary because of the danger of late recurrence. The effect of streptomycin seems to be only bacteriostatic. In his first case the tuberculous meningitis appeared five weeks after the cessation of streptomycin therapy of a typical miliary tuberculosis which seemed to have healed, in another case, during streptomycin treatment of pulmonary tuberculosis. Toxic by-effects of streptomycin are seen especially on the acoustic and vestibular nerves. The significance of dosage and duration of treatment in the origin of toxic injuries and the extent to which they are reversible are not yet known. A purer streptomycin or a new related but less toxic antibiotic must be sought.

Occurrence of Retinal Eye Complications in Diabetes.—Möllerström states that retinopathy in diabetes is characterized by retinal hemorrhages and more or less extensive white foci. In grave cases proliferating processes occur. Examination of 2,166 diabetic patients revealed retinopathy in 112. The cause of diabetic retinitis is not yet known. Insulin treatment is no protection. Invalidizing reduction of vision and occasionally blindness can result. To combat and prevent retinal changes is at present an urgent problem in the care of diabetic patients. Diabetes retinitis may be seen in patients aged between 15 and 20, but in most cases appears at a later age. It occurs more often in patients with increased blood pressure and in those without ketonuria. Its increased frequency is thought to depend on the longer life of diabetic patients today, which allows time for the retinitis to develop.

*Treatment of Puerperal Mastitis with Penicillin. W. Neuweiler. -p. 21.
Chemistry in Study of Life. P. Favarger. -p. 23.
*Toxic Effects of Streptomycin on Inner Ear. A. Montandon and B. Camenisch. -p. 28.

Penicillin in Puerperal Mastitis.—Neuweiler treated women who had puerperal mastitis, with or without formation of an abscess, by intramammary injections with penicillin. Fifty thousand to 80,000 Oxford units of crystalline sodium penicillin in 10 to 20 cc. of isotonic solution of sodium chloride were injected around the focus of inflammation; a few cubic centimeters of the solution were injected directly into the infiltrated area. In cases with formation of abscess, the abscess was emptied by puncture and the cavity of the abscess filled with the penicillin solution. Treatment should be repeated daily for five to seven days. Treatment is almost painless and recovery occurs in a few days with complete restitution and without mutilating scar formation and lacteal fistula. In contrast to the results obtained by local penicillin therapy, intramuscular administration of penicillin is not particularly effective. Penicillin passes into the milk with great difficulty, as was demonstrated by Kästli's test first used for the determination of bacterial growth in streptococcic mastitis in cows. This is the reason for the highly satisfactory results from intramammary injections; they may prevent the occurrence of new growth of bacteria in the tissues due to the necessary disinfection of the lactiferous ducts, which cannot be obtained by the intramuscular route.

Toxic Effects of Streptomycin on Inner Ear.—Montandon and Camenisch report the results of the otologic examination of 10 patients, 6 male and 4 female, between the ages of 11 and 32 years who had been treated with streptomycin for miliary tuberculosis and tuberculous meningitis. The average daily dose of the drug was 3 Gm. given by the intramuscular route; it was reduced to 2 Gm. or even to 1.5 Gm. after eight to ten days of the treatment. Four of the patients were given additional intraspinal injections of 0.10 to 0.25 Gm. streptomycin. The excitability of the labyrinth was diminished in 9 of the patients, and in several of them there was total inexcitability to caloric and rotary stimuli, suggesting grave damage to the vestibular passages in the absence of nystagmus or other manifestations of disturbance of the posterior labyrinths. There was a definite relation between the dose of the drug and the intensity of its vestibular effects: only mild disturbance or none resulted from the administration of doses of 2 Gm.; in several instances bilateral total areflexia to caloric and rotary stimuli corresponded with medium doses of 3 Gm., and complete paralysis of the two posterior labyrinths occurred in 1 case. In another case normal vestibular reactions were demonstrated by caloric and rotary tests before the initiation of the treatment, while postrotary hyporeflexia with crossed dysreflexia of Barré type was observed four months later when treatment was terminated. These observations on a small scale confirm those on a larger one by Fowler at the Presbyterian Hospital in New York. Streptomycin seems to exert a damaging effect on the cochleovestibular apparatus and primarily on the vestibular nerve. The average daily dose of 3 Gm. of the drug by intramuscular route seems to be near the limit of toxicity with regard to the central nervous system, and the intraspinal doses of 0.25 Gm. may be even more harmful. Complete and careful examination of the audition and of the function of the labyrinth should be performed before and after each dose of 3 Gm. with streptomycin.

*Not Manifest Dystrophias; Alimentary Deficiencies and Disturbances of Hematopoiesis. (Clinical and Experimental Facts). G. Mouriquand, Mrs. V. Edel, K. Chmelo and J. Zathurecky. -p. 73.
Effect of BAL (British Anti-Lewisite) on Accidents Associated with Arsenic and Gold Treatment. C. Huriez, R. Merville, A. Taquet and B. Steenhouwer. -p. 74.
Medical Treatment of Abscess of Lung. R. Benda. -p. 75.

Disturbances of Hematopoiesis from Alimentary Deficiencies.—According to Mouriquand and his coworkers, often but not always hematologic disturbances may become manifest because of alimentary deficiencies. On the contrary, medullary disturbances or lesions may result nearly always from prolonged alimentary deficiencies (not only from ascorbic acid avitaminosis but from complex alimentary deficiencies). These disturbances of bone marrow may not become manifest, except for the intervention of "revealing factors." Only a transitory deviation from the normal number of red blood corpuscles resulted in normal guinea pigs from repeated blood-letting by cardiac puncture (two to four punctures at intervals of eight to ten days) Anisocytosis, anisochromia and an occurrence of erythroblasts in the blood in addition to fairly pronounced anemia resulted from repeated blood-letting in guinea pigs which were placed on a diet deficient in ascorbic acid. The same disturbances resulted from repeated blood-letting in rats which were placed exclusively on a buttermilk diet. Rats on a varied and balanced diet tolerated the repeated blood-letting well. Clinical experiences were confirmed by these experiments. Patients with alimentary deficiencies should be placed on a balanced diet rich in proteins, and treatment should consist in the administration of iron, folic acid and ascorbic acid in order to prevent severe disturbances of the blood. It should be remembered that prolonged treatment is required for restoration of the bone marrow to normal.

*Repercussions of Gastric Resection for Ulcers on Formed Elements of Blood. G. Faller and J. Kuhlmann. -p. 385.
Evaluation of Terrain in Pulmonary Tuberculosis. P. Weiller. -p. 387.

Effect of Resection for Gastric Ulcer on Blood.—Faller and Kuhlmann say that although it has been charged that gastric resection may result in pernicious anemia, they themselves have never observed this form of anemia after resection for gastric ulcer. In order to obtain information about the late effects of gastric resection on the blood, they made follow-up studies on patients who were operated on between 1935 and 1940. The resections usually involved from three fifths to three fourths of the stomach. Follow-up examinations were made on 53 patients. In about half of this number a mild anemia was observed. In comparison of the tendency toward anemic states in those who had ulcer of the lesser curvature with those who had pyloroduodenal ulcer, it was found that the tendency was three times greater in the former than in the latter. The anemia observed, however, was never of the pernicious type. The anemias could be effectively counteracted by the administration of iron preparations.

Book Notices

A Manual of Pharmacology and Its Applications to Therapeutics and Toxicology. By Torald Sollmann, M.D. Seventh edition. Cloth. Price, $11.50. Pp. 1132. W. B. Saunders Co., W. Washington Square, Philadelphia 5, 1948.

This book has become well known to student, teacher and practitioner. First copyrighted in 1917, it is a standard teaching and reference book. Unlike some other reference books, it is easily read and has always been filled from one end to the other with meaty information that can be put to practical use. The new edition is completely revised, and the format is changed to make it even more readable. For those who are interested in therapeutics, up-to-date and practical information abounds; for those who are interested in animal experimentation, the book is indispensable. That which is no longer of real importance has been omitted, and that which is new has been included and described so that its full value and limitations are readily apparent. The book can be recommended for every one, including medical students, medical practitioners, pharmacists and nurses, who is interested in any phase of therapeutics. Of course it contains detailed information that is not necessary for pharmacists and nurses, but nevertheless they will find this an excellent reference source. As for physicians, the usefulness of this book can best be expressed by stating that it should be in the library of every medical student and on the desk of every physician.

Human Ancestry from a Genetical Point of View. By R. Ruggles Gates, F.R.S. Cloth. Price, $7.50. Pp. 422, with 36 illustrations. Harvard University Press, Cambridge, Mass., 1948.

The author, who is widely known as a biologist and anthropologist, reviews here the origin and history of the races of mankind throughout the world. He conceives that there have been many divergents from various ancestral stocks. Much of the study has been made at first hand by the author, particularly among the Polynesians and Melanesians. The scholarly character of the study, the excellent bibliography and a comprehensive index make this among the best available books in its field.

The British Encyclopaedia of Medical Practice Including Medicine, Surgery, Obstetrics, Gynaecology and Other Special Subjects. Medical Progress, 1947; Cumulative Supplement, 1947. Editor in Chief: Rt. Hon. Lord Horder, G.C.V.O., M.D., B.Sc., Physician to the King. Fabrikoid. Boards. Pp. 527, with 15 illustrations; 274 with 6 illustrations. Butterworth & Co. (Canada) Ltd., 1367 Danforth Ave., Toronto 6, 1947.

The British Encyclopaedia of Medical Practice keeps its subscribers up to date by the publication of annual volumes and comulative supplements. These are essentially abstracts of important new contributions with occasional reviews of several articles. The books listed here supplement the original twelve volumes.

Stone Walls and Men. By Robert M. Lindner. Cloth. Price, $4. Pp. 496. New York, Odyssey Press, 1946.

The approach to crime from the medical point of view has fascinated many a physician and general reader. The author of this book has taught his subject for some years at Bucknell University, Lewisburg, Pa. He supplements his text with case reports that are as fascinating as modern novels. His chapters concern such aspects of the subjects as the motivation of crime, psychopathy and crime, juvenile delinquency and life in prison. Dr. Lindner is convinced that there is need for far more study of the individual criminal by the methods of modern psychology and psychiatry than has thus far been applied. His approach to crime from the psychologic and sociologic points of view and what he has learned from this approach offer opportunity for application by the responsible authorities.

Prophet in the Wilderness: The Story of Albert Schweitzer. By Hermann Hagedorn. Cloth. Price, $3. Pp. 221, with portrait. The Macmillan Co., 60 Fifth Ave., New York 11, 1947.

Albert Schweitzer: *An Anthology.* Edited by Charles R. Joy. Cloth. Price, $3.75. Pp. 323. Harper & Brothers, 49 E. Thirty-Third St., New York 16; the Beacon Press, Inc., 25 Beacon St., Boston 8, 1947.

Suddenly the story of Albert Schweitzer has achieved worldwide interest. Recent publications include this brief biography and this collection of quotations from his various writings, as well as other works of comment. Schweitzer is unquestionably one of the great minds of our times. His contributions to philosophy, to music and the arts, and his work in a great medical center which he established among the natives of French Equatorial Africa are contributions that demand respect and admiration.

The Neocortex of Macaca *mulatta*. By Gerhardt von Bonin and Percival Bailey. Illinois Monographs in the Medical Sciences. Vol. V, no. 4. Published by the University of Illinois, under the auspices of the Graduate School. Paper. Price, $3. Pp. 163, with 102 illustrations. The University of Illinois Press, Urbana, Ill. 1947.

This is, to date, the only thorough study of the cortex of the most commonly used primate. It has a prologue, seven autonomous chapters and an epilogue. It is written in good prose, with a happy choice of words, preserving familiar terms without loss of precision. Its ninety pages of text include about fourteen pages of tables and clear line drawings schematizing the growth, size and proportion of the brain, its fissural pattern, thickness of layers, survey by serial sections, partial maps by sundry authors and diagrams of interconnections. The frontispiece, in color, conveys the distribution of distinguishable architectural areas and by its tinting suggests how these merge into one another. There is a carefully selected bibliography of some one hundred and fifty entries. But the most important portion of the volume is, as the authors' state, a set of sixty-two collotype plates, each at a magnification of 100 diameters, of a section 20 microns thick, cut practically perpendicular to the surface of the cortex at a place indicated exactly in the figures. Even to the untrained eye these Nissl stains show the resemblance of each cortical area of the monkey's brain to the same area of man's brain as depicted by von Economo, whose terminology the authors have therefore employed. The book will be most useful to those engaged in experimental work on the cortex, who wish to draw conclusions concerning man from observations on Macaca mulatta. As it is likely to remain the standard text for many years, we are particularly indebted to the authors for an anatomy that is fun to read, and to the University of Illinois Press for a volume that is a pleasure to see.

History of the Medical Society of the District of Columbia. Part II, 1833-1944. History Committee: John Benjamin Nichols, Chairman, William Johnston Mallory and Joseph Stiles Wall. Cloth. Price, $5. Pp. 357, with 14 illustrations. The Medical Society of the District of Columbia. 1718 M St., N.W., Washington 6, D. C., 1947.

A volume of five hundred and one pages published in 1909 traced the history of this distinguished medical society from 1817 to 1909. The present volume offers a continuation until recent times and supplements some of the earlier materials. In 1911 the Medical Society of the District of Columbia and the Medical Association of the District of Columbia amalgamated. There are chapters about the contribution to World War I, economic problems and records of the officers of the society and its publications, as well as a complete record of membership.

The Impact of a Children's Story on Mothers and Children. By Martha Wolfenstein. Monographs of the Society for Research in Child Development, Serial No. 42, Volume XI, 1946, No. 1. Paper. Pp. 54. Society for Research in Child Development, National Research Council, 2101 Constitution Ave., Washington 25, D. C., 1947.

Among the newer psychologic technics is work of the type exemplified by this study. The story concerned the birth of a second child in the family. It was tested on 10 children aged 4 years—5 boys and 5 girls—with their mothers. The reactions of the child and the mother were then reported and studied. The study indicated that resistances against the story developed in the mothers and transmitted themselves to the children, which made possible rewriting of the story to meet the needs. Conflicts were apparently created in the children, and other important psychologic observations were also made.

The Contemporary American Family. By Ernest R. Groves and Gladys Hoagland Groves. [New edition of The American Family.] Cloth. Price, $4 50. Pp. 939. J.B. Lippincott Co., 227-231 S. Sixth St., Philadelphia 5, 1947.

This book is a completely rewritten and reset edition of the book published by the authors in 1934 under the title "The American Family." It has become one of the most important reference works in the field that it concerns and is at the same time a most useful textbook in courses in sociology. The authors adopt the point of view that frigidity in the female is due in most instances to poor sex technic of the husband. There is rather too much of simplicity in this and in other medical aspects of the book. The volume is supplemented with a comprehensive bibliography and index.

The Parathyroid Glands and Skeleton in Renal Disease. By J. R. Gilmour, M.R.C.P., Pathologist in Emergency Medical Service; Junior Assistant Director, Bernhard Baron Institute of Pathology, London Hospital, London. Oxford Medical Publications. Cloth. Price, $5 75. Pp. 157, with 25 illustrations. Oxford University Press, 114 Fifth Ave., New York 11; Amen House, Warwick Square, London, E.C. 4, England, 1947.

The monograph based on the study and analysis of 60 unselected cases and 30 selected cases of renal disease deals with the description of and correlation between the histologic and other changes of the kidneys, parathyroid glands and bones. The renal diseases are divided for this purpose into three main classes: primary toxic nephritis, symptomatic toxic nephritis and other renal diseases. Each of the first two classes has several subdivisions. Cases of ischemic nephritis of vascular origin (benign hypertension) are excluded because abnormal enlargements or histologic changes in the parathyroids were not found with these conditions. Macroscopic and microscopic criteria are used to divide the parathyroid glands examined into six types. After recording the methods of standardization and the various standards used, Gilmour discusses the relation of parathyroid weights, their texture and color, and their histologic and cytologic features to urea retention, plasma phosphorus, blood pressure, heart weight, duration and type of renal disease and degree of renal destruction. The coexistence and significance of renal disease secondary to von Recklinghausen's disease as well as a brief review of the literature on parathyroid changes in renal disease are given. Then follow a detailed description and an analysis of the histologic bony changes (osteitis fibrosa) and renal rickets. After a brief discussion of metastatic calcification and calcinosis in relation to renal, parathyroidal and osseous reactions. There follows a chapter on calcium and phosphorus metabolism in their relation to renal rickets. metastatic calcification and calcinosis. In concluding paragraphs the problem of the cause of parathyroid and skeletal changes in renal disease of both adults and children is considered the proximate or immediate cause of the parathyroid hyperplasia, hyperphosphatemia by reduction of blood calcium being the remote cause. An appendix brings a summary of the 90 cases analyzed. The monograph represents a great amount of detailed and painstaking work, which will be appreciated mainly by the pathologist, but which should be useful study material for the clinician. Tabulation of the various standards employed would have helped the reader in understanding more readily the text. The bibliography is representative but not exhaustive

Illustrative Electrocardiography. By Julius Burstein, A.B., M.D., Visiting Electrocardiographer and Chief of the Cardiac Clinic, Morrisania City Hospital, New York, and Nathan Bloom, M.D., F.A. C.P., Associate Professor of Medicine and Chief of the Department of Electrocardiography, Medical College of Virginia, Richmond, Va. Third edition. Fabrikoid. Price, $6. Pp. 309, with 99 plates. D. Appleton-Century Co., 35 W. Thirty-Second St., New York 1, 1948.

The third edition with a new co-author is a complete revision of the text and illustrations, only two of the illustrations of the preceding edition having been retained. The clumsy size of the preceding edition has been replaced by a more conventional size. The book consists mainly of illustrations with explanatory text and some supplementary textual material. Essentially it contains chapters on the fundamentals of electrocardiography, the arrhythmias and electrocardiographic contour. Chapters on phonocardiography and cardiac roentgenology are included. The authors' statement in the preface that this edition takes the specialist through the entire field of electrocardiography is not adequately fulfilled. The book is suited only for the medical student and the beginner in electrocardiography, and even for them it is only fair. The illustrations are for the most part typical. The chapters on phonocardiography and roentgenology are superficial and contribute little even to a beginner. The discussion of the normal electrocardiogram is inadequate. The authors use only one chest lead in their illustrations, either IV_F or IV_R. The present recommendation of the American Heart Association Committee is for three chest leads, and the apex lead is not recommended. The section on multiple precordial leads covers less than a page and is totally inadequate. The comments on the unipolar leads are also superficial.

The best that can be said for this book is that the beginner may enjoy looking at some of the typical illustrations. Certainly no one past that stage would find this book useful or worth while. Even for the beginner, other texts are available which he will find far more useful

Treatment of Some Chronic and "Incurable" Diseases. By A. T. Todd, O. B. E., M.B., M.R.C.P. Second edition. Cloth. Price, $7. Pp. 324. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1947.

The basic premises of Dr. Todd, as stated in the introduction, are sound and stimulating, but his application of these concepts in later chapters is confused and at variance with modern medical knowledge. One is pleased with the author's introductory emphasis that no disease exists as an isolated entity in a single organ or structure; that when one system is affected all others are involved to a greater or lesser extent. The unity of the patient as a basis for therapy, rather than treatment of a disease, is sound clinical thinking. Likewise welcome are the author's insistence on recognition of multiple etiologic factors and his protest against oversimplification of etiologic analysis by continuation of the inadequate idea of specific and single causation.

So far so good. But the elaboration of these ideas as applied to the therapy of the various chronic disorders, such as diabetes mellitus, epilepsy, postencephalitic parkinsonism, arterial hypertension, constipation and cancer is vague, faddish and at times irrational. In avoiding excessive specificity Dr. Todd tends to revert to the old and now largely discarded philosophy of gunshot prescribing. For example, the suggested management of chronic hyperthyroidism includes cortical hormone, high carbohydrate diet, radiation of the thyroid and fluoride salts to "depress hepatic glycogenolysis." No mention whatever is made of thiouracil or its derivatives. Arterial hypertension is stated to be due largely to alimentary dysfunction and defective venous return. It is to be cured with deep breathing exercises, a low fat diet and bitter carminatives! Would that it were so simple. Furthermore, a number of previously secret lead, selenium and sulfur colloidal suspensions are recommended for intravenous administration in the treatment of cancer and the arthritides. The book is a curious mixture of sense and nonsense; sound thinking is overlaid with illogical faddism and downright wishful thinking. It makes entertaining and sometimes amusing reading for the critical reader but, like Dr. Todd's other recent book, "Medical Aspects of Growing Old" (*J.A.M.A.* 135: 433 [Nov. 15] 1947), it is so unsound that it cannot be recommended.

Radio Manual: A Guide to Broadcasting for Mouth Health Education. "Prevention Through Education." Cloth. Price, $4. Pp. 320. Oral Hygiene Committee of Greater New York, 111 E. 56th St., New York 22, 1947.

This book is a collection of radio scripts used in the broadcasting program of the Oral Hygiene Committee of Greater New York, together with a history of the committee and a listing of its component organizations plus a section of the radio broadcasting of mouth health information. Within the narrow limitations of the subject, the broadcasts have achieved rather remarkable variety and interest in the scripts presented. Many of them, however, fail in the fundamental requirement of radio broadcasting, mainly, the necessity of broadcasting to the listener rather than merely at and for him. Information about the American Dental Association is undoubtedly important and of great interest to dentists, but it tends to leave the lay listener indifferent and disposed to tune out the program. In a number of the scripts the information is largely what the dentist would like the patient to know rather than what the patient would like the dentist to tell him.

Doctor Freud: An Analysis and a Warning. By Emil Ludwig. Cloth. Price, $3. Pp. 317. Hellman, Williams & Co., 5 Beekman St., New York 7, 1947.

In this biography Mr. Ludwig is entirely out of his field. What he has produced is not a competent biography but a parade of uninformed prejudices. Compared with other recent works that attempt to present an adequate consideration of Freud's contribution to modern psychiatry and psychology, this book is infantile.

The Endeavour of Jean Fernel with a List of the Editions of His Writings. By Sir Charles Sherrington, O.M. Cloth. Price, $3.50. Pp. 223, with 27 illustrations. Cambridge: at the University Press; New York: the Macmillan Company, 1946.

The name Jean Fernel has a high place in medical science. This book owes its quality not only to the greatness of the subject but also to the fact that the writer is no less an authority than Sir Charles Sherrington. The book is a fine biographic evaluation supplemented by side discourses on other great persons of the period and by adequate biographic references.

The Conduct of Life Assurance Examinations. By E. M. Brockbank, M.B.E., M.D., F.R.C.P. The General Practice Series. Second edition. Cloth Price, 12s. 6d. Pp. 176. H. K. Lewis & Co., Ltd., 136 Gower St., London, W. C. 1, 1947.

Although prepared by a British author primarily for British readers, this book should be of real interest and value to general practitioners in the United States. Physicians specializing in life insurance examinations or in industrial medicine will find many helpful suggestions, based on the wide experience of the author in this particular field. This edition covers the more recent advances in life insurance work with new material and tables on tuberculosis and cancer risks, glycosuria, blood pressure and expectation of life. The text is divided into two sections, the first of which deals with the routine examination and completion of the medical report form, while the second section suggests some of the guiding principles in the examination and possible acceptance of so-called "impaired lives," or substandard risks.

The author is an authority on the heart and cardiovascular system in general. Another book of his, "Diagnosis and Treatment of Heart Disease," already has appeared in a sixth edition. It is not surprising, therefore, that the chapters on the cardiovascular system in his book on life insurance medical examinations are among the most valuable and significant. The book has a well organized table of contents covering all twenty-six chapters of the two sections, a brief list of general references and an index of subjects. Although a few minor typographic errors are present in the text, the material on the whole is well prepared and printed.

The Gifted Child Grows Up: Twenty-Five Years' Follow-Up of a Superior Group. By Lewis M. Terman and Melita H. Oden, in association with Nancy Bayley, Helen Marshall, Quinn McNemar and Ellen B. Sullivan. Volume IV, Genetic Studies of Genius. Edited by Lewis M. Terman. Cloth. Price, $6. Pp. 448. Stanford University Press, Stanford, Calif.; Oxford University Press, Amen House, Warwick Square; London, E. C. 4, England, 1947.

This is the fourth volume in Professor Terman's magnificent study of the gifted child that has now moved into a second generation. He follows his children with high intelligence quotients into their occupations, their family life and their social and political attitudes. In the field of study comprehended by this work, there is no more important research.

Chronic Structural Low Backache Due to Low-Back Structural Derangement. By R.A. Roberts, B. Sc., M.B., Ch. B. Cloth. Price, 45s. Pp. 105, with 137 illustrations. H.K. Lewis & Co., Ltd., 136 Gower St., London, W.C. 1, 1947.

This book represents keen observations and intensive study on a subject that involves a small, though important, part of the body. The author discusses spondylolisthesis and its associated pathologic changes, i. e., neurovascular and visceral symptoms and defects of ossification. Since most of the present writings by gynecologists, urologists, abdominal surgeons, internists and psychiatrists pay little attention either to the pain of spinal origin which may simulate visceral pain or to the neurovascular symptoms which can arise through sympathetic nerve irritation by skeletal lesions, the author believes that there is a need for a radical reassessment of differential diagnoses. In the vast majority of these variations in structure, there is little or no consequent weakening of the skeletal architecture.

The pars interarticularis is situated between the superior and inferior articular processes. Laterally it joins the base of the transverse process. It is only on the neural canal aspect that it is continuous with the pedicle and lamina.

In the lumbar spine of the human being it is the narrowest and most delicate part of the neural arch, its cross sectional area being less than that of any other part. A nutrient artery enters either anteriorly or posteriorly. It can be termed the vital pivotal center in the architecture of the vertebra for the interaction of the powerful muscles and ligaments of this region.

Roberts's study began as an attempt to understand more clearly the roentgenologic interpretation of these defects and a search to explain the great discrepancy between the small number diagnosed in the living and the high incidence of over 1 in 20 found anatomically. The author quotes several writers on the research that has been made to explain the defects which are found in the ossification of the pars interarticularis of the vertebrae. Willis reported over 5 per cent of these defects in 1,520 skeletons; Shore 6 per cent in Bantus; Congdon 5 per cent in American aborigines; while Stewart found as many as 25 per cent in Eskimos.

The once popular diagnosis of "toxic sciatic neuritis" included all cases of ruptured intervertebral disk. There is no more justification for suspecting infection in overstrain in the lower part of the back than there is in internal derangement of the knee joint, tennis elbow or march fracture.

The diagnosis of an anxiety state as opposed to the mere presence of anxiety symptoms should be made only when anxiety symptoms are abnormally intense, and above all when they are abnormally persistent....It is wise to exercise caution before diagnosing an anxiety state unless one or all of the following signs are present: pallor, drawn face, dilatation of the pupils, flushing, sweating, tachycardia, fine tremor and consistently brisk reflexes, particularly in the arms.

Detection of the condition is neither difficult nor a sign of shrewdness. One trick in particular is fallacious, that of marking out tender spots and observing whether they change; they frequently change in patients with recognized and accepted lesions.

Two of the most generally mentioned motives are the desire to gain compensation in civilian life and the desire to escape military service. Our accusations against the unfortunate backache might have a boomerang effect, were the patient more aware of things and we not so sheltered by our privileged position. The main purpose of treatment, apart from relieving symptoms, should be to strengthen the vulnerable part of the spinal structure.

Diseases of the Joints and Rheumatism. By Kenneth Stone, D.M., M.R.C.P., Physician, B.R.C.S. Clinic for Rheumatism and Physical Treatment, Kensington. Cloth. Price, $6.50. Pp. 362, with 57 illustrations. Grune & Stratton, 381 Fourth Ave., New York 16, 1947.

The author presents a satisfactory exposition of his subject and adequate coverage of the material. The book is intended for students. The author aims to present a guide to those postgraduate students who intend to engage in the special study and practice of rheumatology. He makes a pertinent statement that efficient clinical investigation is impossible without a foundation of knowledge covering the whole field of articular disorders.

He presents his material in two parts: The first deals with disease of the joints and the second with nonarticular rheumatic diseases. He stresses the point that a painful knee is a different problem from a painful shoulder even though they both are caused by the same pathologic process.

The section on experimental fibrositis is interesting. Although it does not present anything new, it is a practical book and easy to read.

Personality in Handwriting: A Handbook of American Graphology. By Alfred O. Mendel. With a foreword by Rudolph Arnheim, Ph.D. Cloth. Price, $3.50. Pp. 375, with illustrations. Stephen Daye Press, 105 E. 24th St., New York 10, 1947.

As the author states in the foreword, "Graphology offers a dramatic example of the battle for scientific truth. Its students range from the soothsayer in the night club to the experimentalist who measures pen pressure in the laboratory .... At the present stage of graphological affairs an open minded and at the same time critical consideration of all available resources is necessary."

Mendel has produced a lucid, well written, convincing volume which takes graphology out of the realm of mysticism and presents it as a scientific approach to the understanding of human personality. The whole book is so well written and the author's style is so simple and convincing that the reader finds that this is not just a book to be read but one that may be studied with pleasure and profit. Nothing is left to the reader's imagination and the deductions and conclusions reached appear logical and are reinforced with much concrete evidence for their validity. This book is highly recommended reading for any one seriously interested in personality study.

Recent Advances in Sex and Reproductive Physiology. By J. M. Robson, M.D., D.Sc., F.R.S.E., Reader in Pharmacology, Guy's Hospital Medical School, University of London, London. With an introduction by Professor F. A. E. Crew, M.D., D.Sc., F.R.S. Third edition. Fabrikoid. Price, $5.75. Pp. 336, with 65 illustrations. The Blakiston Co., 1012 Walnut St., Philadelphia 5, 1947.

The third issue of this volume is the first to appear in seven years. During this time much has been contributed to the field of sex and reproductive physiology. The author has expertly handled this new material in its relationship with the previously developed knowledge to make a cohesive and homogeneous volume for the benefit of the specialist and student of these subjects. Only an author who has had intimate contact through his own personal researches could manage to prepare an authoritative, readable book without being led astray by the confusing mass of data available in the literature. The author is well qualified to fulfil these requirements.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST

CAUSE OF SUDDEN DEATH

To the Editor:—The following are reports of a patient who dropped dead July 31, 1947 while at work in the mines. He had been employed as a miner for thirty-one years. The coroner's report showed that death was caused by coronary thrombosis (no postmortem examination was performed at this time). His family had an autopsy performed and a roentgenogram taken one day later, reports of which follow:

Body: The body was that of a middle aged man, moderately obese. There was no external evidence of injury or disease. The body had been embalmed. Head: not opened. Thorax-Heart: The heart was distinctly but moderately enlarged. All chambers were *involved in this hypertrophy*, and the relative variation was not great. The valves showed no significant *pathology until* the aortic was reached; there was an extreme degree of distortion, sclerosis and calcification. At that time the clinical lesion was stenosis, but the heart had been embalmed for twenty-four hours. The orifices of the coronary arteries were open, and there was no great damage to the ascending aorta. There was moderate sclerosis throughout both coronaries and the anterior branch of the left coronary contained calcified plaques, but no actual occlusion was seen, nor was there any evidence in the heart muscle. Lungs: Both lungs were tightly adherent to the chest wall and could be freed only with difficulty. The upper lobes were studded with small black fibrotic nodules. On both sides there were large areas of fibrosis and exogenous deposits. A major portion of the lung showed the same black pigmentation. The autopsy observations were in accord with the roentgen diagnosis, that is, a third degree pneumoconiosis (anthracosis). Abdomen: The gastrointestinal tract was negative. The liver and spleen showed no distinct pathologic process. There was no passive congestion of the kidneys, and all the organs showed some excessive fat deposits, but this was by no means extreme. Anatomic diagnosis: The anatomic diagnosis was third degree anthracosilicosis, aortic *stenosis* with cardiac hypertrophy and coronary insufficiency. Acute cardiac failure, the precise mechanism being uncertain, was the cause of death.

The roentgenologic report was as follows: Roentgenologic exposure of the chest made approximately one day after death revealed both pulmonary fields to be collapsed. There appeared to be a third degree pneumonoconiosis throughout the collapsed pulmonary field. The shadow of the heart was not well outlined. What are the probable secondary and primary causes of death? Is the heart condition secondary to the anthracosilicosis in the lungs, and do not the lymphatics cause a precipitation of cholesterol and calcium?

M.D., Pennsylvania.

ANSWER.--This reply is governed by the desire to avoid finite diagnostic conclusions. Major cardiovascular involvement is not a prominent feature of silicosis. The proceedings of the fourth Saranac Laboratory Symposium on Silicosis contains this item: "caution should be exercised in reporting causal relationships between the pulmonary fibrosis and disease of the heart since so many silicotics die in the age periods when disease of the heart and arteries are usual." In the immediate situation no precise proof is furnished that exposure to siliceous dusts occurred, but it is recognized that in the geographic area involved such exposure may have been provided. The record as furnished includes the diagnostic note, "third degree pneumonoconiosis (anthracosis)." It is not granted that any such entity exists, but the term, third degree frequently is associated with silicosis including anthrasilicosis. Roentgen films of completely collapsed lungs after embalming scarcely afford opportunity to distinguish between the several stages of silicosis. In those instances in which cardiac hypertrophy is believed to derive from pulmonary silicosis, expectations are for right-sided preponderance, which appears not to be the case in this instance. Death of this person took place "while at work." Silicosis of such severity as to make death from silicosis a major factor would have been accompanied by manifestations likely to have prevented work. Sudden death from silicosis is not expectable. It appears probable that some degree of silicosis did exist. Any uncertainty concerning this could have been cleared up by *microscopic tissue examination. Even if* the characteristic features of silicosis were established, such evidence in itself provides no assurance that this contributed to the cardiac state or caused the death of the miner. Anthracosis alone is of universal occurrence among miners and commonly represents benign pneumonoconiosis without significance. The record provides inclination to accept cardiovascular disease as the essential item in the cause of death. Any precise influence by the probably coexisting anthrasilicosis is unproved. Any *association on a causal basis may reach into* speculation.

SUBSTERNAL PAIN

To the Editor:--(1) If a smoker with angina on effort with only occasional and mild attacks, and with normal physical, fluoroscopic and electrocardiographic observations stops smoking and his "attacks" disappear entirely, what is his prognosis as far as life expectancy is concerned? Am I right in telling him that his spells were just angiospasms, without organic substratum, and that his prognosis is that of a healthy nonsmoker? What are the statistics relative to this problem? (2) In many cases of occasional mild substernal discomfort without any pathologic signs on the most careful physical, roentgenologic and electrocardiographic examination, I find that the substernal pressure appears only at times and that otherwise the patient may perform any amount of exercise, after a sleepless night and a heavy meal, and yet have no signs of myocardial anoxemia or any subjective complaints. Moreover, some of my patients tell me that in order to find out "how much the heart can take" they perform extremely heavy gymnastics without difficulty. However, one of these patients was told by a prominant consultant that he really has coronary insufficiency: "One discomfort in a year makes the diagnosis certain." He then insisted on another cardiologist, incidentally not less prominent; nevertheless, this time the opinion was as follows: "In case of organic substratum your patient would have always his attacks as soon as the same amount of exertion would be performed in the same conditions (heavy meal, etc.)." Who is right? (3) Are there any proved cases of persons who died from typical coronary attacks with negative anatomic pathologic observations? (4) Is seafood cholesterol-poor?

M.D., New York.

ANSWER.--1. It has long been recognized clinically that there appears to be little causal or temporal relationship between smoking and true angina of effort. Contrarily, there is a more apparent connection between tobacco and functional disorders of the heart associated with atypical chest pain which may radiate to the upper extremities, and, frequently, other constitutional symptoms attributable to the tobacco. Nevertheless, in patients with coronary artery disease the use of tobacco may precipitate or aggravate angina of effort, and abstinence from tobacco may bring about an amelioration of pain. The literature also provides a smaller number of illustrations of the permanent relief of angina of effort following withdrawal of tobacco in patients who were never demonstrated to have coronary artery disease. Many practicing cardiologists in their experience have been impressed by the relief of apparent angina of effort following the contradiction of tobacco. Despite considerable laboratory and clinical investigation attempting to elucidate the mechanism of pain production through tobacco, the subject remains controversial. One or both of these mechanisms, singly or in combination, are thought to be operative (1) the heart is called to perform an increased amount of work because of the elevation of heart rate and blood pressure frequently caused by tobacco The need for coronary flow is therefore augmented, and relative coronary insufficiency ensues (2) Nicotine causes active coronary artery constriction by direct action on the vessels. Other factors thought to be contributory, or even solely responsible, are hyperreactivity of the blood pressure, hypersensitivity to tobacco, a direct toxic effect on the myocardium and the development of active ectopic cardiac arrhythmias.

In direct answer to the question, then, one cannot decide at the present time for or against a substratuum of organic disease. The absence of abnormal objective findings does *not* rule out coronary disease. The age of the patient may be prejudicial in one's thinking The provocative exercise test with the electrocardiogram, if [illegible]nctively abnormal, may provide the answer. [illegible]ise, one can only observe this patient for a [illegible]onger time before coming to a more definite [illegible]lusion. One must maintain a certain amount of mental reservation because of the unpredictable hazards related to coronary artery disease, if existent. What one tells the patient in such dubious diagnostic circumstances depends on one's policy in managing patients, and is to be decided by the attending physician.

2. Not every instance of substernal pain or oppression is the result of myocardial ischemia. Many other conditions must be ruled out. Both of these consultants have an element of correctness. Certainly, one attack of chest pain, if it carries with it enough of the known stigmas, can be ascribed to myocardial ischemia with or without myocardial infarction. In attempting to attribute one attack or recurrent attacks of chest pain to transitory myocardial ischemia, besides the nature and distribution of pain, the knowledge of the relationship of the onset of pain to circumstances

SYPHILIS OF CENTRAL NERVOUS SYSTEM

To the Editor:—Please advise further treatment in the following case: A man aged 45 had a positive blood Wassermann reaction December 1946, without evidence of clinical *syphilis or symptoms* therefrom. The diagnosis was substantiated in a number of laboratories and he was given penicillin. He received eight daily doses, 300,000 units per dose, making a total of 2,400,000 units; the penicillin was discontinued because of a severe generalized eruption with involvement *of* the mucous membrane, as well as the entire skin. The patient was then treated with heavy metals and arsenicals. To date he has taken about thirty-five arsenicals and about a similar number of bismuth injections. His blood Wassermann reaction continues to be strongly positive and the spinal fluid Kolmar reaction is positive with the colloidal gold reading as follows: 55532000. Physical examination and neurologic examination are still negative and the patient feels fine and continues to do heavy work each day. We recently gave him 100,000 units of penicillin in saline solution, which quickly produced a return of all sensitivity reaction. As this patient shows some activity in the central nervous system I should like your opinion as to further treatment. Is it necessary to continue with the present treatment; give him hypertherm treatment; or attempt to desensitize him to penicillin? Is streptomycin effective in syphilis of the central nervous system?

ANSWER—Additional treatment in this case hinges on the degree of activity in the central nervous system, since treatment has otherwise been reasonably adequate and there are no symptoms or signs of syphilis. Prognosis in asymptomatic syphilis of the central nervous system depends on detailed study of the spinal fluid, including cell count and Wassermann, total protein and colloidal tests. Since the results of all these tests are not given the discussion must be general and cannot be specific.

Treatment for syphilis has been definitely inadequate in this case if the involvement of the central nervous system is active. With group 1 spinal fluids (increase in cells to about 10 or 12 lymphocytes, slight increase in protein, weakly positive to negative Wassermann reaction and slight disturbance in the colloidal curve) spontaneous regression may be expected. With group

SEVERE RHEUMATOID SPONDYLITIS

To the Editor:—A severe spasm of the neck muscles accurs in a patient with advanced rheumatoid arthritis. The patient is an Italian woman aged 26 with rheumatoid arthritis involving the spine so that " there is complete bony fusion of the sacroiliac joints and of the apophysial articulations of the lumbar vertebra, but with normal x-ray findings regarding the cervical vertebrae." She has had the disease for five years, has a poker back, has lost 40 pounds (18.1 Kg.) (weighs 96 pounds [43.5 Kg.] now) and has some activity at present, as evidenced by a continuous low grade fever and a sedimentation rate of 50 mm. per hour. There is involvement of knees and fingers in addition to the spine. Her chief disability at present, however, is that the muscles in her neck are in spasm so that she has been unable to move her head in any direction (flexion, extension, rotation or any other motion) more than ½ inch (1.27 cm.) for the past four months. That this is not due to bony ankylosis is demonstrated by the fact that the roentgenograms are normal and that under anesthesia with curare (" intocostrin" N.N.R.) she was completely relaxed and the neck was flail, permitting full motion in all directions. As soon as the curare and anesthetic effects were dissipated the spasm returned and has continued to date. She has been cared for by many arthritis specialists to no avail; I have given her (over a period of time) two courses of gold therapy (a total of 1 Gm. each in divided weekly doses), physical therapy (heat, massage and liniments) acetylsalicylic acid in 30 grain (1.94 Gm.) daily doses, a series of neostigmine injections, nonspecific protein therapy and several injections of curare in an attempt to break the torticollis. She has also had general care with vitamins, proteins and iron. A course of roentgen therapy gave some benefit with regard to pain but no relief from this resistant spasm. Any suggestions will be deeply appreciated.

Franklin F. Ham, M.D., Van Nuys, Calif.

ANSWER.—Fortunately in many cases of rheumatoid spondylitis the disease affects the sacroiliac joints and apophysial joints and ligaments of the lumbar and thoracic region and " burns out" before affecting the neck. However, in some cases various structures of the neck also are affected: paravertebral joints ("facets"); paravertebral ligaments and muscles. Muscular involvement may be organic (small scattered regions of actual inflammation) or merely functional (muscular spasm secondary to adjacent inflammation in paravertebral joints). The latter possibility is presumably the basis for the symptoms of the patient in question. Mild degrees of inflammation in apophysial joints cannot be excluded entirely, since roentgenographic evidence of destructive articular changes is only apparent when significant destruction of cartilage or subchondral bone or both has occurred. Unfortunately, when rheumatoid spondylitis severely involves the cervical region, it is often refractory (at least temporarily) to nearly all therapeutic efforts. In most instances passage of time and control of the systemic disease result in subsidence of the symptoms.

Therapeutic efforts to relieve symptoms should be both local and general or systemic. Some suggestions are as follows: 1. Relieve pain temporarily by giving other analgesics or increasing the dose of acetylsalicylic acid. Patients often tolerate 60 to 80 grains (4 to 5.3 Gm.) daily of this or other salicylate analgesics and are thereby more comfortable. 2. For local mechanical support apply a plaster cervical collar extending downward from the chin anteriorly and the occiput posteriorly to cover the top of the shoulders. Irritation of inflamed regions may be notably decreased thereby. The support may be worn from three to twelve weeks or longer if desired. Subsequently a leather or other removable type of cervical collar may be used, and thus maintenance of as nearly normal range of motion as is possible in any particular case is permitted. 3. Further trial of roentgen therapy to the spinal column may be advisable since " some benefit" was noted from its use. Whether full advantage has been taken of this treatment for control of rheumatoid spondylitis, both locally and generally, should be determined by reviewing the amount and type of roentgen therapy given. In a recent paper R.H. Freyberg *(M. Clin. North America* 30: 603 [May] 1946) summarized the usual extent of such treatment. 4. Physical medicine should be employed in order to obtain as nearly normal range of motion and to prevent deformity as much as possible, even though the immediate results (symptomatically) of such treatment may not be as great as might be desired. 5. General measures should be used to improve the patient's resistance against ravages of the disease. More than the normal hours of rest in bed are needed to prevent muscular and nervous fatigue and a consequent increase in symptoms. This is especially important when progression of the disease is difficult to control. In some instances complete rest in bed for several weeks may be advisable. The patient with rheumatoid spondylitis should lie on the back and sleep without pillows on a firm, supported and nonsagging mattress.

STERILITY IN THE MALE

To the Editor:—In The Journal of Nov. 15, 1947, page 746, the answer to a query concerning sterility in a male makes no mention of the value of the follicle-stimulating hormone test *(J. Clin. Endocrinol. 3:529, 1943)*. The patient under discussion had gynecomastia, small testes and azoospermia. In such a patient determination of the urinary excretion of follicle stimulating hormone is necessary to determine whether the lesion is of pituitary or testicular origin. If the excretion of follicle stimulating hormone is increased, the primary lesion is in the testis and further stimulation with a tropic hormone would be of no benefit. If such excretion is normal, the azoospermia is not of endocrine origin. If the excretion is decreased, the primary lesion is in the pituitary. Only in the last eventuality would treatment with a tropic hormone be indicated. Unfortunately, no such hormones are of proved value in stimulating spermatogenesis in man, and they may even be detrimental because of antihormone formation.

Harry F. Klinefelter Jr., Baltimore 2.

VITAMIN C IN RHEUMATIC FEVER

To the Editor:—Please give references concerning use of ascorbic acid (1000 mg. intravenously two or three times weekly) in rheumatic fever. This has been advocated for a college student who had rheumatic fever " several years ago." At present signs of reactive infection are absent. What is the rationale of this treatment, its contraindications, and the dangers?

ANSWER—Ten or more years ago Rinehart and associates published papers (Rinehart, J.F.; Connor, C.L., and Mettier, S.R.: Further Observations on Pathologic Similarities Between Experimental Scurvy Combined with Infection and Rheumatic Fever, *J. Exper. Med.* 59:97 [Jan.] 1934) on vitamin C deficiency as a possible factor in rheumatic fever. In their experimental animals a combination of injection and vitamin C deficiency produced lesions similar in type and distribution to those of rheumatic fever. Other pathologists in reviewing this material were less impressed by the similarity.

In the light of this experimental work Faulkner (Faulkner, J. M.: The Effect of Administration of Vitamin C on the Reticulocytes in Certain Infectious Diseases, *New England J. M.* 213:19 [July 4] 1935) studied the effect of large doses of vitamin C (200 to 300 mg. per day) in 27 patients with rheumatic fever and observed no influence on the course of the disease.

The present belief is that adequate doses of vitamin C are as essential in the diet of patients with rheumatic fever as in any other acute or subacute disease, but that massive doses above the normal requirements have no specific effects.

SURGICAL AND RADIATION THERAPY FOR CARCINOMA OF THE CERVIX

MANUEL GARCIA, M. D.
and
LEON J. MENVILLE, M. D.
New Orleans

The added safety of radical surgical treatment for carcinoma of the cervix, and the recent proposals urging its more extensive use, have made it necessary that the respective merits of methods of controlling the disease be subjected to analysis. Despite their limitations, both radical surgical treatment and radiation therapy have progressively established their value over the course of the last forty years, and sufficient data have accumulated to permit definition of the most promising therapeutic policy by objective consideration of the evidence. In the present report the salient factors bearing on this question will be reviewed.

A satisfactory plan of treatment must be based on knowledge of the pathology of the disease and of its paths of dissemination. A number of studies on autopsy and surgical material have enabled us to specify minimum requirements for a satisfactory plan of treatment (Kundrat, Baisch, Pankow, Martzloff, Pearson, Warren). It has been shown that uremia, general exhaustion, hemorrhage, intestinal obstruction and sepsis are the principal causes of death among untreated as well as treated patients, the anatomic mechanism and clinical background for each of these lethal factors must be sought in the study of patients, and proper corrective measures instituted. Since the disease is almost exclusively confined to the pelvis, the therapeutic effort should be directed to the extirpation or destruction of carcinoma in the uterus itself, the vagina, the parametrium and the group of pelvic nodes referred to as nodes of the first stage; these include the ureteric, obturator, hypogastric, principal node (Leveuf and Godard) and common iliac nodes. These requirements are satisfied by radical abdominal hysterectomy of the type proposed by Emil Ries or by combined intracavitary radium therapy and external roentgen therapy. The radical hysterectomies practiced by Wertheim and by Schauta and their followers have a lesser scope but have proved rather successful in the control of the disease. Occasional cures have been reported after cauterization of the local tumor, simple amputation of the cervix and total hysterectomy either by the abdominal or the vaginal route, but none of these procedures can be given serious consideration in a discussion of effective therapeutic measures, unless supplemented by rather thorough irradiation.

Survival for five years without evidence of the disease is the accepted criterion for assessing the efficacy of methods of treating cancer. Yet there has been repeated infraction of this rule in recent publications urging major changes in policies of treatment. Shorter periods of observation do not permit reliable conclusions as to the permanency of control, while in longer periods the effect of extraneous factors becomes significant. Thus deaths from intercurrent disease and loss of patients from observation cast too great an influence on the relation between the number of patients treated and those known to be well, if the chosen period is unduly long. Since carcinoma of the cervix presents many clinical variations, a great deal of deliberate or involuntary selection is practiced. This has necessitated that statistical evaluation of results be performed only under rather stringent rules. Those proposed by Winter early gained wide acceptance, and similar ones were adopted by the Radiologic Sub-Committee of the League of Nations. Unless otherwise specified, the absolute salvage rate will be used in all our comparisons. By this is meant the proportion of patients alive and well at the end of five years out of the entire number of applicants, whether treated or not. The absolute salvage rate of a clinic is indicative of its minimum achievement and is considered the only reliable means of comparing the work of different institutions or different methods of treatment. However, inequalities in the initial clinical material persist—that is, the proportion of cases of

---

Read before the Section on Radiology at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 13, 1947.

From the Department of Radiology, Charity Hospital of Louisiana at New Orleans and the Tulane University of Louisiana School of Medicine.

Because of lack of space this article has been abbreviated in THE JOURNAL by omission of the bibilography. The complete paper will be found in the authors' reprints, which the authors will be pleased to send on request.

advanced disease varies in different institutions. For this reason several schemes have been proposed for classifying the cases on admission. Of these the League of Nations classification is the one most widely employed and will be used exclusively in our tabulations.

The historical evolution of treatment has been traced in valuable papers by Schmitz, O'Brien and others, and the topic will not be rehearsed here. Progress in the results of treatment for carcinoma of the cervix is well illustrated by the experience at Mayer's clinic, in Tübingen, which is typical of many others. The data (given by Reichenmiller) have been expressed graphically in charts 1 and 2.

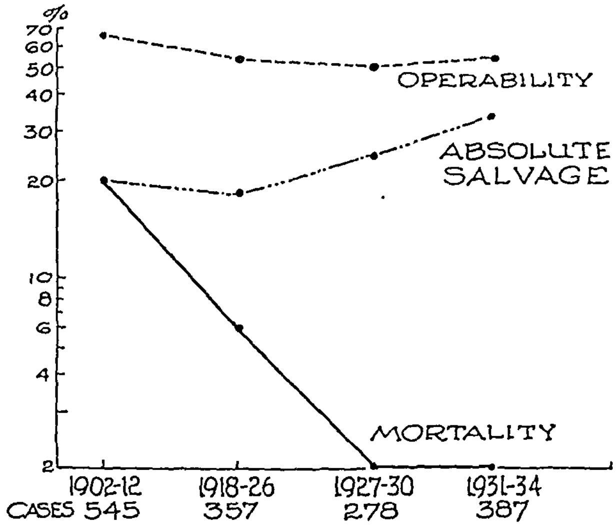

Chart 1.—Progress in the treatment of carcinoma of the cervix (Mayer, Tübingen, 1902-1934).

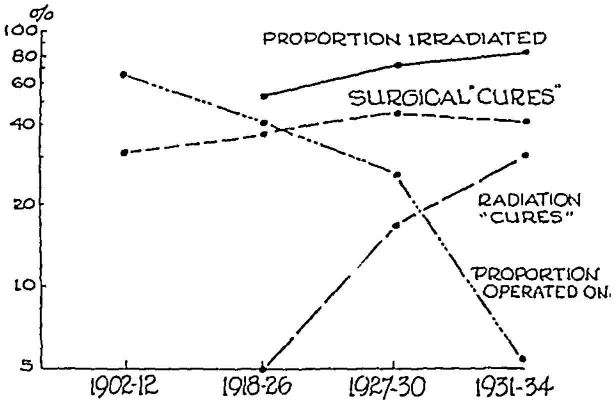

Chart 2.—Trend in the therapy of carcinoma of the cervix.

It can be seen that the quality of the clinical material, as shown by the operability rate, has, if anything, deteriorated. Still, there has been a sharp rise in the absolute cure rate simultaneous with a decided drop in the mortality from treatment. Chart 2 exemplifies the general trend of treatment until recent years. There has been a gradual increase in the proportion of irradiated patients with a reciprocal decline in the proportion of those submitted to radical surgical treatments. The salvage in the surgical group has remained unchanged since the early part of the century, while the radiation salvage has shown progressive improvement. Nevertheless, many gynecologists have continued to practice the operative treatment, and have maintained it at a high level of efficiency.

SURGICAL THERAPY

Radical surgical therapy for carcinoma of the cervix has been used with three objectives in view: (1) as the sole method of treatment, in which case from 50 to 80 per cent of the patients are subjected to operation; (2) as a means of treating the more favorable cases, so that from 20 to 50 per cent of the patients are operated on, and (3) as a supplement to radiation for the earliest stages, when only 10 per cent or less of the patients are operated on. The distinction is important because the operative mortality and the recovery rates are quite different. Table 1 shows what the ablest surgeons of the world have accomplished when the operation is given its widest possible scope. This record of success must be acknowledged as one of the great achievements in the surgical therapy of cancer. Even so there are no longer any proponents of the exclusive use of surgical therapy. Instead, the aim has been to afford each patient the maximum opportunity for recovery with minimum primary risk: in favorable cases, averaging one third of the material, the patients are operated on and often irradiated too, while the rest are treated by radiation alone. This plan has been called "elective therapy" by Stoeckel and appears to be widely practiced in Central Europe. Table 2 demonstrates that "elective therapy" gives significantly better results than those obtained during the strictly surgical era. The modern surgeon, conscious that the patients whom he rejects are not necessarily doomed, can set up extremely rigid criteria for his operative cases. He can exclude all patients on the borderline of operability, the ones who have systemic complications that increase the risk of operation, and also the feeble, the aged and the obese.

If to this careful selection is added perfection of surgical technic, and the advantages of general surgical progress, in the way of improved anesthesia, antibiotics and transfusion and other supportive measures, it is not surprising that the surgeon of sound judgment and good training has every right to practice the operation, confident that his patients run a negligible risk. The control of shock and sepsis and the more restricted selection of patients have made possible the reduced operative mortality rates shown in table 3. There has been a corresponding decrease in the incidence of serious surgical complications. The incidence of urinary fistulas ranges between 2.9 and 12 per cent. Some of these heal spontaneously; others require nephrectomy, and still others can be successfully repaired at the cost of a small mortality. Rectal fistulas are less frequent but more serious. Other complications include infection of the urinary tract, the pelvis and the surgical wound. Bonney reported 4 late deaths (1 per cent) as a consequence of operative sequels. An unavoidable disadvantage of surgical therapy is the removal of part or all of the vagina, which makes marital relations difficult or impossible.

Distribution of Recurrences.—According to Bonney, reactivation of the disease following surgical treatment may occur in the pelvis or in distant areas. Among his 430 operative survivors there were 193 recurrences, an incidence of 45 per cent within five years. Three fourths of the recurrences appeared within the pelvis and the balance in distant regions. More specifically, the operative survivors had local recurrences in the vagina, rectum or bladder in 11 per cent; in the soft tissues and bones of the pelvic wall in 22 per cent; in the abdomen and spine, in 8 per cent; in the lungs, in 2 per cent and in other areas in 1 per cent. It is thus seen that failure to control the disease surgically occurs in one third of the operative survivors as a result of renewed activity within the pelvis. Furthermore, 65 per cent of all the recurrences appeared within two years. Schweitzer, Mayer and Weibel reported that 83 to 85 per cent of the recurrences show up within three years. A smaller number of recurrences continue to appear up to the tenth year, and Weibel discovered one sixteen years after operation.

Factors Influencing Recovery.—An effort has been made to correlate the histologic grade of the tumor with the chance for recovery, but observations on this point conflict. Martzloff and Broders showed a definite decline in the recovery rates as the neoplasm becomes more anaplastic. In an analysis of 254 cases Kamnicker could ascribe no prognostic significance to the degree of ripeness of the tumor when the Schauta operation was performed, whether it was used alone or in combination with radiation therapy. A similar conclusion must be derived from the material analyzed by Philipp (52 cases), though in an earlier report he stated that 8 out of 10 patients with low grade tumors without nodes remained well for five years. The age of the patient has been found significant in relation to the operative mortality. Franz had 6 operative deaths among 12 women past 60, none of whom survived five years. Fourteen who were less than 30 years of age had no surgical mortality, and 8 remained well five years. Clauberg reported 31 per cent five year salvage in 51 women past 55 as compared with 50 per cent in 109 younger women. Schweitzer confirmed the inferior results in the advanced age groups, but pointed out that no patient less than 30 years of age remained well for five years. Weibel in an analysis of one thousand operations reported no correlation between the incidence of recurrence and the age of the patient.

The clinical and anatomic extent of the disease affect recovery. Weibel and Kermauner classified their cases after operation into four groups, according to the extent of involvement of the pelvic structures. In the first and second groups were incipient and extensive lesions of the cervix, respectively; in the third, involvement of the parametrium or the pelvic nodes was noted; in the fourth, there was fixation to other structures, making dissection difficult and in some instances requiring resection of the bladder, ureter or rectum. The recovery rates in the combined material were as follows: group A, 206 cases, 62 per cent; group B, 700 cases, 50 per cent; group C, 548 cases, 25 per cent; group D, 167 cases, 11 per cent. Weibel had only 1 recovery among 38 patients requiring some form of resection. Bonney considered invasion of the bladder incurable by surgical treatment and expressed the belief that resection of the bladder is useless. On the other hand, 5 recovered out of 13 in whom he performed grafting of the ureter. According to Martzloff and to Norton microscopic proof of parametrial invasion is a sign of incurability. Extension of the disease beyond the cervix not only impairs the chance for recovery but also increases the immediate mortality. Thus, the mortality was 10 per cent in groups A and B and 20 per cent in groups C and D. A correlation can be established also between the chance for survival and the extent of the disease determined by clinical examination. The following recovery rates were obtained by combining material reported by Schilling, Schroeder, Lauterwein and Caffier: stage 1, 115 cases, 68 per cent; stage 2, 324 cases, 42 per cent; stage 3, 84 cases, 33 per cent. (Compare with radiation results in table 11).

TABLE 4. – *Microscopically Proved Pelvic Node Metastasis And Its Influence On The Surgical Results*

	Totals	517	15	1,515	51	25
Primary Mortality		19 (438 Cases)		14 (1,134 Cases)		

Metastasis to Pelvic Nodes.--Table 4 exhibits some of the factual data available on the relationship of recovery and carcinomatous involvement of the pelvic nodes.

Whereas half the patients without metastasis remained well five years after surgical treatment, only less than one sixth of those with microscopic proof of metastasis in the nodes recovered. In addition, the presence of metastasis increased the operative risk. This has made some operators abandon routine dissection of the pelvic nodes, which seems to be an error, since dissection has been shown to improve the salvage significantly by about 5 per cent.

Preoperative and Postoperative Irradiation.-Many surgeons have combined roentgen and radium therapy with operation, hoping to improve the results. Adler is convinced of its worth and reported 59 per cent salvage when the Schauta operation is combined with moderate irradiation, as compared with 42 per cent when the operation alone is done. Mayer, Zweifel and others have advocated the combined treatment. In 1934 Lacassagne pointed out that the amounts of radiation employed in combination with surgical treatment were considerably below the doses that could be expected to have a lethal effect on residual cancer cells. He objected that adequate therapy by radiation would be handicapped if recurrences appeared later. This line of reasoning has been repeatedly employed in connection with postoperative therapy in other sites, as a substitute for consideration of the actual facts. The facts prove the value of combined treatment beyond any reasonable doubt. Schinz in 1936 made an analysis of the results reported by ten clinics. His findings were as follows:

Operation	Operation and Radiation
337 patients well out of 882	446 patients well out of 807
Recovery rate 41.0 ± 1.7%	Recovery rate 55.5 ± 1.8%

Difference 14.3 ± 3.66%

The observed difference is nearly four times the standard error, a deviation that could be ascribed to chance only once in a thousand trials. Hence it is proper to conclude that when radiation is added to surgical therapy the results are decisively improved. We have been able to collect the following corroborative evidence:

	Surgical Treatment	Surgical Treatment and Radiation
Masson	221 cases, 40%	217 cases, 56%
Stage 2 (collected cases)	374 cases, 39%	228 cases, 53%
Stage 3 (collected cases)	117 cases, 26%	94 cases, 33%

The stage 2 and 3 cases were collected from authors listed in table 12. The chi square test indicates that the results are significantly improved by radiation in stage 2 and in Masson's cases; the stage 3 cases are in groups too small to yield reliable conclusions.

Lynch and Martzloff have emphasized an additional advantage of preliminary irradiation. Its healing effect reduces infection, and the risk of peritonitis at operation is thereby minimized.

RADIATION THERAPY

As indicated in table 5, irradiation first established its value as a palliative agent in the treatment of advanced disease. In this respect it remains unrivaled and unchallenged today. Not only are symptoms relieved but life is prolonged, as attested by comparison of the survival curves of treated and untreated patients in chart 3. Of greater importance of course is the ability of radiation therapy to produce definitive cures. Between 1908 and 1915 several clinics turned to the exclusive use of radiation therapy, and the success achieved with this safer method (table 6) prompted a nearly complete replacement of radical surgical treatment. Improvements in technic have brought about further gains in the absolute salvage as demonstrated in table 7.

Mortality.--The principal risk of radiotherapy is exacerbation of sepsis, which may become severe enough to terminate fatally. Other factors related to treatment are exhaustion and embolism. Table 8 illustrates the range of mortality reported in the literature. As in the case of surgical therapy, the mortality is dependent to a large extent on the manner in which treatment is executed. Clinics where excochleation or cauterization of the cervical tumor is practiced routinely report rather high primary mortalities. Feeble and aged patients with intercurrent disease may die of exhaustion if the treatment is carried too aggressively. This has been pointed out by Morton in connection with roentgen therapy. That radiation therapy can be carried out with perfect safety is demonstrated by the report of Waterman and DiLeone, who had 353 consecutive cases without a death.

Morbidity and Sequels.—Immediate morbidity is manifested in the form of radiation sickness, exhaustion or irritative phenomena in the skin, the urinary and the intestinal tracts, and by flare-up of latent infection. Under skilful management these reactions are transient and rarely associated with severe discomfort. Late sequels become apparent as injuries of variable severity. They include ureteral obstruction, claimed to be due to edema or fibrosis, ulcer of the bladder, factitial proctitis, intestinal bleeding and obstruction, and fistulas of the bladder, rectum or intestine; in addition in less than 1 per cent of the cases fractures of the femur or of

the pelvic bones develop. The most frequent complication is fistulous formation, which arises in the majority of instances in connection with recurrence; that is, from failure to control the disease by radiation. Healy reported 95 fistulas among 2,852 patients treated between 1916 and 1932, an incidence of 3.2 per cent. In early lesions it was 1.4 per cent, in all primary cases 2.5 per cent and in recurrent cases 6.4 per cent. Infection, repetition of treatment and the employment of interstitial foci increased the incidence. These findings were confirmed by Maliphant, who added that the average length of life following the appearance of a fistula was ten months. Recently Taylor and Twombly were forced to abandon interstitial radium therapy because of the high incidence of complications. The perfection of intracavitary radium technics has made fistulous formation from radiation itself a rare accident. Hurdon found only 2 among 700 patients treated at the Marie Curie hospital. Dietel had none among 316 patients. Factitial proctitis and ulcers of the bladder have been practically eliminated in many clinics. Dietel reported 1.26 per cent, Hurdon 2 per cent, and at Charity Hospital there was 1 per cent. In a few clinics the incidence and severity of sequels have been much greater. Smith and Dresser reported late deaths from radiation injuries in 2 per cent of their cases, but, as they declared, at least half were due to injudicious overtreatment. In addition 21 per cent of the five year survivors had complications that could be attributed to treatment. Waterman and DiLeone reported injuries to the urinary tract in 12 per cent of their cases and to the intestinal tract in 13 per cent. As pointed out by Leucutia, these discrepancies are related to the variation in the methods of treatment practiced. The following factors tend to increase the incidence of undesirable sequels: Employment of large roentgen ray fields, especially with supervoltage, giving unnecessary irradiation to the intestine, bladder and rectum; administration of the same air dose to all patients, disregarding the geometric relations in the individual case; cross firing the cervix itself with several roentgen ray fields before or after heavy radium therapy; concentrating the treatment in a brief space of time; improper distribution of radium foci; injudicious repetition of treatment, and employment of interstitial radium therapy.

Permanency of Healing.—Comparison of the results of surgical therapy and irradiation at five years discloses no reason for preferring either, but the claim has been advanced that the incidence of recurrence is greater after five years among irradiated patients. For this reason we have gathered some pertinent data in tables 9 and 10. No significant differences can be demonstrated in the absolute salvage obtained by radiation and by surgical treatment after ten years. Over the span of a decade deaths from intercurrent disease assume significance; as a consequence Paterson has suggested that the ten year rates should be computed on an actuarial basis. When this is done the risk of dying from cancer in the ten years succeeding treatment is about 75 per cent.

* Estimated from his operability rate.

Permanency of healing can be determined by the ratio of ten to five year survivors (Kimbrough and Tompkins). This ratio averages 75 per cent in cases of irradiation and is approximately the same in operative cases, though information on this point is rather incomplete. Such finding is contrary to expectation; the ratio should be significantly higher in the surgical groups. Operative patients have a better life expectancy at the time of treatment. They include a greater proportion of favorable lesions; their mean age is lower, and they are otherwise selected because of superior physical status and greater freedom from complications. All these factors should militate against equality of survival. Consequently, equal ratios mean greater success with the inherently poorer material handled by radiation. The incidence of recurrences among the five year survivors was determined by Lauritzen in a group of 222

χ^2 = 5.890, N = 8, P>50%

*Bonney reported 201 survivors among 500 cases followed five years. His ten year series numbered 115 cases; adjustment was made accordingly.

"cures" followed at Radiumhemmet for periods up to eighteen years. He estimated that the total chance for recurrence after the fifth year is about 12 per cent, and after the tenth year less than 5 per cent. In his series no recurrences were observed after twelve years, but isolated cases are described showing recidivation after the twentieth year.

Factors which Influence Recovery.—Of the numerous factors that have been analyzed only a few can be considered. The age of the patient has been shown to have no consistent relation to the possibility of cure. The same may be said for the grade of the tumor (Bowing and Fricke, Healy and Frazell, Jones and Jones, Wetterdal, Chambers and Gulik). Healy and Cutler and Maliphant showed better results with anaplastic tumors, whereas Glucksmann reported greater salvage in the more adult type. It is probably true that the response of tumors to radiation cannot be predicted reliably by histologic classification prior to treatment. On the other hand, the study of serial biopsies reveals important information, greater use of which will no doubt place the therapy of carcinoma of the cervix on a more rational basis. Histologic changes in the tumor during the course of irradiation have been described by Arneson and Stewart, Warren and his co-workers and others. Glucksmann has placed the analysis of serial biopsies on a quantitative basis and has found that the changes observed constitute an important prognostic aid. Recently Ruth Graham described the changes in serial vaginal smears during the course of treatment using the Papanicolaou stain. She found that the cellular changes give a good indication of the reaction to radiation in the individual tumor. It would seem, therefore, that with increased knowledge of these methods dosage could be modified to suit the individual case, and prompt recognition of the cases that will do badly with radiation may become possible.

Clinical Extent of the Disease.—All series show that the chance for recovery is inversely correlated to the extent of the disease as determined by clinical examination. Table 11 includes cases reported by Schreiner, Heyman, Hurdon, Maisin, Eymer and den Hoed. These authors have been chosen because untreated patients make up a negligible fraction of their material (less than 3 per cent for the total); hence the question of selection can be ignored. In addition a variety of technics is represented, and the individual series are large enough to exclude the distortion produced by a run of favorable or unfavorable cases. Since all these patients were treated prior to the 1937 revision of the League of Nations classification, it is likely that a similar compilation in the future will show lower rates of salvage for stages 3 and 4.

Infection.—The studies of Ducuing, Goldscheider and Garcia and Schlosser have demonstrated that infection is a frequent and serious handicap to treatment and that it significantly impairs the results. Goldscheider gave a recovery rate of 12 per cent in 341 cases with fever, whereas the rate was 52 per cent in 568 afebrile cases. The impressive results achieved in the absence of infection are illustrated in table 11. When it is realized that septic complications of importance are present in one fifth to one third of all cases, it becomes apparent that effective measures to combat infection constitute one of the essential needs.

Efficiency of Treatment.—Complete radiation therapy is not possible in all cases. Factors like infection, urinary obstruction with renal damage, severe debility, intercurrent disease, lack of cooperation on the part of the patient, extremely advanced lesions and anatomic variations like vaginal stenosis and occlusion of the cervical canal interfere with the administration of adequate treatment. These difficulties have been discussed by Lacassagne, Buschke and Cantril and others. Approximately 60 to 80 per cent of the patients seen at most clinics ordinarily receive what is considered full treatment. Naturally the patients completely treated have a better chance for recovery (table 11). The results obtained must be interpreted in the light of the degree of selection that made them possible, but they reveal nevertheless what can be accomplished when favorable circumstances prevail and constitute an inducement for overcoming the obstacles that prevent attaining the same results in all cases.

TABLE 11.—*Results of Radiation Therapy in Relation to Clinical Stage*

	Stage 1		Stage 2		Stage 3		Stage 4		Total	
A. Relative salvage	No.	%	No.	%	No.	%	No.	%	No.	%
Heyman (1934-1938)	102	67	623	46	366	24	133	10	1,224	37

Nodes: It is impossible to obtain conclusive information on the effectiveness of radiation in the presence of metastasis to nodes, since only exploration of the pelvis before and after treatment could disclose (incompletely) the status of the nodes. Despite this difficulty it has been stated categorically that radiation cannot control metastases. But indulgence in such assertion is not vindicated by indirect evidence. The fact that some patients with proved metastases have not been cured by radiation is irrelevant; it lacks significance when one realizes that the same is true in surgical cases, and yet we have proof that a few recover after extirpation of the nodes. It has been contended also that radiation has failed in the treatment of metastases in the neck, and therefore it cannot reasonably be expected to succeed in the pelvis. This is incorrect. Anatomic circumstances permit thorough ablation of the cervical nodes without sacrificing vital structures; hence radical dissection is frequently the treatment of choice. But this does not mean that radiation is wholly ineffectual. Under suitable circumstances permanent control of histologically verified metastases has been obtained consistently enough to justify reliance on radiation therapy alone.

The salvage attained by radiation in consecutive admissions is presumptive evidence that some cases with metastases are controlled (Smith and Dresser).

In an analysis of Pankow's material, correlating clinical classification and histologic changes after operation, Taylor has pointed out that 76 per cent of stage 3 cases have microscopic evidence of carcinomatous invasion of the lateral parametrial edge or of the pelvic nodes. If one assumes that radiation cannot affect the disease in these areas the salvage in stage 3 cases should rarely exceed 24 per cent. But 1,827 stage 3 cases collected from eleven reports show a salvage averaging 38 per cent (Laborde, Wilkins, Martius and the authors in tables 7 and 11). Departure from expectation is too great to be attributed to chance ($X^2 = 22.175$; $N = 10$; $P < 2\%$). Therefore the assumption must be wrong.

Taussig performed iliac lymphadenectomy in 175 stage 2 cases and found metastases in 27 per cent. He noted a reduction in their incidence as the dosage of preoperative roentgen therapy was increased. His first 70 cases showed definitely superior results when compared with cases in which treatment was by radiation alone during the same period. But with improvements in radiation therapy the advantage has not been maintained in the cases reported later by Emmert and Clarke.

In Morton's cases in which lymphadenectomy was done metastatic nodes were found in 11 of 28 patients who had no roentgen therapy prior to operation, and in 4 of 35 patients who had preoperative roentgen therapy, despite the fact that the latter had clinically more advanced lesions. The difference is statistically significant ($X^2 = 6.65$; $P = 1\%$); consequently the preliminary irradiation has produced a definite effect, and it must be concluded that some of the metastases have been destroyed.

Failure in Early Cases.—Hultberg, Brenier, and Meigs have emphasized that early cases (clinical stage 1, at least) should have the benefit of a hysterectomy to improve the salvage. The incidence of recurrences after irradiation is said to be unduly high, and attention has been called to the presence of apparently viable cancer cells in about one fourth of the cases in which hysterectomy has been done after radium therapy. This observation must depend to a certain extent on the completeness of treatment, but is difficult to interpret in any event. The presence of apparently viable cancer cells is no proof of failure of radiation, since the subsequent behavior of such cells is unknown. The only valid manner of testing the efficacy of treatment is by the five year results. Accordingly, we have made an analysis in table 12 of the results obtained with three plans of treatment in 1,063 stage 1 cases. The possible influence of differences in classification can be excluded, since only cases treated in the same institution over the same period of years are considered. The series have been segregated into two groups, because the salvage for each method of treatment in group A is not consistent with the corresponding one in group B. Whether the groups are considered separately or together, the results of radiation therapy alone and those of the combined treatment do not differ significantly. On the other hand, the salvage in the surgical cases is significantly lower than that obtained with either one of the other two methods. While the routine performance of hysterectomy thus appears to exert no definite improvement in the results, there is no doubt that many lives could be saved if it were employed promptly in technically and clinically operable cases whenever the immediate effects of radiation prove unsatisfactory. Serial biopsies will enable us to make a more dependable evaluation for this purpose than was the case formerly, when we had to rely on clinical findings.

TABLE 12.—*Comparative Results of Surgical Treatment and Radiation, Separately and Combined, in the Treatment of Stage 1 Cases. Same Institution, Same Period of Years**

		Surgical Treatment		Radiation		Combined Treatment		Total

						t : 1.348 P > 10%			

*The material is separated into two groups because tests of significance show lack of homogeneity within columns when all elements are considered together. Mean salvage discrepancies between columns was tested by Student's distribution, but only two are indicated in the table: Comparison between radiation and combined treatment in the entire material, and between surgical therapy and radiation in group B.

COMMENT

The foregoing analysis indicates that "elective therapy," the complementary use of surgical treatment and radiation, and radiation alone yield equal absolute salvage, on an average, 32 per cent at five years. Preference for either must depend on the quality of the skill available.

With scrupulous care in technical details the primary mortality and morbidity and the late sequels of either method can be reduced to a satisfactorily low level. Since this is a lethal disease, control of which requires drastic measures, a demand for complete safety is unreasonable.

The risk of failure from inadequate treatment is far more serious than the risk of injury from proper treatment. Hence a small proportion of undesirable sequels must be accepted as the price of effectiveness.

Of the two methods of treatment surgical therapy may be said to have reached the zenith of its perfection. Its best results become apparent when cases are carefully selected. Hence its influence on the absolute salvage is dependent on the composition of the material. On the other hand radiation therapy, while exhibiting the same limitations to a lesser extent, is nevertheless capable of further improvement. This need not wait for the discovery of new principles of treatment, but will issue from the general adoption of the methods shown to possess greatest merit. It must be acknowledged that efficiency in radiation therapy has lagged behind efficiency in surgical therapy. There has been an unfortunate reluctance to profit by the experience of others. We often adhere to deficient technics as a tribute to tradition or as an obligation to expediency. Contrariwise, novel departures from established practice have been undertaken as an exercise in originality with little regard for the consequences. While the trial of new methods usually leads to progress, the desire for improvement must not be allowed to sacrifice advantages already won. Testing new plans of radiation requires special caution, since injuries may not become apparent till months or years have elapsed. Awareness of the intangible factors in radiation therapy made Zweifel remark that proficiency was difficult to acquire. Much of the dissatisfaction recently expressed arises from an unwillingness to peer beyond the deceptive superficial simplicity of the method.

An analysis of the technics of radiation therapy is not possible here, but two certainly satisfy the requirements of effectiveness and safety: the Regaud and the Forsell technics of radium therapy, supplemented by external roentgen or teleradium radiation, using small fields (Paterson, Martius, Silverstone and others, Walker and Taylor). The value of these methods is further enhanced by precalculation of the tissue dose and, according to Glucksmann, by the study of serial biopsies during treatment. More careful appraisal of the individual patient, full use of supportive measures and the suppression of infection and of other obstacles to complete treatment will substantially improve the salvage.

If the worth of a method of treatment is to be judged by universality of scope, low primary risk, relative freedom from disabling complications, unsurpassed absolute salvage, permanency of control and potentialities for improvement, then review of the factual evidence establishes radiation therapy as the treatment of choice for carcinoma of the cervix. The irreplaceable value of surgical therapy today lies in its power to cure in those clinically and technically operable cases that yet remain biologically unsuitable for control by radiation therapy.

SUMMARY

In an analysis of the factual evidence on surgical and radiation therapy for carcinoma of the cervix it is shown that radiation alone and "elective therapy" yield equal absolute salvage—on an average, 32 per cent at five years. The factors that influence control are discussed. Preference for radiation therapy is expressed. It is recommended that the Forsell or the Regaud technic of radium therapy be employed with external roentgen or teleradium therapy through small fields. It is proposed that with precalculation of the tissue dose and the performance of serial biopsies truly refractory cases will be recognized. For such cases prompt resort to radical surgical treatment is urged.

ABSTRACT OF DISCUSSION

DR. KARL H. MARTZLOFF, Portland, Ore.: It is important to realize that surgery and radiology are not competing elements in the treatment of cervical cancer. They should be used either singly or in combination according to the merits of the individual patient's problem. Operation is indicated when the neoplasm is refractory to radiation. However, any one who again advocates a more general application of the radical abdominal operation with its formerly unsavory reputation and in the face of the apparent excellent experience obtained with radiation therapy faces a serious responsibility. Nevertheless, the proposal is made to utilize more generally the radical operation as a curative procedure. To justify this one is obligated to answer some pertinent questions. First, is radiation therapy falling short in such a way that operation theoretically might prove more effective in patients suitable for surgical treatment? Next, can the operation be done with a hazard comparable to or slightly greater than that following adequate radiation therapy? Will the anticipated increased salvage give an expectancy of cure well above that ordinarily obtained by radiation therapy in a similar stage of the disease? The first query is answered by the observation that cervical cancers which have healed after apparent adequate radiation may show identifiable cancer cells in one fourth to one fifth of the operatively removed specimens. Corroborative of this is the clinical remanifestation of cancer in previously healed and apparently adequately radiated cervices about which the radiologic literature is strangely silent. Personal observation, a few reports by critical workers and personal correspondence reveal that among patients in clinical stages 1 and 2 and also possibly some stage 3 patients who have received complete courses of radiation therapy, from 15 to 50 per cent of those who die succumb to recurrence in the previously radiated cervix or proximal part of the vagina. Dr. Garcia has mentioned the lessened mortality that now exists with the radical surgical procedure. It is obvious that with proper therapy, the mortality from a completely radical operation is less than 4 per cent. Schlink and Chapman reported a 3.5 per cent mortality and 62.7 per cent five year cures among stage 1, 2 and 3 patients who were given preoperative radiation. Meigs and myself have had an operative mortality under 2 per cent. In view of the foregoing it appears desirable to operate on any patient with cancer of the cervix if she presents no general or local contraindication for radical surgical treatment. Thereby a cervix and vaginal cuff are removed which under radiation therapy might show a fatal remanifestation of the disease. This, as has been indicated, far exceeds the mortality of a properly performed operation.

DR. J. HEYMAN, Stockholm, Sweden: It would be wise to define what is meant by combined surgical and radium therapy. Some want to apply surgery as a prophylactic method to avoid local recurrences. If this is what is meant by combined surgical and radium therapy, then those who wish to use this therapy have to tell us on what patients we should operate. To me it is obvious that there are only two ways in which to proceed: either not to wait for the primary results of radium therapy but to operate on all patients who after preoperative irradiation are considered operable, or to await the result of primary radium therapy and to operate on all patients clinically cured. I cannot see any other method by which one can define on what patients one wishes to operate. Having analyzed our large series of cases from these two points of view, I have shown in two papers published some years ago that my associates and I could not expect to improve the results which we have gained by radium therapy alone by applying either of these two methods. Another group who make claims for surgical treatment want to operate in early cases. That is to me no problem in the treatment of cancer of the uterus, because we know that we can cure 65 to 80 per cent of our patients in the stage 1 group Perhaps operation could give us better results, but the difference would have no effect of any importance on the absolute cure rate. I also consider that it would be advisable if those speaking of classification would tell us what classification they use. I should like to emphasize that by mentioning the League of Nations classification one may mean two quite different things. The League of Nations classification started in 1929 After about seven years of experience, we had to change that classification and propose a second scheme. These two classifications are different, and the differences are worth noticing. Today the League of Nations classification will include in stage 2 all cases with involvement of the upper two thirds of the vagina and parametrium, whereas in stage 3 only those cases are included in which the lower third of the vagina is involved and the parametrium to such an extent that the lateral pelvic wall is involved That means that patients allocated to group 3 cannot be operated on and the majority of patients referred to as stage 2 can also not be operated on There is a confusion today among the radiotherapists due to the fact that many of them are of the opinion that the only thing worth while is a method. That is not so, gentlemen! In addition to having a method of treatment it is necessary to have sufficient experience with the method which one uses. One can use either this method or that, and one will get good results when one has acquired sufficient experience. It is a bad way to change from one method to another and think that one will get results and not try to acquire sufficient experience. If every one sticks to the method to which he is accustomed and then we come together and compare results, we will find something.

TREATMENT OF MIGRAINE WITH HISTAMINE

Review of One Hundred and Forty-Four Cases

DOROTHY MACY JR., M.D.,
and
BAYARD T. HORTON, M.D.,
Rochester, Minn.

Histamine has been reported to have a prophylactic and a curative effect on migraine.[1] This drug has been used in the treatment of migraine at the Mayo Clinic since 1937. We are reporting the results of treatment in an attempt to evaluate histamine therapy in the clinical management of migraine.

CRITERIA

The majority of physicians who have carefully observed the syndrome of migraine agree that five factors are fundamental to that syndrome. These factors are: (1) periodicity, (2) cephalalgia, (3) gastrointestinal dysfunction, (4) cortical disturbance and (5) a familial history of migraine. It is generally recognized that all five factors are not necessarily present in any 1 case at all times, although many physicians would not hesitate to classify as migraine certain conditions in which all five factors never have been present. For this study, only those cases were selected in which both periodicity and cephalalgia were present in addition to any one or more of the remaining factors.

The cases included in this study have been divided into two groups: typical and atypical migraine. By "typical migraine" is meant periodic cephalalgia which is associated with any two or more of the following three factors: (1) gastrointestinal dysfunction, (2) cortical disturbance or (3) a familial history of migraine. By "atypical migraine" is meant periodic cephalalgia associated with any one of the three factors.

The term "periodic" is used to indicate that attacks recur at relatively equal intervals, over a prolonged period. The more pathognomonic feature of the periods is the apparent good health of the patient in the intervals between attacks.

"Cephalalgia" means headache. The location of the headache, or the site of greatest pain, need not always be the same in a given patient. It may be quadrantal, hemicranial or generalized.

"Gastrointestinal dysfunction" refers to nausea, vomiting, constipation, diarrhea or abdominal pain arising in the gastrointestinal tract. The term may include any one or more of these manifestations.

---

A., and Butler, S.: Treatment of Migraine with Intravenous Histamine, Am. J. Med. 1:39-44 (July) 1946. (*c*) Horton, B. T., and Macy, D., Jr.: Treatment of Headache, M. Clin. North America 30:811-831 (July) 1946. (*d*) Thomas, W. A., and Butler, S.: Intravenous Histamine in Treatment of Migraine, Bull. New York Acad. Med. 22:125-136 (March) 1946.

"Cortical disturbance" refers to transient psychic disturbances, scotomas, paresis or paralysis, or paresthesias which can be accounted for on the basis of localized cortical discharge.

A familial history of headache was not considered synonymous with a familial history of migraine. The same criteria were used for inclusion of migraine in the familial history as for establishment of the diagnosis in each case accepted for analysis and study.

By use of the criteria outlined, it is possible to exclude from the class, migraine, other types of primary vasodilating headache, such as histaminic cephalalgia. The exclusion of histaminic cephalalgia is essential, since histamine is specific in the treatment of that type of headache[2] and inclusion of histaminic cephalalgia in the present statistics would obscure the point at issue. These criteria also exclude the purely psychogenic and nervous tension types of headache.

The element of nervous tension is not always easy to determine, and may be a stumbling block for many physicians in interpretation of the problem. It is often an integral part of the syndrome of migraine. The frequency and severity of the attack of migraine may be determined by the element of nervous tension. It is important to realize this fact when an attempt is made to evaluate the therapeutic agents employed in treatment. Otherwise, erroneous conclusions will be drawn.

In migraine we feel that the pain is vascular in origin, and that there are three phases of the condition to consider.

The first is the vasoconstricting phase. This accounts for scotomas and cortical manifestations. Pain is not a factor of this phase—vasoconstriction, in itself, does not give rise to pain. A vasodilating agent may abort the attack if it is administered during the period of vasoconstriction.

The second is the vasodilating phase. The vasodilation is the immediate cause of the pain. Vasoconstricting agents, such as ergotamine tartrate and dihydroergotamine, if administered in appropriate doses early in this phase, will abort the majority of attacks.

The third is the edema phase. This naturally follows if the vasodilatation persists for any length of time.

It is well to keep these thoughts in mind when the attempt is made to evaluate a given therapeutic procedure.

How does histamine act in such a syndrome? The object of this report is to present a statistical analysis of 144 migrainous persons who have been treated with histamine at the Mayo Clinic since 1937. The mechanism and rationale of the action of histamine and various other aspects of the problem will be discussed in later publications.

MATERIALS AND METHODS

Series 1.—Two series of cases are being presented. The first series includes 124 migrainous patients seen at the Mayo Clinic between January 1937 and May 1945. These patients were treated with histamine and histamine only, in an endeavor to alleviate their symptoms. Histamine was administered by the subcutaneous route, the intravenous route or both routes.

Subcutaneous Administration: In subcutaneous administration a solution containing 0.275 mg. of histamine phosphate per cubic centimeter was used. This solution is equivalent to 0.1 mg. of histamine base per cubic centimeter. The initial dose was 0.1 cc. of the solution. Succeeding doses were increased by 0.05 cc. of the solution. Medication was given twice daily. In the event of the slightest facial flush, headache or subjective discomfort of any type, the dose was decreased by 50 per cent and the program was continued as before. The maximal single dose was 1.0 cc. of the solution. The final dose was the least amount of the drug which would maintain the patient free from migrainous symptoms obtained at any point during treatment. This dose was also the maintenance dose, when maintenance therapy was used. After the maintenance dose had been determined, the patient was dismissed. Administration of the maintenance dose was continued once daily for two weeks, then once every other day for six weeks, and twice weekly indefinitely. This schedule was modified, as seemed necessary, to meet each person's needs.

Intravenous Administration: Two and seventy-five hundredths milligrams of histamine phosphate was added to 250 cc. of isotonic solution of sodium chloride, and the solution was administered intravenously by the drip method, usually for a period of one and a half hours, once daily, in amounts as tolerated by the patient without causing a reaction to the drug. From 0.1 to 1.0 mg. of histamine base was received by the patients with each infusion, depending on the rate at which the solution was administered. Treatment was continued until the maximal therapeutic response for the particular patient appeared to have been obtained, the average period of treatment being two weeks.

Combined Intravenous and Subcutaneous Administration: A few patients treated by the intravenous administration of histamine showed such prompt recurrence of symptoms on cessation of therapy that it was necessary to continue the administration of histamine by the subcutaneous route. Cases in which both methods of therapy were used constitute the "combined" group. When the route of administration of the drug was changed, the dose was determined empirically. In retrospect, it is seen that the migrainous patient tolerates approximately ten times more histamine base when it is administered intravenously than when it is administered subcutaneously.

---

[2] Horton, B. T.; MacLean, A. R., and Craig, W. McK.: New Syndrome of Vascular Headache: Results of Treatment with Histamine Preliminary Report Proc. Staff Meet., Mayo Clin. 14: 257-260 (April 26) 1939. Horton, B. T.: The Use of Histamine in the Treatment of Specific Types of Headaches. J. A. M. A. 116: 377-383 (Feb. 1) 1941.

The patients treated by the combined method were dismissed with the same instructions as those given to the patients treated by the histamine desensitization schedule alone.

Total individual doses during the period of treatment varied from 0.20 to 6.29 mg. of histamine base when the subcutaneous method of therapy was employed; from 0.44 to 14.02 mg. of histamine base when the intravenous method of therapy was used, and from 0.31 to 7.74 mg. of histamine base when the combined method of therapy was carried out. Irrespective of the route of administration of the drug, the great majority (111) of the patients received a total dose of less than 5 mg. of histamine base.

Series 2.—This series consists of a special group of 20 patients treated during June, July, August and September 1945. Treatment of this group was undertaken to see whether we could duplicate the results of Butler and Thomas.

The method outlined bu Butler and Thomas[1ab] is as follows: A 1:500,000 dilution of histamine base in isotonic solution of sodium chloride is employed. One milligram of histamine base (500 cc. of the solution) is administered intravenously over a four to eight hour period every other day, for four to eight doses. Epinephrine or ascorbic acid is used to control headache or allergic manifestations occurring during the infusion. "Heartburn" is relieved by the administration of alkaline powders.

Epinephrine and ascorbic acid are two naturally occurring antihistamine substances. Clinically, they are effective histamine antagonists. It has not yet been demonstrated how these substances neutralize the histamine effects, whether they neutralize all the histamine effects or what the quantitative relationships are for such neutralizations. For these reasons, neither substance was administered to any patient in series 2 concomitantly with histamine. Reactions were controlled by modification of the rate of administration of the drug, the total dose for the day or both.

Intravenous Administration: Patients in series 2 received by infusion a 1:500,000 dilution of histamine base in isotonic solution of sodium chloride. The initial dose tolerated by the patients varied from 0.03 to 0.07 mg. of histamine base. The maximal single dose was 1.1 mg. of histamine base. All but 1 of the patients received each treatment in a period varying from one and a half to three hours. Patients were treated every day except Sunday. Treatment was continued until the maximal therapeutic effect for the given patient appeared to have been obtained.

Combined Form of Administration: It had been intended to administer histamine by the intravenous route only in series 2. In 8 cases, the results of intravenous administration were either so unsatisfactory or so transient that subcutaneous administration of histamine also was tried. The same schedule of doses was used as in series 1, except that the initial dose varied from 0.005 to 0.035 mg. of histamine base.

The total individual doses during the period of treatment in series 2 varied from 0.20 to 8.40 mg. of histamine base when the intravenous method of therapy was employed, and from 1.34 to 13.80 mg. of histamine base when the combined method of therapy was used. Thirteen patients received a total dose of less than 5 mg. of histamine base. Three patients received a total dose of more than 10 mg. of histamine base.

RESULTS

Results Presented According to Method of Administration.—Response to histamine therapy has been gaged on the basis of a comparison of frequency, intensity and duration of attacks before and after treatment. The results are reported in four groups in which the response of the patient was graded: none to 25 per cent; 25 to 50 per cent; 50 to 75 per cent, and 75 to 100 per cent. This grouping represents improvement during supervised treatment of the patients at the clinic. The fewest failures and the greatest percentage of unquestionable improvements (75 to 100 per cent improvement) occurred among the patients receiving histamine by both the subcutaneous and the intravenous routes.

When one route of administration alone was used, a greater percentage of patients were benefited by subcutaneous therapy than by intravenous therapy.

There is a group of patients showing less than 50 per cent improvement after intravenous therapy whose degree of improvement seems to increase above 50 per cent when combined therapy is employed. Subcutaneous administration of histamine appears to be effective in a wider variety of cases of migraine than is intravenous administration.

Thirty-three per cent of patients did not respond to histamine administered either subcutaneously or intravenously. Twenty-two and seven-tenths per cent of patients did not respond to histamine administered by the combined method of therapy (5 cases out of 22). The pattern of improvement during treatment is similar in both series of cases.

Results Presented According to Method of Administration and Type of Migraine.—On the whole, there was a tendency toward fewer failures and a greater percentage of significant improvements among patients who had atypical migraine than among patients who had typical migraine, irrespective of the route of administration of histamine.

Significant improvement among persons with typical migraine occurred more frequently during the combined method of therapy than during either subcutaneous or intravenous therapy alone.

Of the 124 patients treated in series 1, 41 were judged to have insignificant (none to 25 per cent) improvement during the period of supervised treatment. Twenty-five to 100 per cent improvement occurred in 83 patients. Adequate follow-up data were available concerning 71 of these 83 patients. In series 2, 5 patients were judged to have insignificant improvement during the period of supervised treatment. Of the remaining 15 patients, adequate follow-up data were obtained from 14.

Recurrence Presented According to Method of Administration.—In series 1, data on recurrence were compiled from information volunteered by the patients. The majority of patients did not spontaneously report recurrences until such attacks again had interfered with their daily routine. In series 2, a a questionnaire was sent to all patients, and the first migrainous manifestations, however mild, were considered to be a recurrence of the syndrome.

A third to two thirds of the patients had recurrences within one month of dismissal, irrespective of the route of administration of histamine.

Of those attacks of migraine which recurred within one month, the fewest followed intravenous therapy, and the greatest number followed the combined method of therapy. Careful study of the latter cases showed that the majority of these patients had discontinued injections of histamine of their own accord, within the first month after dismissal. Apparently, they had been lulled into a false sense of security by their response during treatment.

Of the 5 patients in series 2 whose migraine did not recur within one month, 2 had been treated by the combined method of administration and 1 employed histamine subcutaneously at home. The migraine of the remaining patients in series 2 recurred in two and three months, respectively, following intravenous therapy.

Institution of subcutaneous histamine therapy after recurrence of the migraine syndrome has subsequently relieved, in whole or in part, 3 patients in series 2 who received only intravenous therapy while at the clinic.

The only patients for whom a markedly sustained effect (up to three years' duration) was obtained were patients in series 1, treated by the subcutaneous method. The duration of freedom from migrainous attacks parallels rather exactly the duration of administration of adequate maintenance doses of histamine. Patients free of symptoms after one year or more were still taking histamine subcutaneously once daily or every other day.

Recurrence Presented According to Method of Administration and Type of Migraine.—In series 1, irrespective of the route of adminstration of histamine, typical migraine recurred within three months in the majority of patients, whereas atypical migraine tended not to recur until three to six months had passed. The two patients with atypical migraine in series 2 experienced recurrence within one month.

COMMENT

Evaluation of the treatment of migraine is difficult. The results are not objectively measurable. We are dependent on the statements of the patient, both in making the diagnosis and in gaging the effects of therapy.

The frequent coexistence of other types of cephalalgia in a migrainous person is a difficulty more apparent than real. The migrainous person is peculiarly liable to headache, but if the criteria originally used for the diagnosis of migraine are kept in mind, it is possible to follow the transitional forms of migraine, occurring either spontaneously or during therapy, without being confused by coexisting cephalalgias. Because migraine is a syndrome rather than merely a cephalalgia, this is true even as individual components of the syndrome disappear.

Certain points in the present study deserve special comment. The statistical method is obviously limited when it is applied to so subjective a phenomenon as migraine. It should be emphasized that our choice of patients for analysis and study was rigid. In series 1 (the 124 patients seen at the clinic from 1937 to 1945) we were dependent on the records of these patients as noted by others, who at the time of recording could not have known that the present investigation would be made. Consequently, cases have been excluded from our analysis which additional information might have led us to include. Similarly, in some cases a condition which we classified on the basis of available data as "atypical migraine" may in reality have been typical migraine. We are certain that we have included no nonmigrainous cephalalgias; it is possible, however, that in some instances less severe migraine has been excluded because of lack of complete data.

The majority of patients treated in these two series had more than one type of cephalalgia. The usual concomitant was tension headache. Five per cent of our patients previously had become addicted to the use of opiates, which, in themselves, may cause headache. We should like to say that morphine and all habit-forming drugs have absolutely no place in the treatment of migraine. Although we have reported only the migrainous cephalalgia in these cases, the coexistence of another type of headache lowers the threshold for migrainous attacks and hence increases resistance to therapeutic measures.

Because the majority of our patients came from a long distance and had to stay away from home two weeks or more in order to undergo treatment, it has occurred to us that we might have seen chiefly more severe migrainous cephalalgias. To a certain extent, this probably has been true.

With these points in mind, we may turn to a comparison of our figures with others in the literature. The only detailed reports on the treatment of migraine with histamine are those of Butler and Thomas.[3] These authors administered histamine by both the intravenous and the combined routes; in addition, they used a combination of histamine administered intravenously and histamine-azoprotein[4] ("hapamine" administered subcutaneously. In a series of 75 cases, 88 per cent of the patients experienced partial or total relief of their migrainous cephalalgias. Forty-five per cent of the patients experiencing relief had no recurrence from eight months to two years after treatment. Only 16 of the patients reported on by Butler and Thomas received either histamine or "hapamine" subcutaneously.

These figures are significantly different from ours. When the several points enumerated herein are considered, it is seen that differences in response of the patients during treatment may be more apparent than real. However, it is more difficult to reconcile the two groups of figures on recurrence. The only patients in our series whose migraine eventually did not recur were still taking histamine subcutaneously. In series 2, in which the follow-up study was most complete, 19 or 20 patients have had recurrences, and the twentieth did not report. It has been our experience that although recurrent attacks may be minor at first, they ultimately tend to return to the severity which prevailed before treatment unless more histamine is administered. This apparently has not been true in the cases reported by Butler and Thomas.

Can we attribute the differences in figures on recurrence to variations in technic of therapy in the two groups of cases? We used neither epinephrine nor ascorbic acid concomitantly with histamine, and although our total doses were as large as, or larger than, those of Butler and Thomas, our over-all period of treatment usually was longer. In other words, is the effectiveness of treatment proportional to the size of the total dose of histamine base per unit of time, irrespective of concomitant neutralization of the overt effects of histamine with antihistamine substances? This is a theoretic possibility which deserves consideration.

SUMMARY AND CONCLUSIONS

Records of 144 migrainous patients treated with histamine alone at the clinic between the years 1937 and 1945 have been reviewed. The migraine syndrome in 23 to 33 per cent of the patients was unchanged after histamine therapy, irrespective of the route of administration of the drug. Intravenous administration of the drug was found to be the least effective method of histamine therapy in the treatment of migraine. The syndrome of 33 to 50 per cent of patients with typical migraine and that of 40 to 66 per cent of patients with atypical migraine showed significant improvement during the period of treatment by this method. The subcutaneous administration of histamine was found to be effective in a wider variety of cases of migraine than was the intravenous administration of histamine. Approximately 60 per cent of migrainous patients, irrespective of the type of migraine, showed significant improvement during the period of treatment by this method. The administration of histamine by both the intravenous and the subcutaneous route was found to be the most effective method of histamine therapy in the treatment of migraine. Seventy to 85 per cent of patients with typical migraine and 75 to 100 per cent of patients with atypical migraine showed significant improvement during the period of treatment by this method.

Of the 88 patients who exhibited improvement during the period of treatment and concerning whom follow-up data were complete, 85 experienced a recurrence of migrainous attacks when histamine therapy was decreased below an individual critical level or was stopped entirely. The 3 patients whose migrainous attacks did not recur were still taking histamine at the time of their reports. A tendency was noted for typical migraine to be more refractory to treatment with histamine and to recur sooner after such treatment than atypical migraine.

There appeared to be no constant relationship between the total dose of histamine base and the degree or duration of abatement of the migraine syndrome. There appeared to be no constant relationship between the size of single tolerated doses of histamine base and the recurrence of a migrainous attack. It was found that migrainous patients, in general, tolerate ten times more histamine base in a single dose administered by the intravenous route than in a single dose administered by the subcutaneous route. In migrainous patients there appeared to be a qualitative as well as a quantitative difference between the effects of histamine administered intravenously and the effects of histamine administered subcutaneously.

The use of histamine may prevent some attacks of migraine in some cases. The duration of such an effect seems to parallel the duration of administration of adequate doses of the drug. Adequate dosage varies with the individual patient

Although histamine was not found to be either a specific or a truly curative agent in the migraine syndrome, until such an agent appears, histamine will continue to have a place among the prophylactic measures of value in the clinical management of the migrainous patient.

POTENTIATION OF PRESSOR ACTION OF EPHINEPHRINE BY TETRAETHYL AMMONIUM

GORDON K. MOE, M.D.
Ann Arbor, Mich.

In a recent note in THE JOURNAL, Page and Taylor[1] warned against the use of epinephrine in vascular collapse induced by overdosage of, or unusual sensitivity to, tetraethyl ammonium. They observed that tetraethyl ammonium potentiates the pressor action of epinephrine and of angiotonin and postulated that this potentiation may be due to an action on the enzyme systems which destroy these agents or to an "explosive manifestation of sensitization of denervation." There is no doubt that tetraethyl ammonium is capable of potentiating the responses to pressor drugs; it also potentiates responses to depressor drugs. It is necessary, however, to point out the difference between intravenous administration of epinephrine in dogs and subcutaneous administration in human subjects and also to suggest a more likely explanation of the mechanism of potentiation.

When epinephrine is injected intravenously in small doses, the dog under anesthesia responds with a fall of arterial pressure. When larger doses are administered, arterial pressure rises and the buffer reflexes are called into play in an effort to prevent the pressure change. The compensatory mechanisms which are available to combat an acute rise of blood pressure are (1) reflex slowing of the heart, including increased vagal tone and reduced accelerator tone, (2) increased vasodilator tone (the nature and importance of which is not well defined) and (3) reduction of vasoconstrictor tone. If the dose of epinephrine (or other pressor agent) is sufficiently small, these reflex adjustments, particularly the last named, will quickly restore the normal level of pressure. These reflex mechanisms, however, involve autonomic pathways and will be prevented by any agent which interrupts autonomic impulses. It would be predicted that tetraethyl ammonium would potentiate pressor responses to the same degree, and for the same reasons, as destruction of the medulla and spinal cord.

Compensation for the effects of depressor drugs will set off reflex adjustments of opposite nature: cardioacceleration and increased vasoconstrictor tone. These autonomic mechanisms will likewise be blocked by tetraethyl ammonium, and the depressor responses will be potentiated.

The accompanying figures illustrate that the mechanisms predicted do indeed operate in anesthetized dogs. In figure 1 is shown the effect of epinephrine on arterial pressure and femoral arterial blood flow in a dog, before and during a continuous infusion of tetraethyl ammonium. The first dose of epinephrine, 0.01 mg., caused a brief pressor response, for which the animal compensated almost completely. Femoral flow increased, reaching its highest point at a time when the pressure had returned to the initial level; the resistance of the femoral vascular bed was reduced at this point, as the result of reflex inhibition of vasoconstrictor tone. During the infusion of tetraethyl ammonium, epinephrine produced somewhat greater pressor responses. The actual increase and the percentage increase were much greater than in the control period, in part because the pressure rose from a lower base line, but chiefly because the compensatory reflexes had been blocked. After an initial increase in blood flow (a passive response to the increasing pressure before the injected epinephrine reached the femoral vessels), the femoral flow decreased to reach its lowest level at the peak of the pressor response; the resistance of the femoral vascular bed was increased.

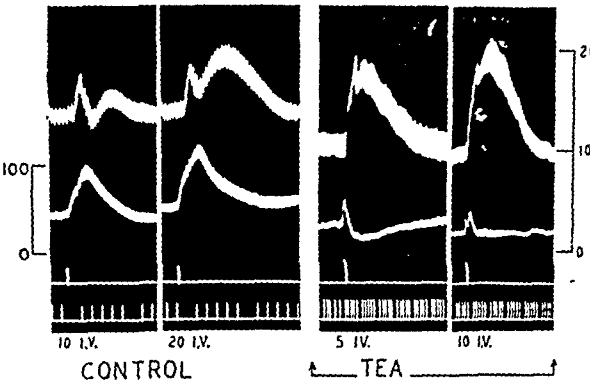

Fig. 1 (dog, 14 Kg., sodium barbital anesthesia).—The upper curve shows carotid arterial pressure (scale at right); the lower curve shows femoral arterial blood flow (scale at left in cubic centimeters per minute). Time in 10 second intervals. At signals, epinephrine was given intravenously (total dose in micrograms). The first two segments are of the control period and the second two during infusion of tetraethyl ammonium, 20 mg. per kilogram of body weight per hour.

Figure 2 illustrates reflex vasoconstriction induced as a result of the depressor response to glyceryl trinitrate. During infusion of tetraethyl ammonium, the depressor action of the vasodilator drug was potentiated, because reflex vasoconstriction in the leg was prevented.

It does not seem necessary, then, to assign the potentiating action of tetraethyl ammonium on the pressor actions of epinephrine and angiotonin to any action on the liver, to inhibition of amine oxidases or to any obscure mechanism of denervation sensitization. The action is completely explained in terms of blockade of compensatory reflexes. It follows that tetraethyl ammonium cannot further potentiate the action of vasoconstrictor drugs when the chief compensatory buffer mechanism, neurogenic vasoconstrictor tone, is already at a minimum. This can be demonstrated in the pithed cat, in which tetraethyl ammonium does

not appreciably alter the pressor action of epinephrine.

The blood pressure responses to tetraethyl ammonium suggest that the normal human subject, unlike the dog, has little vasoconstrictor tone in the horizontal position (except to the skin, where blood flow is probably largely under the control of thermoregulatory rather than pressuregulatory centers); the ability of such persons to compensate for epinephrine action is therefore sharply limited, and tetraethyl ammonium will not produce prominent potentiation. In studies of the action of tetraethyl ammonium on the gastrointestinal tract,[2] epinephrine has frequently been injected subcutaneously in doxes as high as 1 mg., in subjects under the influence of full clinical doses of tetraethyl ammonium. No untoward effects were observed. Absorption from a subcutaneous injection site is so slow that abnormally hypertensive responses to epinephrine are unlikely.

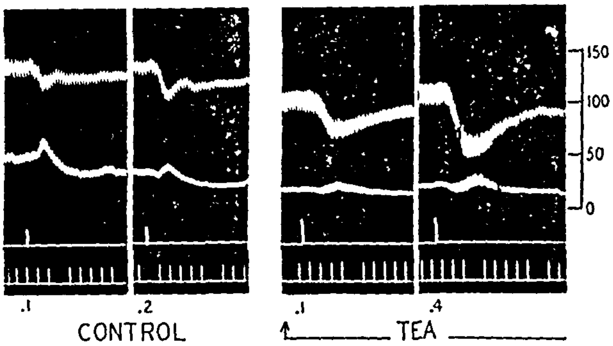

Fig. 2 (same dog as in fig. 1).—At signals, intravenous injections of glyceryl trinitrate were given: 9.1, 9.2, 9.1 and 9.4 mg. total, before and during infusion of tetraethyl ammonium.

Epinephrine should never be given intravenously, with or without tetraethyl ammonium, unless the blood pressure is carefully watched and the dosage adjusted to meet the needs of the patients. In a few subjects who responded to tetraethyl ammonium with severe and prolonged hypotension, the blood pressure was restored to adequate levels and maintained there by the intravenous infusion of epinephrine in dilute concentration. No undesirable hypertensive response occurred, for the infussion rate was, of course, under minute to minute control.[3]

The warning advanced by Page and Taylor should apply to any injection of epinephrine, which should always be given cautiously, and should not imply any special contraindication to or hazard in use of tetraethyl ammonium. Others incurs any special contraindication or hazard.

Assay of Vitamins.—For each of the B-vitamins known to be required for growth of animals, there are thus known several different micro-organisms which also require that vitamin for growth . . . It is from such procedures, used to identify the growth factors essential for the various test organisms, that our present microbiological assay methods have developed.—Snell, Esmond E., Physiological Reviews, April 1948.

RESTORATION OF LONG BONE DEFECTS WITH MASSIVE BONE GRAFTS

CARLO SCUDERI, M.D.*
Chicago

Bone grafts have been utilized successfully for approximately forty years. However, it was not until World War I that bone graft surgery actually reached the plane of efficiency to be of great utilization in the repair of bone disease and bone defects secondary to trauma. At the termination of World War I, America found itself with a large number of persons who required repair of the long bones of the extremities in order to rehabilitate these people back to civilian life. The same was true in the European countries. From this experience many of the basic principles of bone graft surgery were developed to such an extent that little has been added mechanically to the technic of bone graft surgery until the beginning of World War II.

In the interval of approximately twenty years numerous men have perfected certain types of gadgets or pieces of equipment which materially helped in some of the finer bits of carpentry that are frequently necessary for good bone graft surgery. No real epochal progress was made nor was any major contribution proposed until World War II began. At this time as a result of the advent of chemotherapy, orthopedic surgeons had a valuable adjunct to their armamentarium for the repair of bone defects. By the use of the sulfonamide drugs and penicillin, reconstruction work could be done in extremities which had previously had suppuration, with a minimal recurrence of infection in the operative area. It is known definitely from experience in civilian life, prior to World War II, that many successful operations have been done on extremities during and after the termination of World War II which prior to the advent of chemotherapy would have definitely been failures.

With the tremendous advance made in mechanical warfare, and with highvelocity explosives, land mines, booby traps, airplane accidents, jeep accidents and innumerable types of accidents produced by other motor vehicles, there were more casualties during the recent conflict than had ever been known to man.

The Surgeon General's Office deserves the greatest credit for having foreseen the great number of casualties that were to come and for placing in the large general hospitals in the Zone of the Interior men of known orthopedic ability from civilian life to take care of these casualties. In many instances, some of these men remained in one installation for a matter of two, three and four years. Many of their assistants were persons who had remained in the same installation for many months, and frequently the surgical nurses operated every day with the same surgeons, month in and month out. Naturally, with such splendid operative cooperation, these surgical teams did work of a quality and quantity that was previously unknown. Many a man has returned to civilian life after having been injured in World War II owing his entire rehabilitation to the excellent judgment used by the Surgeon General's Office and the fine clinical work by the surgeons in these large installations.

*Associate Professor of Surgery, University of Illinois; Former Colonel, Medical Corps; Attending Surgeon, Cook County Hospital and St. Elizabeth Hospital.

Read before the Section on Orthopedic Surgery at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 13, 1947.

Had it not been for the splendid first aid and emergency treatment that was rendered overseas, a great many of these persons would never have survived the original trauma or, if they had survived, would have lost the extremity and would not have returned to the Zone of the Interior for any form of operative orthopedic reconstruction work except for the fitting of a prosthesis. The medical profession can well be proud of the splendid work done by the men who were in the armed forces.

This paper is on 94 cases in which I personally operated while chief of orthopedic surgery at McGuire General Hospital in Richmond, Va. Four cases were known failures, 3 due to recurrence of infection in the operative field and 1 due to a double fracture of the massive bone graft of the fibula, which later required a second tibial graft. Whether some of these repairs which were considered successful broke down in other installations after the patients had been transferred is unknown to me, but up until the time that the last patient had been under direct observation for at least two months prior to transfer, the recurrent infections were only three. Considering the severity of the damage to the soft tissue, the extent of the bone loss and the fact that all of these injuries were compound wounds, the results are formidable.

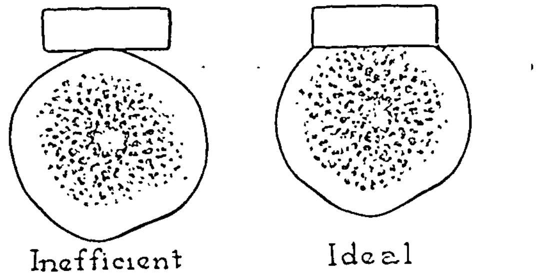

Fig. 1.—The maximum bone contact is desired between the graft and the host bone.

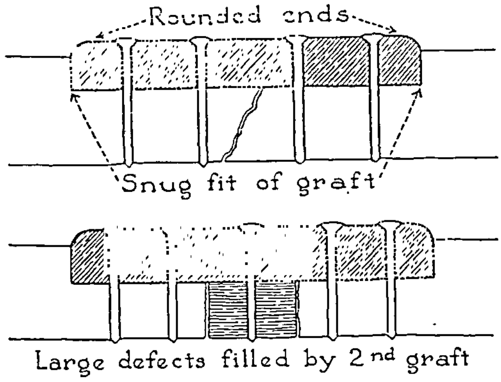

Fig. 2.—A snug-fitting, well morticed bone graft which conforms to the general contour of the injured bone is theoretically and practically most desirable.

PREOPERATIVE REQUIREMENTS

It has long been well known that no form of reconstructive surgical treatment of bone can be performed in the presence of an actual infection. Occasionally men who have attempted this procedure have been successful, but the operative risk is so high that most men have not felt that this is the correct procedure to be undertaken in this type of work. In civilian life, prior to chemotherapy, nine to twelve months were the usual period of time that was permitted to elapse before any bone grafting was performed in a wound that had previously suppurated.

Three preoperative requirements I have felt to be most essential: 1. No drainage should be present in a wound for a minimum of three months prior to the date that bone grafting is performed. 2. Good skin and subcutaneous tissue must cover the operative field where the operative intervention is to be performed; otherwise the bone graft will not survive. In order for the graft to become vascularized and throw out callus and become an integral part of the host bone, it is necessary to obtain its blood supply from the surrounding tissues. If this tissue is scarified and the blood supply is poor, the chances that the bone graft will become revascularized are minimal, and in many instances the bone graft terminates in acting as a foreign body. Fortunately, in most general hospitals in the Zone of the Interior plastic surgeons were available, and large defects could be filled with good healthy skin and subcutaneous tissue by means of

either a swinging graft from the surrounding area or a pedicle graft from the opposite extremity or the abdomen. Padgett's dermatome has been a most valuable asset in the covering of granulating wounds, thereby shortening the period of wound healing. 3. Adequate chemotherapy is most essential, before and after the operation, in order to insure a sterile field at the time of operation. Penicillin was used in amounts of 25,000 units every three hours, and 90 grains (6 Gm.) of sulfadiazine a day was given in divided doses forty-eight hours prior to surgical treatment and for fourteen days postoperatively, until all the sutures were removed and the skin was found to be healed by primary intention. It was my impression that under the screening of sulfadiazine and penicillin these cases did far better than similar cases in civilian practice.

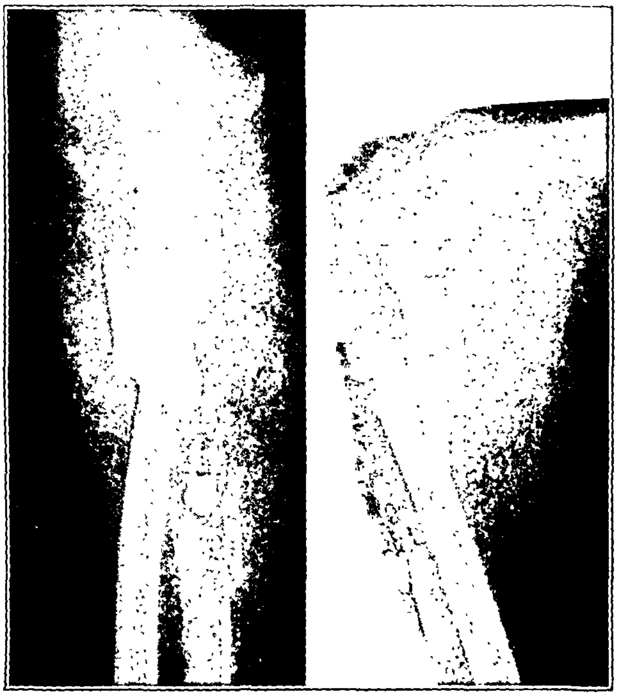

Fig 5.—A private first class, injured Feb. 25, 1945, with resulting malunion of radius and loss of bone substance of the ulna.

TYPE OF BONE GRAFTS USED AND THEIR INDICATIONS

The type of bone grafts used were three, as follows:

1. Tibial bone grafts were used to restore the general configuration of long bones when length of bone and mechanical stability were necessary. In cases in which mechanical strength was important, such as in the shaft of the humerus or the femur, the crest of the tibia was utilized, in spite of the fact that the removal of the crest had the tendency to weaken the tibia. In cases that required length of bone with little mechanical strength, the central portion of the tibia was used from the flat surface. This type of graft was found to be most *suitable for restoration of defects of* the radius and ulna and also for sliding grafts of the tibia.

2. Full thickness fibular grafts were used successfully in a number of cases, up to 8 inches (20.3 cm.) in length being used from the central portion of the fibula. In spite of the fact that numerous men have condemned the fibular graft, stating that it is too large a piece of bone to become revascularized, none of my fibular grafts broke down except in 1 case in which gross infection occurred from the sloughing out of the overlying skin. In some cases the fibular graft was used in conjunction with the tibial graft in order to restore a large defect existing in a femur.

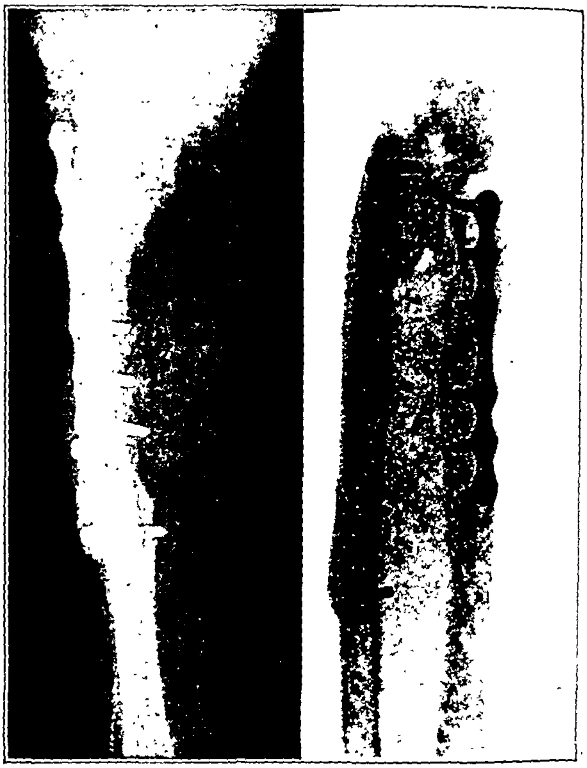

Fig. 6.—Same patient as in figure 5. End result, four and one half months after operation, after a plating of the radius and a *tibial graft* to the ulna.

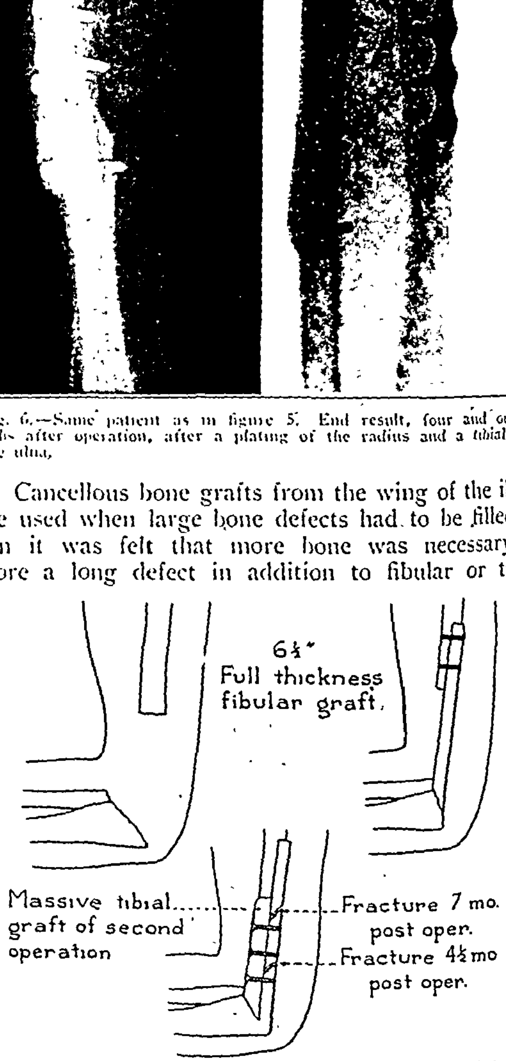
3. Cancellous bone grafts from the wing of the ilium were used when large bone defects had to be filled or when it was felt that more bone was necessary to restore a long defect in addition to fibular or tibial grafts. These cancellous bone fragments were packed around the bone defect, and it was found that in these cases early callus was produced and a much earlier restoration of healthy bone than with massive cortical bone. However, mechanical stabioity, which is so essential in many cases, was lacking.



6¼"
Full thickness
fibular graft.
Massive tibial graft of second operation
Fracture 7 mo. post oper.
Fracture 4½ mo post oper.

Fig 7.—A first sergeant, injured June 1, 1944 with loss of 4 inches (10.2 cm.) of humerus, proximal ½ inch (1.3 cm.) of radius and 1½ inches (3.8 cm.) of the ulna

In some cases a combination of the three aforementioned grafts were used, depending on the type of defect that had to be filled and the mechanical stress and strain which the host bone would be subjected to during an active life.

In order to obtain the greatest number of takes in bone grafting, it is most essential to follow a number of basic principles of carpentry plus the basic physiologic principles of revascularization of tissue. If one hopes to obtain early revascularization of bone, it is most important that the grafted bone be firmly fixed to the host bone so that it has a solid base from which the finer vessels can grow and revascularize the contact surfaces of the bone. In addition, the more fresh bone that is brought in contact with the grafted bone, the better are the chances of a successful take. For this reason it is felt to be a most important point that the grafted bone be fitted into a definite well formed bed that fits the conformation of the graft or that the graft be made to fit the conformation of the bed, so that the sides and base of the graft have the maximum amount of fresh bone contact. For the portion of the graft that lies exteriorly, it is essential that good healthy muscle or subcutaneous tissue be drawn over the graft so that the periphery has an opportunity of becoming revascularized as well as the central portion of the graft. No form of stability of the graft to the host bone is as efficient as the use of mechanical screws. The Surgeon General's Office did a splendid job of standardizing the metals and type of screws to be used in the armed forces, and these screws were of uniform chemical composition and of uniform thread and diameter size so that once the mechanical side of the problem was standardized, the fixation of screws became simple.

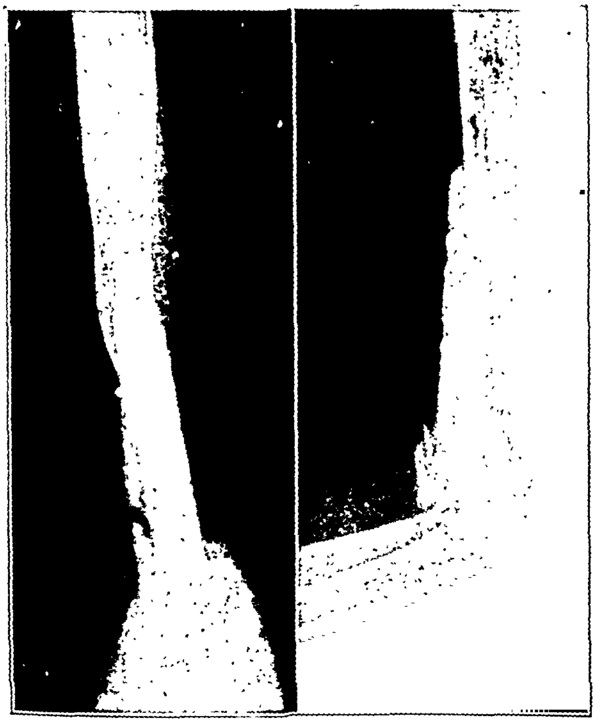


Fig. 8.—Same patient as in figure 7. End result after a double fracture of a full thickness fibular graft, followed later by a tibial graft which successfully stabilized the area End result fifteen months after the fibular graft, and seven months after the tibial graft.

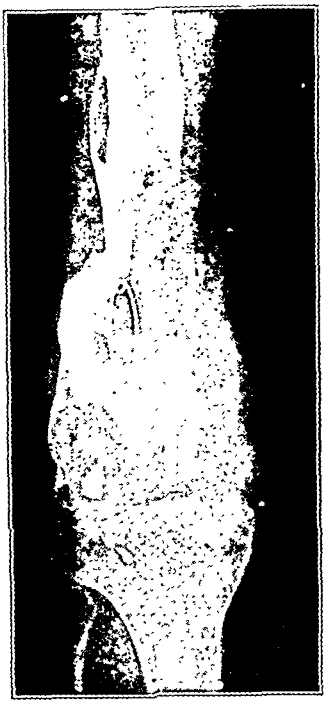

Fig. 9.—A private first class injured Dec. 2, 1944 with loss of bone substance of femur and a septic arthritis of the knee.

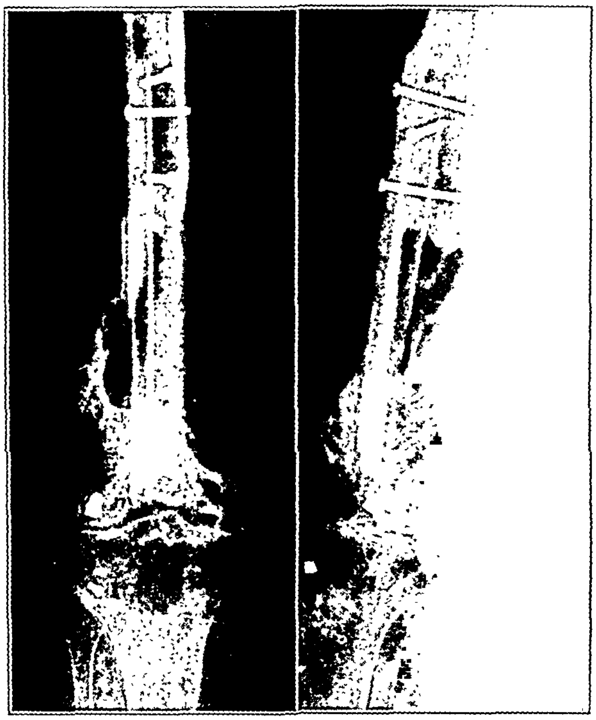

Fig. 10.—Same patient as in figure 9. End result of a full thickness fibular and tibial graft 7 inches (17.8 cm.) long, fourteen months after surgical treatment

The general conformation of the grafted bone must by necessity tend to reestablish the normal contour of the host bone. By so doing there is the least amount of interference with the overlying muscles and tendons during their action in the locomotion of the extremity. Sharp corners are to be avoided, and bulky masses of bone directly below the skin and subcutaneous tissue are most harmful and do not do well as far as revascularization and viability are concerned.

POSTOPERATIVE CARE

The postoperative period constitutes a most critical phase in this type of surgery. Unless careful postoperative immobilization is instituted, the fracturing of the graft or the loosening of the screws occurs all too frequently. This spells failure. It is most important that there be firm, adequate immobilization for a sufficient period. Perhaps no form of immobilization is as satisfactory as plaster of paris. Casts can be molded to the contours of the body and firmer immobilization obtained than by the use of any other form of external fixation.

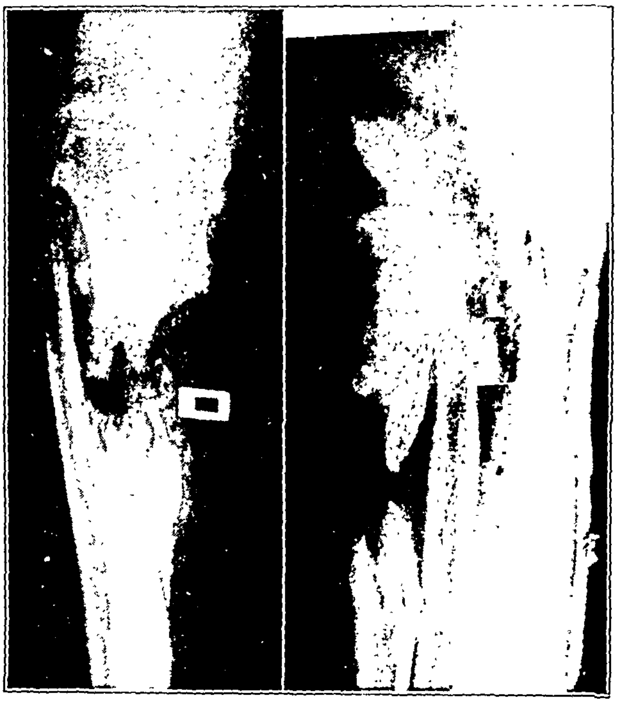

Fig. 11.—A private injured by shrapnel fire with loss of the left leg, lower third of femur. Right leg had loss of 2 inches (5.1) cm.) of tibial substance with intact fibula. A split thickness graft covered the soft tissue defect.

The period of immobilization is much longer than one is apt to believe at first. For this reason it must be remembered that long immobilization is most important and that many a good graft has been lost because of the overenthusiasm and optimism of the operating surgeon.

Where good carpentry has been utilized in performing bone grafts, practically no extraosseous callus becomes visible. The only sign of a take of the graft is the loss of the margins of the graft and the gradual homogenous appearance between the bed of the graft and the host bone. After a period of time this line of separation completely disappears. It requires a great deal of skill and clinical experience to interpret correctly from the roentgenograms and the clinical observations of the extremity whether the graft has taken well enough so that immobilization can cease. It is far safer to err on the side of prolonged immobilization.

CONCLUSIONS

With the advent of chemotherapy, the results of massive bone grafting are far superior to the results prior to the use of sulfonamide drugs and penicillin. More extensive operative procedures can be undertaken with chances of success than could have been undertaken prior to World War II. In order to obtain the best mechanical advantage for the take of the bone graft, it is most important that the maximum amount of fresh bone be brought in contact with the grafted bone and that a snug fit be made between the bed of the host bone and the graft that is to fit into this area. This firm internal immobilization is best obtained by the use of metal screws. Long immobilization in plaster is most advantageous if one is to avoid the all too frequent complication of loosening of the screws or fracturing of the graft. Under no circumstances should a bone graft be placed into scar tissue or covered by skin that does not have a good vascular bed and adequate subcutaneous tissue.

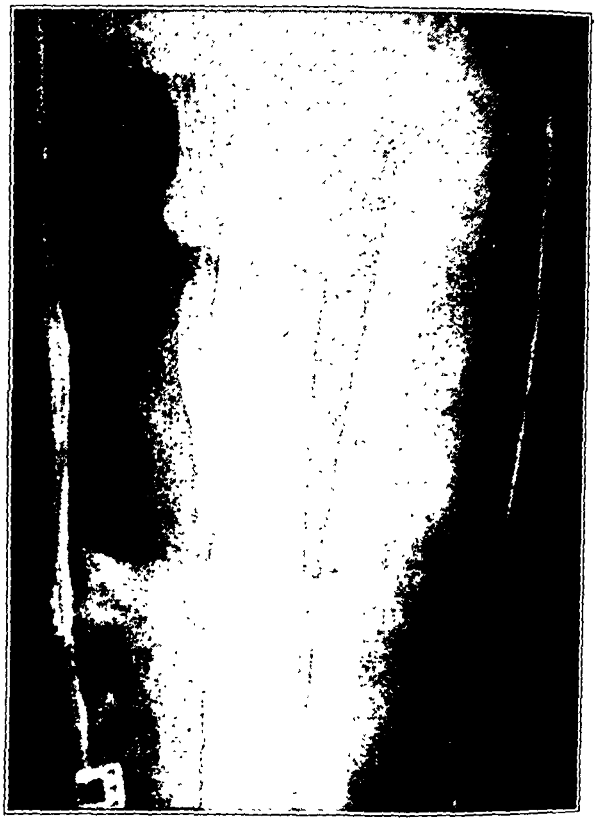

Fig. 12.—Same patient as in figure 11. A 3 inch (7.6 cm.) of fibula was resected and used as an intramedullary bone graft, fixed with two screws to prevent distraction of the freshened tibial fragments. This procedure permitted obliteration of the tibial defect. The dermatome graft was removed, and normal skin and subcutaneous tissue could now be drawn over the bone; the soldier, instead of being 6 feet 3 inches (190.5 cm.) in height was now an even 6 feet (182.9 cm.).

The general conformation of the grafted bone to the host bone is most essential and all sharp corners are to be avoided, as they interfere with the activity of the overlying muscles and tendons and also contribute to the production of excessive scar tissue and unnecessary pain to the patient.

Considering the severity of the wounds and the extensive damage that was produced to the extremities in World War II, the results of bone grafting have been most gratifying.

ABSTRACT OF DISCUSSION

Dr. T. C. Thompson, New York: There is little to add to the clear and comprehensive presentation given by Dr. Scuderi. A series of 94 cases of bone transplantations with only one refracture and three infections is indeed remarkable. Although some of the credit must be given to sulfonamide drugs and penicillin, the high percentage of excellent results indicates that not only were the technical procedures good but the surgical judgment must have been unusually sound. The treatment of uncomplicated nonunion has become a relatively simple matter and one in which one should obtain almost 100 per cent good results. The treatment of the complicated cases with extensive loss of bone and soft tissue test the patience and ingenuity of the best surgeon. I put patience first, for, even though one does not need to wait for many months after infection has subsided, it is most desirable that all the parts of the extremity be brought back to as nearly normal conditions as possible before a reconstructive operation is performed. Not only should the skin be good but all remaining muscle power should be completely developed by maximum functional use of the extremity. It is obvious that Dr. Scuderi does not use the same type in all cases. I agree that firm fixation with a large area of contact between the viable bone and the transplant is most desirable. The technic of making the holes larger in the superficial cortex and using screws long enough to engage the opposite cortex is an excellent way to accomplish this. In some of the most difficult cases, the time required to obtain stability in an extremity without danger of refracture can be shortened and risk of losing a badly damaged extremity can be avoided by the use of a simpler method than a massive bone transplant. After extensive loss of the radius there is pronounced radial deviation of the wrist when the ulna is still intact. Full length cannot be obtained with the use of a massive graft and the bone has to be placed in a scarred bed where the circulation is precarious. I have seen many of these patients in whom the procedure has been a complete failure. Even if it is successful, there are usually little pronation and supination of the forearm and the wrist deformity remains, unless the ulna is shortened at the same time. This problem can be simply solved by making a one bone forearm, accepting the fact that pronation and supination cannot be restored. An osteotomy of the ulna just above the wrist and a transplantation of the wrist and hand to a good position on the end of the ulna will give a cosmetically and functionally good forearm, which is strong in a matter of weeks instead of months. The same thing can be done for a large gap in the tibia, which is almost invariably followed by a varus deformity of the ankle and foot. This deformity can be corrected by a complete osteotomy just above the ankle with transplantation of the foot outward beneath the fibula. Union of the fibula to the tibia above the site of the defect can be readily obtained through an incision which is not through the badly scarred site of injury. Cancellous bone can be added if needed. The perfect alinement obtained in this way allows early weight bearing, and solid healing is obtained in much shorter time than when a massive graft has been used. Attempts to perform technically difficult surgical procedures at the wrong time have resulted in a considerable number of failures. Extensive loss of bone is not an indication for amputation, and certainly attempts to repair such loss should not result in amputation.

Dr. Jesse T. Nicholson, Philadelphia: Dr. Scuderi has had an unusual opportunity to observe a big series of long bone defects. He has discussed well an involved subject in the brief time allotted. The outstanding contribution on the use of autogenous bone grafts for nonunion in long bones that evolved from the first world war was written by the Surgeon General, Norman Kirk. In World War II chemotherapy and antibiotics made surgical treatment possible at a much earlier date after injury and usually prevented a flare-up of infection. This advance not only eliminated infection as a cause of nonunion, but resulted in earlier bone grafting, thus preventing the bone atrophy which so frequently complicated the cases of long-standing infection. The other causes of failure also have been minimized with better immobilization methods, improved bed care, technic of obtaining roentgenograms and ability to combat shock with available whole blood and plasma reserve. Other advantages that favored early successful grafts have been the use of split skin graft to cover soft tissue defects, thereby preventing scarring and obtaining rapid wound healing, then the later substitution of full thickness graft to insure adequate coverage for the proposed bone graft. I cannot agree with Dr. Scuderi on the use of the crest of the tibia as a graft. First as a bone graft it must not be relied on for strength of immobilization. As the graft becomes viable and as creeping substitution (so aptly termed by Dr. Phemister) takes place, the supportive value of the graft is gone. Secondly, it has been my misfortune to inherit subjects from whom a tibial crest had been taken for a graft. Frequently they had had a fracture and even a nonunion of the donor area, or else they had to be kept from weight bearing because of danger of fracture. Often this danger persisted even after the host area had united. Dr. Scuderi's points on the fixation of graft are well presented. The value of small cancellous chips for filling in defects or iliac grafts in the bones of the forearm, metacarpals and metatarsals cannot be emphasized too much. More stress might be put on the preservation of the periosteum of the host bone so that it may be closed, or partially closed, over at least the ends of the graft bridging the defect. Immediate and absolute immobilization is necessary after surgical treatment. I would not even put faith in a tibial crest as support for fourteen days after operation. Dr. Scuderi is correct that no definite time for union of a graft can be given. The roentgen examination is always the answer to the question, "Is there union?"

Dr. Carlo S. Scuderi, Chicago: In response to Dr. Thompson's remarks, I wish to state that it never occurred to me that the ulna could be used to replace the shaft of the radius and give a substantially good forearm. It is an idea that I am going to take home with me, and if the opportunity presents itself, I am certainly going to use it. In regard to Dr. Nicholson's remarks, for brevity of the paper, I did not go into the details about the use of massive fibular grafts. If much strength and length of bone is needed tibial grafts are indicated. Cancellous bone grafts are indicated when large defects are to be filled in conjunction with massive bone grafts. Fibular grafts are indicated when long tubular bone replacement is necessary, such as in the radius, ulna and humerus. I am sorry that time did not permit a more extensive discussion of all the points which we hoped to cover.

WHAT CAN ONE DO FOR THE HARD OF HEARING?

A Panel Discussion

FRANCIS L. LEDERER, M.D., Moderator
Chicago

The Moderator: Each one of you is expected to direct pointed questions and discussions. I hope that this will be the culmination of the problem as a result of the studies that have come about through the military services. I believe that this first showing before a public medical audience of a film produced by the Army will serve as a fair introduction and focus your interest on the problem.

FILMS ON REHABILITATION

Dr. Norton Canfield, Veterans Bureau: The film is the end result of a request of the Surgeon General to provide a pictorial history of the rehabilitative program as carried out in the Army during the War. This film was started about a year and a half ago, before the Army units were rearranged and before the unit which is now in operation at the Army was established at Walter Reed Hospital. The film depicts the course through which these men pass during their rehabilitation program, and is an accurate record of what was done.

"FITTING" THE HEARING AID

QUESTION: What procedures are involved in a really satisfactory hearing aid "fitting?"

Miss Eva Thompson, Philadelphia: In a discussion of hearing aids and "selection," "fitting" or "prescription" of hearing aids, it is essential that the hard of hearing patient be the first consideration. The goal in audiologic rehabilitative procedures is to give the handicapped person some means of maintaining comfortable communication in a gregarious world. This is not a simple thing to do and except in the rare case cannot be done by merely "hanging" a hearing aid on the patient.

Medical and Psychosocial Analysis of Patient.—The first consideration in a really satisfactory hearing aid "fitting" is a complete medical and psychosocial analysis of the patient. As

---

Presented before the Section on Laryngology, Otology and Rhinology at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City N. J., June 13, 1947.

no two persons are alike, it is impossible to know to what degree their hearing loss has influenced their personality. Each in his own way has endeavored to adjust to his hearing loss; some by trying to bluff, and others by becoming introverts. However done, the result is always some form of change in personality. The clinical information necessary is of course derived from as complete an audiologic study as possible, consisting of air conduction and bone conduction audiograms, speech reception tests, tuning fork tests, conversational and whispered voice tests and any special tests which may be indicated. The more tests that are done, the more assurance one has of knowing the actual degree and type of the hearing loss. Each test serves a purpose, but the importance of each must be carefully weighed. Some are merely rough screening tests, and others precision tests. None are completely objective, so that it is impossible to divorce the individual patient from his ears. For example, the audiogram gives a picture of the patient's residual hearing for pure tones. The speech reception test tells what he does with this residual hearing, and this will be reflected in his use of a hearing aid. A thorough otolaryngologic and general physical examination is essential, for no patient should be burdened with a hearing aid if medical or surgical treatment can cure the deafness. There is, however, no contraindication to the use of a hearing aid while therapeutic treatment is being carried out. Helpful information relative to the fitting of a hearing aid is the diagnosis and cause of the deafness and the duration, for this sheds light on the prognosis of the case. In selecting the amount of amplification necessary for the case, this prognosis should be considered. The patient's age and the duration of the hearing loss are of extreme importance in regard to tolerance of amplified sound. An elderly person who has had a hearing loss for a period of years will usually have low tolerance for amplified sounds and will lack the patience and resiliency necessary to learn to listen again. This type of patient often expects the hearing aid to bring back the mental alertness of youth, and when this miracle does not occur he blames the hearing aid. Because of these factors in these cases, often it is better to give less amplification than is indicated by the test picture. This is spoken of as "underfitting," a generally poor practice except in the case in which tolerance for amplified sound is low. The condition of the external canals and tympanic membranes must be known, for it is necessary to take an impression of the external canal in order to make an individually molded ear piece. This is absolutely essential if an air conduction hearing aid is to be used, for no universal ear piece is satisfactory. The impression should never be taken in the presence of mycotic infection, exostoses, active suppurative otitis media or a similar condition which might be a contraindication to the use of an air conduction hearing aid. The presence on absence of tinnitus, vertigo and headaches may also be factors in the patient's adjustment to the use of a hearing aid and, consequently, should be considered in the selection of a suitable aid.

Psychologic Preparation of Patient.—If the hearing loss is greater than 30 decibels in the speech frequency range, audiometrically or as tested by speech reception, a hearing aid should be recommended and the patient advised not only of the advantages but also of the limitations of a hearing aid. All too frequently he believes that an aid is going to be a panacea for all his difficulties and that he need merely overcome the feeling that a hearing aid is a stigma of the infirmity of old age. Hearing aids cannot give the patient completely normal hearing inasmuch as only one ear is being used and difficulties, such as localization of sounds, typical of the unilaterally deafened, must be accepted. Then, too, the hearing aid amplifies all sounds, not just speech, and unless these facts have been clearly explained to the patient before the fitting of the hearing aid he will be confused and disappointed and may even refuse to use an aid. For these reasons the psychologic preparation of the patient is imperative in a really satisfactory fitting of the hearing aid. This can be done by an audiologic specialist, an otologist or a psychologist. Rare indeed is the hearing aid salesman who has had adequate training to play this important role. A general consideration of the patient's vocational, social and economic situation is helpful, as this knowledge may shed light on the degree of the handicap in the patient's daily communicative habits. No patient can be made to use a hearing aid if he does not so desire. Cooperation of the patient must be obtained before a successful fitting can be achieved.

Ear Mold.—The next step is the procurement of a well fitting ear mold for the ear on which the aid is to be worn. The impression for this mold can best be done by the otologist. However, it is accepted practice to have it done by trained technicians. With the use of the new acrylic resins it is a fairly simple procedure and lacks the risk that was present with the use of plaster of paris.

Selection of Ear.—If there is an average moderate loss in both ears and the patient can use a telephone with some efficiency the ear not used in telephoning is selected. If there is a disparity between the ears—for example, an average loss in the better ear of 40 to 50 decibels and a loss of 65 or more decibels in the poorer ear—the better ear is selected. The hearing in the aided ear must be above the level of hearing in the better of the two ears, for unless this is accomplished the patient is no better off than he was without the aid.

Testing of Hearing Aids.—The actual testing of hearing aids should be done under carefully controlled conditions which can be kept uniform for all aids tried by the patient. This situation was possible in the service aural rehabilitation centers and can be found in some civilian clinics. It is not present in the salesrooms of the hearing aid companies. The hard of hearing person has an abnormal speech-hearing pattern and consequently needs guidance by a trained specialist in the selection of the best hearing aid for him. Suitable test hearing aids are selected by first deciding the amount of amplification needed, and then whether this amplification should be equal for all frequencies or whether greater emphasis should be placed on the high or the low frequencies. Experience and research work carried out in the service programs and the Harvard University Psychoacoustic Laboratories have shown that for a large majority of patients better speech discrimination is obtained if the frequency emphasis rises approximately 6 decibels per octave. In most of the instruments of modern type this is done by means of a tone control. However, some patients cannot tolerate this type of frequency emphasis. Hearing clinics using a large group of test instruments conform in general to the recommendations of the hearing aid companies. The company's statements can be accepted in regard to the characteristics of the individual models. These test instruments are classified under three main categories. (1) amount of amplification, (2) frequency emphasis and (3) tonal quality. With a knowledge of the degree of the hearing loss and some information about the patient's tolerance for amplified sound, it is a relatively simple matter to determine the amount of amplification needed and whether the test aids to be tried are selected from the minimum gain instruments. The second category is not as simple, for the audiogram gives only an indication of the frequency emphasis needed. Much has been written about selective amplification and "mirroring" an audiogram. Theoretically this can be done, but practically it is impossible with the modern portable hearing aid because of the number of factors which modify the performance of a hearing aid when actually worn by the patient. With the audiogram as a guide, an adjustment is made in the tone control setting, or suitable model instruments with fixed characteristics are selected for testing. The third category, tonal preference, is almost completely unpredictable and is directly related to the psychologic makeup of the patient. The fact must be accepted that the hearing aids of different companies have different tonal quality; for example, some are crisp or sharp, others are mellow, while still others are hollow. It is essential that this quality inherent in the hearing aid be acceptable to the patient, for it is an essential factor in the comfor with which he is able to wear the aid. Only by trying out different makes of hearing aids is it possible to determine the quality that will be acceptable to the individual patient. After the selection of the suitable test aids, some standard method of comparison should be carried out. Ideally there should be a preliminary screening test in quiet and in the presence of noise followed by controlled scientific tests such as the speech reception gain test which gives an absolute figure for the gain obtained in hearing for speech by the use of hearing aids. This test can be carried out simply or in elaborate steps using various intensity levels of speech and ambient noise. Only by means of comparative tests of various types carried out in uniformly controlled situations can the hard of hearing person be assured that he has obtained the best possible hearing aid for his particular type of loss. This aid must be comfortable to wear, it must give the patient the optimum in sound discrimination and must give a gain in speech reception of at least 30-decibels except in the case in which the hearing loss is so moderate that less than 30 decibels of gain is sufficient. The average gain obtained by the patients fitted with hearing aids in the Navy's Aural Rehabilitation Program is 36.3 decibels. If these procedures are carried out and the patient has the assurance that he has obtained the best possible hearing aid "fitting," his adjustment to the use of the aid will be much more rapid and—more important—will probably be successful.

WHAT A HEARING AID IS AND DOES

QUESTION: What must I know about modern hearing aids if I am to prescribe them satisfactorily?

Miss Thompson: I would question the use of the term "prescribe," but whether one uses this term or "selection" or "fitting" it is essential that one should know what hearing aids do, what they are, how they work and whom they are for. A hearing aid is a miniature public address system, consisting of a microphone that converts sound into electrical energy, an amplifier that increases this electrical energy and a receiver that converts this electrical energy back into acoustic energy at a louder intensity. If this amplification is done equally for all frequencies one says that the system has a flat characteristic or has a flat frequency response up to a specified frequency. Only high fidelity systems are capable of doing this. Hearing aids introduce a considerable degree of frequency distortion; that is, they amplify some frequencies to a greater extent than others. However, this frequency distortion can be changed and controlled by means of tone adjustments. Experience has shown that greater amplification in the speech frequency range than in the low frequencies gives better speech discrimination, and consequently, this feature of hearing aid amplification has been used to advantage. Normal hearing cannot be obtained by the use of a hearing aid, for it is impossible to take an abnormally functioning ear such as is found in the hard of hearing patient, and attempt to compensate for this abnormality by frequency distortion amplification. Two abnormal conditions cannot make a normal condition. However, it is possible to approximate this goal, and that is what is done by the use of hearing aids. The amount of amplification can be adjusted by the volume control, the frequency emphasis by the tone control. The basic parts of a modern vacuum tube are the hearing aid transmitter (microphone and amplifier), two batteries, an A and a B battery, and the receiver. The microphones and receivers may be either crystal or magnetic. The receiver may be air conduction or bone conduction. However, in the Navy's Hearing and Speech Clinic it has been found that in the majority of cases the air conduction receiver is more efficient than the bone conduction receiver; consequently, only a small proportion of the hearing aids issued by the Navy have been of the bone conduction type.

Basic Requirements.—A hearing aid should meet certain basic requirements such as those outlined by the Office of Scientific Research and Development. 1. Power: It must have sufficient power to bring audible sounds to the deafened ear. 2. Tolerability: Sound must be brought to the ear without causing pain, tickle, or serious discomfort. 3 Fidelity: In terms of the patient's ability to interpret sound, the hearing aid should make intelligible any clear connected speech. 4. Wearability: The ear piece must be tolerable to wear, and the instrument as a whole must be portable without unreasonable discomfort and inconvenience. 5. Sensitivity and amplification: The aid must make ordinary speech intelligible at conversational levels. Hearing aids meeting these specifications and also the minimum requirements of the Council on Physical Medicine of the American Medical Association carry the seal of approval of the American Medical Association. Only accepted aids should be recommended by the audiologist. A list of these accepted aids can be obtained by writing Mr. Howard Carter, the Secretary of the Council. Information in regard to the degree of amplification, the frequency emphasis, the construction of the instrument and the design of various individual features of specific instruments can be obtained from the published reports of the Council on Physical Medicine of the American Medical Association. These references may be found in the list of accepted aids, which is revised as new aids are approved. Additional information in regard to the selection of suitable test aids for specific types of hearing losses may be obtained from the hearing aid companies. Thorough familiarity with the accepted makes and models of hearing aids that are to be tried by the patient is necessary to do a completely satisfactory hearing aid fitting. In no other field of medicine would a prosthetic appliance be recommended without a complete understanding of all features of not only the prosthesis but also the individual problems of the case.

PSYCHOGENIC LOSS OF HEARING

QUESTION: What help can I expect of electro-acoustic tests in the diagnosis of psychogenic loss of hearing?

Miss Thompson: A full discussion of this question would involve not only a detailed description of modern hearing testing technics and apparatus but also a discussion of types of psychogenic deafness. The recognition of the fact that there is a psychogenic component in at least 15 per cent of our hard of hearing patients reflects a comparatively new trend in medical science, a realization that there is probably no such thing as a purely organic disability; every somatic disturbance tends to produce a psychic change. The otologic problem is the same as that found in any other branch of medicine, that is, to determine the extent of the organic lesion and find out if possible how many of the symptoms can be attributed to psychogenic overlay. Again, much as it would simplify the problem, one cannot divorce the patient from his ears and one is forced to consider him an individual and to the best of one's ability try to find out what he is doing with his ears and what his ears are doing with him. For this reason, as in every branch of medical science, tests have been developed to determine as objectively, as accurately and as scientifically as possible the purely physiologic function of the special sense or organ under observation. In the science of audiology this has been difficult, because of the number of variable factors which are involved. The more of these variables that can be controlled in audiologic test situations the more objective will be the findings and the more information gained about the pathology of the ear. This has been the goal of audiologic research. Though the goal has not been attained, many of the classic tests have been adapted to electroacoustic apparatus and new tests have been developed. Modern hearing tests are essential in the diagnosis of an ear condition as first encountered, the condition of the ear during and following treatment and the prognosis of the case. Practically every patient with an ear complaint, unless the condition is external, has some dysfunction of the hearing mechanism. This dysfunction may be reflected in the patient's reactions, and a psychogenic tendency might be recognized and perhaps abated at this stage, provided that the hearing tests are carefully conducted and accurately controlled and an understanding of the psychologic changes which occur in a person with a mild recent hearing loss are recognized by the otologist. If the possibility of these changes occurring is not recognized by the otologist, a psychogenic overlay or some other form of psychogenic hearing loss may develop. The audiometer is considered by all audiologists the basic apparatus for the testing of hearing. No test has been presented to supplant the audiometric test. All other tests are used to supplement it. The newer ones, such as the speech reception test, give additional knowledge in regard to the individual case. Why in 60 to 70 per cent of cases is there such close agreement between the audiogram and the speech reception test and little or no variation on retests? What is the reason for the discrepancy in the other 30 per cent? Because modern electroacoustic equipment is available, it is now possible to find some of the answers by the use of special tests.

Time does not permit a detailed discussion of all the tests which have been used; hence, only those that have been found helpful in the selection and diagnosis of cases involving possible psychogenic deafness will be considered: (1) repeat audiometric tests showing fairly wide discrepancies; (2) repeat speech reception tests given in conjunction with the audiogram showing little or no correlation with the audiogram or with the previous test; (3) bizarre results of bone conduction test whether the test is conducted with tuning forks or the audiometer; (4) conversational voice and whispered voice tests that do not conform to the speech reception test; (5) Lombard test carried out using full spectrum noise carefully calibrated; (6) Stenger test using two perfectly matched earphones, matched in reference to frequency and intensity, and if possible a calibrated attenuator for each earphone, and (7) the Doeffler-Stewart test, perhaps the newest of the tests that have been helpful in the diagnosis of the psychogenic case. This test is based on the masking effect of noise on speech, but here again the type of noise used, the calibration of the special equipment and the technic of giving the test must be thoroughly understood before the results can be used for diagnosis of psychogenic deafness, but this statement can be made about the use of any electroacoustic equipment. Electroacoustic equipment is not mysterious. Practically all of you drive automobiles and would probably admit that you know little or nothing about mechanics, but you know the purpose of each of the push buttons and the rules and laws of the road. Electroacoustic equipment is not much more intricate provided that one takes time to learn the rules and the laws of the road and respect the push buttons—not only of the equipment but also of the patient with whom one is dealing.

AUDITORY TRAINING

THE MODERATOR: In 1940, Day estimated that well over 70 per cent of the people who got hold of a hearing aid discarded it. I would like to ask Dr. Baker what is meant by auditory training, and what is needed to accomplish it.

DR HERBERT KOEPP-BAKER, Chicago: You are accustomed to thinking in terms of deafnesses, of losses, of disability. To have a thoroughly useful auditory rehabilitation program, you must shift about and take the view that you are not so concerned with what the patient has as with what he has left. Auditory training is best defined as that preparation of the living active organism for using most efficiently what he has left.

Preparatory State.—It is divided into three parts. There is a so-called preparatory state or period in which the patient is helped to understand what will be expected of him when he is being measured for a determination of his loss and also what he is going to do with the amount of hearing he has left. There is reason to feel that before a patient is fitted with an aid a psychologic and a physiologic preparation would have utility for a later time, and by that I mean that he ought to come to understand what amplified sound is like. To many of us, it is not a normal experience, and to the deafened person it is probably even less normal. I suggest, therefore, that to provide controlled managed experiences in listening to amplified sound may be of real value to the person who is being fitted ultimately with an amplification device.

Second Stage.—The second stage of auditory training is a preparation that follows three major steps: telling the patient what he needs to know; helping him to get the facts about what he needs to know, and, about the instrument and, the third step developing an attitude about its use. One may wonder whether that is auditory training, whether the psychosocial preparation that the patient gets for the use of amplification is auditory training. Indeed it is. We physicians are coming to evaluate much more reasonably the place of the central processes in hearing. Hearing is something more than merely the transmission of acoustic energy through the ear channels into the brain. As we have learned in vision, so we are learning in hearing that a great deal of consequence goes on in the central nervous system of the patient; hence an auditory training program concerns itself not only with reestablishing the greatest possible utility of the peripheral and middle and central mechanism, but with establishing a whole new attitude toward the act of hearing.

Third Stage.—The third stage in auditory training is helping the patient to become a skilful user of the aid. By that I mean becoming a specialist in being deaf. I should like to point out here that the fundamental attitude that is established, of course, is one that he is deaf and that his hearing aid will do nothing more than to assist him to use effectively what he has. We do not at any time intend to make a deaf person think that he is normal. What does this third step consist of? It consists essentially of providing the greatest possible control and free experiences in hearing. Some of those can be done in terms of using live situations properly managed, and others can be managed only in a quasilaboratory situation. How practical is this? A few days ago I recommended to a woman who had been fitted with a hearing aid that she learn how to use her radio as a retraining device. It maintains reasonable satisfactory continuous attenuation in a large city. She is able to hear all kinds of speech by amplification. She can sit near or far. My associates and I have prepared a manual that suggests how certain devices of amplification, such as the phonograph and the radio, can be used in the home, and from these devices the patient can learn to make daily and regular adjustment to a hearing aid, which is, after all, a device for amplification.

LIP READING

QUESTION: What is new in speech (lip) reading?

MISS MIRIAM PAULS, Philadelphia: The fundamental objective of aural rehabilitation is to restore ease of communication. This aim is most efficiently achieved when the hard of hearing person is taught to integrate what he hears with what he sees, within the framework of the situation of the moment. This is the role of speech reading. The emphasis is placed on how visual cues supplement auditory cues, for hearing is the easiest and the most natural way to understand speech. The speech reading lessons should be integrated with the auditory training and the two based on a simplified background of phonetics. This in no way implies that speech reading is unimportant. Quite the contrary; it is merely a shift in emphasis. Every hard of hearing person should have instruction in the subject as soon as possible, for it is indispensable. However, its limitations must be recognized. Speech reading can never completely supplant hearing, since much of the speech pattern is next to invisible. The solution for most persons is a combination of a well selected hearing aid and speech reading which will enable them to communicate freely and easily.

PSYCHOLOGIC GUIDANCE

QUESTION: What psychologic guidance and assistance do the hard of hearing and deaf require?

MISS PAULS: Every one working with the deaf and hard of hearing must be a "psychologist" in the broad sense of that overused word, for the basic problem is one of psychosocial adjustment. Everything is hinged on the attitute of the hard of hearing person toward his loss; whether he accepts it calmly and objectively with the quiet determination to conquer it, or whether he chooses to evade the responsibility either by self pity, bluff or rebellion. Group therapy is one of the most effective ways to establish a healthy perspective. In a skilfully conducted class, ostensibly set up to develop skills and give information about ears and deafness and hearing aids, the necessary attitudes are inculcated. Each man profits by the successes and failures of his classmates. A sharing of problems does much to clear the air. It is important that the hard of hearing person accept his responsibility to become a "specialist in deafness," for the more insight and knowledge he has, the quicker and surer is his adjustment.

INSTRUMENTS, METHODS AND PROCEDURES

QUESTION: How can these instruments, methods and procedures be made practical for the practicing otologist?

DR. EDWARD H. TRUEX, Hartford, Conn.: This is not an easy question to answer in a comprehensive manner since, in referring to instruments, methods and procedures the whole complicated system of aural rehabilitation is involved. The system becomes practical for the practicing otologist only to the extent that the various specialized facilities are available to him and to his patients. Aural rehabilitation is composed of several highly technical fields of endeavor into which the average otologist has neither the training nor the time to enter without neglecting his own specialty

Aural Rehabilitation Centers.--To be truly practical for the average otologist, aural rehabilitation centers should be established in strategic locations equipped and staffed to carry out all phases of the work. Such centers do exist at the present time, but they are few in number and are for the most part connected with university teaching programs. The establishment of such centers is an ideal which can be attained only over a period of years, but which usually begins with a small nucleus of interested persons and meager equipment One such nucleus, is the local chapter of the American Hearing Society. Some of these organizations are equipped to carry out a hearing aid selection and an auditory training program. All of them offer instruction and practice in speech reading. With a little effort on the part of one or more otologists, limited facilities such as these can be expanded gradually to cover all phases of rehabilitation. If such an organization is not available or if for some other reason its services are not desired, a group of otologists in a community or the otologic staff of a hospital can combine its efforts to institute a part or all of the measures with which we are concerned. As early as possible in the formulation of a rehabilitation unit speech reception equipment should be acquired. This equipment using either recordings or live voice as the testing medium is attainable at a reasonable cost or can be constructed according to desired specifications by any good radio construction man Personnel needs for the unit at first can be solved by employing a testing technician who has had adequate experience in audiometry and has the ambition and intelligence to progress further. There are several university seminars and well developed functioning centers which offer ample opportunity for him to learn and advance rapidly in his work. On the other hand, if the demands of a newly formed unit warrant, it is possible to employ highly skilled technical help—either men or women—with graduate degrees in speech and hearing conservation. In addition to this type of technical employee, the part time or full time services of a lip-reading instructor will be needed to carry out the pedagogic aspects of the program. The major problem in the formulation of such a unit or clinic concerns the hearing aid samples or supply. In any community only those instruments should be dispensed that have readily available repair and replacement facilities in order to insure the patient uninterrupted hearing. It is possible for any clinic to purchase outright various makes and models of hearing aids, but this is seldom practical from the economic point of view. Any clinic endorsed or actuated by otologists will find the majority of hearing aid agents cooperative. Most of them will be happy to lend the clinic sample instruments and maintain them in optimum working condition, provided that all instruments are given unbiased appraisals in the fitting of each patient. If this system is not practical, two alternatives are left: 1. Arrangements usually can be made for individual hearing aid agents to attend the clinic at specified times to fit patients. In this way supervision can be carried out which will discourage any sales pressure on the part of the agent. Various instruments thus fitted can be tested comparatively on each patient and the final selection made accordingly. 2. The patient can be sent to several different agents with the understanding that no instrument would be purchased without being tested in the clinic. This method does not eliminate the effectiveness of sales personality but does offer the opportunity of testing several instruments in a selective process.

Informing the Patient.—In most communities it is not possible to support such a clinic, and yet the otologist is anxious to be of greater personal assistance to the hard of hearing patient. There are several things that he can do in his office. The simplest measure which will be of great benefit is to devote a few extra minutes to the imparting of information. As a rule most of us recommend that a patient buy a hearing aid, offer him the names of one or more distributors and send him on his way. 1. Be sure that such a patient understands that a hearing appliance does not correct the defect that exists, that it merely amplifies sounds for him to hear. It is not comparable to a precision ground lens which corrects an optical defect in the eye. 2. Warn the patient about noises. An aid will amplify ambient noises as well as the sound that he is desirous of hearing. These noises will disturb him a great deal, especially since he has not heard them for some time. It is important that he not purchase a particular hearing aid just because it is the least noisy one, since it is usual that the instruments which amplify extraneous sounds most loudly also will amplify the spoken voice most satisfactorily. The patient should understand that selectivity is a faculty of his central nervous system and not to any great extent an inherent part of the instrument, that weeks and even months of intelligent usage will be necessary before optimum benefits are attained. 3. He should be advised to take instruction in reading lips if such instruction is available. Do not mislead him into the belief that learning to read lips will be easy or that it will solve most of his conversational problems. On the contrary, he should be informed that it will be an arduous and boring task to become relatively proficient and at best it is only an *adjunct* to his aided or unaided hearing. The few extra minutes devoted to discussing these subjects and answering questions which the discussion evokes will *be of immeasurable benefit to the patient.*

Custom Made Ear Piece.—The otologist actually can go one step further in his office practice without a gross expenditure of time. Optimum reception from an air conduction hearing aid necessitates a custom made ear piece. Ordinarily the impression is taken by the sales agent and the ear piece furnished after the patient has decided to purchase a particular instrument. I believe that the piece should be furnished before any attempt is made to select an instrument, thus eliminating one of the many variables that are encountered in comparatively evaluating different makes and models of aids. The new plastic dental impression compounds permit the otologist to take an impression of the concha and canal with safety and cleanliness in a period of ten minutes. The impression can be sent to any of several laboratories for processing, and the finished "lucite' product will be returned within a few days. Moreover, if the ear piece is furnished, most of the hearing aid companies will deduct its cost from the cost of the instrument purchased. The otologist can go considerably further if he so desires, but in so doing he must be prepared to devote many hours of his time to each patient or must employ technical help as part of his office staff to do the work under his direction. It is entirely practical under these conditions and with speech reception equipment to carry out a system of hearing aid selection and auditory training in private practice.

AURAL REHABILITATION

QUESTION: How much can I expect general otologic treatment to contribute to an aural rehabilitation program?

DR. TRUEX: General otologic treatment is of much greater importance in the prevention of handicapping degrees of hearing loss than it is in the restoration of serviceable hearing to those so handicapped. As a rule, the person whose acuity of hearing is sufficiently poor to warrant rehabilitative measures has little chance of rehabilitation through general otologic treatment. Moreover, the longer the hearing loss has existed the more remote becomes the possibility of significantly improving it by ordinary methods. In this connection it is worthy of note that the vast majority of patients who are in need of aural rehabilitative measures have experienced the gradual increase of the deficiency over a period of years. Hearing loss becomes a decided handicap when it reaches the 30 to 35 decibel level in the better ear. This may be considered the critical level at which a ten decibel change in either direction means the difference between serviceable unaided hearing and a prosthetic device. The removal of aural polyps and the drying up of chronically discharging ears frequently result in the gain necessary to elevate the acuity of hearing to a practical level. Occasionally sinusitis and nasopharyngitis, allergic rhinitis and nasal polyps are important factors in depressing middle ear functions and when adequately treated result in an improvement above the critical level of hearing. The removal of nasopharyngeal lymphoid tissue by surgical treatment or radiation or by a combination of the two often results in a dramatic improvement in auditory function and not infrequently in a return of hearing to normal. These dramatic results are observed almost exclusively in children whose difficulty is due to obstruction of the eustachian tubes. Nevertheless, a conductive or predominately conductive type of hearing deficiency warrants careful attention to the nasopharyngeal lymphoid tissue, particularly if the history suggests repeated otitic inflammation. I think that we all agree that general otologic therapy is of no specific benefit when the deafness results from otosclerosis or when due either to primary or secondary damage to the neural elements. Some of these patients experience a certain psychological benefit from treatment, but such benefit is immeasurable and short lived. Certainly every patient with a handicapping degree of hearing impairment who has some chance of improvement should be treated intensively, but they are few in number. The others should not be obliged to waste time and money in receiving treatment. They should be advised against constantly grasping for miraculous cures. They should be informed that you as an otologist will seek them out if research uncovers anything that promises to help their hearing. Then they should be assisted in implementing their residual hearing through the other methods discussed here today.

SURGERY

QUESTION: What part does surgery play in the rehabilitation of the hard of hearing?

Dr. Truex: Surgical treatment has been firmly established as a method of rehabilitating in certain cases of impaired hearing. I refer, of course, to the Lempert fenestration operation. As more and more trained surgeons become experienced in performing this operation, the greater will be its effectiveness. Moreover, continuing research may increase the scope of this procedure to include a considerably larger proportion of the hard of hearing population and almost certainly will result in a consistently higher percentage of permanent successes. At the present time reports of successful fenestration operations vary from about 30 per cent to over 80 per cent of cases operated on. Some of this large discrepancy can be attributed to overenthusiasm on the part of the surgeon in evaluating his results. Some is certainly due to a careless selection of patients for operation, and some of it, I am sure, can be blamed on the liberties taken by some surgeons in determining success or failure. By far the major part of the discrepancy in my opinion is attributable to the variations in technical skill and experience of the operator. There are few operative procedures wherein success depends on the same scrupulous attention to detail and deftness of the surgeon's hand as does the Lempert fenestration from start to finish. A truly successful fenestration operation is a much more satisfactory method of rehabilitation than is the combination of a hearing aid, auditory training and instruction in lip reading. However, a relatively small percentage of those handicapped by hearing defect can be operated on with a reasonable chance of attaining practical hearing. Evidence of moderate to severe impairment of cochlea function is a definite contraindication to surgical treatment. The same applies to chronically or recurrently infected middle ears. If these cases are eliminated along with those with systemic contraindications both mental and physical, the operation has only limited application. Most of these patients can be eliminated by the otologist without sending them long distances for examination by the fenestrationist. I believe it is unwise to try to "sell" the operation to a patient, since the results for any individual patient are absolutely unpredictable, and it is not without hazard, discomfort and prolonged after-care. It should be borne in mind that those on whom the fenestration might be satisfactorily performed are as a rule easily fitted with an air or bone conduction hearing aid. I believe that the hearing aid should be heartily recommended. The patient inevitably will ask whether there is not something that can be done medically or surgically, whereupon the fenestration operation should be discussed in detail with the utmost honesty. When a hearing aid and lip reading do not serve a patient satisfactorily in his social and economic endeavors or when he has a decided aversion to such measures, the fenestration operation should be suggested. The carefully selected patient has little to lose and much to gain in these circumstances.

COMMUNITY REHABILITATION PROGRAM

QUESTION: What are my responsibilities as an otologist for the organization and establishment of a total rehabilitation program in my community?

Dr. Charles E. Kinney, Cleveland: Any otologist worthy of such a title should be a well versed audiologist. He should keep abreast of advances in the fields of detection of hearing losses, hearing testing and analysis, lip reading and auricular training. These fields are expanding so rapidly that it is impossible for one person to be an expert in all of them—but the otologist in any given community is the logical person to lead in the establishment of a total aural rehabilitation program in his area. Impaired hearing is a pathologic condition and as such is fundamentally a medical problem. America si progressing so rapidly that no physician or group of physicians can pass a resolution to the effect that hearing problems must be left in the hands of medicine and then sit back with their thumbs in their vests. As has already happened in some areas in this country the problem will "pass up" the physician. In addition to the moral responsibility devolving on the otologists of a community to lead in the establishment and running of a rehabilitation program, there is the unlimited interest that may be derived from such an endeavor. To this point, I can speak with experience. This interest can be described under three points, namely: (1) the obtaining of heart-tingling successful results; (2) the chance to offer a replacement in the training of younger otologists for the dramatic complications of mastoid disease that occurred up to twelve years ago and (3) the opportunity to enhance one's personal prestige by delving into a relatively new field.

COMMUNITY RESOURCES

QUESTION: What community resources are available to me, and how can I coordinate them?

Dr. Kinney: Too often the first thought is to go to some political body and get a law passed. The second mistake is to start talking about the erection of a new building with all the expensive electrical gadgets that are being used in some centers. Methods of detecting loss of hearing in children have now developed to the point where it is possible to establish such programs on a completely decentralized basis and still have fairly uniform technics. This fact, coupled with the belief that it is the responsibility of local boards of education to detect sensory impairments in children under their care, makes this approach the logical first step. It is possible to convince any thinking board that the number of pupil failures can be reduced by about 30 per cent when a good functioning program of hearing loss detection is in effect. The cost of reteaching failures is well known, and it is easy to convince a board that such a program will soon pay for itself. Recommended methods of procedure have been published by others and myself and do not need repeating.

Sources of Funds.—As the twig is bent so will grow the tree. Applying this axiom to the hearing problem, many hearing problems among adults will be eliminated by a good hearing conservation program in the schools. The next step is go into the adult field. With a program in effect for conservation of hearing among children there will then be available lip reading and auricular training teachers to be the nucleus for a program among adults. The community fund is a logical financial approach to the adult problem, but in no instance should this remain the only source of revenue. Ten years ago, our program in Cleveland was 100 per cent supported by the community fund, but today this support amounts to only 26 per cent. This other support may come from service organizations such as the Rotary and Kiwanis, from veterans' organizations such as the American Legion and the Veterans of Foreign wars, from any number of fraternal organizations, from civic organizations such as senior and junior chambers of commerce and from individual persons and foundations. As the program for conservation of hearing of adults develops further, there then become available new sources of revenue. An impartial hearing aid advisory bureau is now possible, and we have found that fees charged persons using this service have been graciously refunded to these persons by the local agents who sell them their hearing aid. And, finally, if a university connection is possible, the tuition fees charged students taking up the various phases of this work make up a goodly amount. You will notice that I have eliminated federal, state and city control of such a program. This is desirable.

RESEARCH

QUESTION: What research needs to be done?

Dr. Kinney: Research in the problem of deafness is still a large field. At least fifty problems need much study. I will confine my answer of this question to outlining four important problems. The first of these is a better understanding of the physics of the movement of fluids in a closed container. Then we could better study the function of the perilymph and endolymph.

The work that is being done at the University of Chicago on ossicular movements is an example of fundamental hearing research. The second fundamental research that I would like to mention is of a sociologic nature. Every year in this country several hundred children are born without hearing because of this tendency in their progenitors. If we can inbreed certain desirable traits in our population, it is possible to outbreed this undesirable trait. The third problem that needs much study is the pathology and chemistry of otosclerosis. Although I consider the fenestration operation the greatest otologic contribution in this century, it is still a treatment of the deafness and does not alter the disease. The enthusiastic reports of successful treatment of this disease have been marred by poor hearing testing methods. The fourth problem is in the field of physics. This concerns the problem of sound transmission. Although the principle of microwave transmission was first described during the last century it is just now being developed to the point where it looks as if it may be used in the hearing problem. The Bell Laboratories did wonderful work during the war in the development of methods of destroying our enemies. Let us now use this knowledge in defeating the handicap of deafness.

The Moderator: We have finished our questions, but certainly I have heard some provocative remarks. I know there are experts in the audience, and with due humility we faced you. We were only selected; it was not our own choice, but we hope we have contributed something, and perhaps you would like to ask some questions or add something to this panel discussion.

COMBAT CASUALTIES

Dr. Canfield: The figure that was given on the film as 25 per cent of combat casualties must be clearly understood. By that is meant the men in the war whose deafness came on actually in combat. That means when they were exposed to the gunfire or when they were on the front line. Now, the two large groups that were studied in the Army varied from 38 per cent to about 18 per cent; and that is how that figure of 25 per cent was arrived at. It is believed that it is somewhere between those two. As for the amount of psychogenic deafness among civilians as profound as you saw a picture of on the film, it is probably in much less than 1 per cent of all of the persons who have hearing handicap. I mention this because the film did present a new technic. We do not know precisely the number of civilians with psychogenic deafness, but we do not feel that it is much less than 1 per cent. The 25 per cent was the percentage of men whose hearing actually was depleted in the battle itself, and not the number of men who came from the hearing centers.

PSYCHOGENIC DEAFNESS IN CHILDREN

Question: Are the psychogenic factors in the hearing suppression in children?

Dr. Koepp-Baker: Yes. The character of disturbances of emotional life in children has received emphasis in recent times, particularly on the diagnostic side. Most of us are aware that a number of persons have become sensitive to the fact that many young children seem to hear less than they ought to be hearing with their mechanisms. Hearing and understanding are two different things. Any tests that relate to this dysfunction in children must take into account a larger aspect which is total language function.

IRRADIATION AND ADENOIDECTOMY

Question: Are there any statistical studies on the improvement of hearing following adenoidectomy or irradiation of lymphoid tissue?

Dr. Truex: It just happens that all of us in our routine practice have seen cases of early hearing loss in which the middle ear is involved in children respond dramatically to removal of the adenoids or to irradiation, and as far as statistics which are reliable are concerned, which would cover a large group of children I cannot give you a definite answer more than to refer you to Dr. Crowe's literature on the subject, from Johns Hopkins University.

DEAFNESS IN SCOTLAND

Dr. G. E. Martin, Edinburgh, Scotland: This problem that we have been discussing today is our problem as well. We have given up all thought except under what we call our Administrative Pensions, which is your Veterans Administration. We have given up all thought of carrying it out among adults until we can get our school clinics going. We have been handicapped with a disruption of the whole of the country during the war, but our school clinics are going in many cases and we have also a certain amount of research work going on under the auspices of our Medical Research Council, which is not a government council but is about that, and this research is being carried out by three committees. Unfortunately, I have had to be on the three of them. One is on the question of hearing aids. The second one is on the education of the deaf, and the third is on the surgical and medical aspects of deafness. The report on hearing aids is in print but has not been released to the general public, partly because the Government has stepped in trying to make use of a new hearing aid which is being evolved by the experts on this committee and which is better than any other hearing aid in the market as far as I have seen, and much cheaper. It embodies a new principle, which is simple and makes the hearing aid cheap. That hearing aid, unfortunately, is not in the Government control, and we cannot say much about it because we cannot get hold of it, but the work of that committee will soon be made available. The other two committees are still going on. They are extensive, because the one, for instance, on the education of the deaf not only is composed of otologists, but also teachers, and we are concerned with the question of how best to teach teachers to train the deaf, to teach people to look after these clinics and also to teach otologists to recognize deafness. The third is taking up all the medical and surgical problems of deafness, much of which was discussed this morning with the Lempert operation. We do not call it the Lempert operation of course, but we recognize that the operation has been built up here on a scale such as we have never been able to do it, and the results we have correlated in the most scientific way that we possibly can. You have heard today how some of the figures are up 35 per cent, others up 85 per cent. There must be something wrong in getting these figures together, and that which has behind it, fortunately, unlimited scope and also plenty of money; because it is controlled by the Treasury and cannot be interfered with by the Government. Hence, we hope to have the primary reports of two of these committees out by the end of this year; then one will be able to get down the things much better than in the past.

Clinical Notes, Suggestions and New Instruments

SENSITIVITY TO STREPTOMYCIN

Anaphylactic Shock with Recovery Following an Intracutaneous Test

FRANK L. ROSEN, M.D.
Newark, N.J.

A recent report[1] advises intradermal tests for determination of sensitivity to streptomycin. That this procedure is not without danger is illustrated by the following report of a case.

Report of a Case

F.S., a 21 year old white student nurse in her third year of training, complained for a year of rash and itching of the fingers and dorsa of the hands. There was no history of previous allergic disease except for occasional mild urticaria. Dermatologic treatment, together with a course of roentgen therapy, had brought no relief. She had never received penicillin or streptomycin, but had been exposed to them in the course of her work.

Results of examination were normal except for the fingers and dorsa of the hands, which revealed a vesicular weeping scaling rash, suggesting contact eczematous dermatitis.

On the medical ward of the hospital, Oct. 20, 1947 I injected intracutaneously 0.05 cc. of streptomycin (Merck, calcium chloride complex). The test dose (5,000 units) was taken from a 20 cc. vial made up for 100,000 units per cubic centimeter. The contents of the vial had been given to several patients on the ward in 200,000 unit doses without any untoward reaction.

About two minutes after the test, the patient complained of generalized itching and wheezing and then collapsed, with weak and rapid pulsation. She was given a subcutaneous injection of 0.5 cc. of epinephrine and admitted to the medical service.

She continued to wheeze for about fifteen minutes, was semistuporous and complained of generalized itching and severe cramps in the lower part of the abdomen. About one-half hour after the test both eyelids swelled up. Two hours later her temperature was 101 F., pulse rate 80 and respirations 20. Asthmatic pulmonary findings had now disappeared. The generalized itching and cramps (uterine contractions?) persisted for the next two days, with moderate relief obtained with epinephrine, tripelennamine hydrochloride (" pyribenzamine hydrochloride") and meperidine hydrochloride (" demerol hydrochloride"). The patient returned to duty on October 23.

Subsequent routine allergy tests revealed positive reactions to the following items: dust (moderate), ragweed (decided), alternaria (decided), tobacco (decided), cat dander (slight), aspergillus (slight), kapok (moderate), buckwheat (slight) and green peas (decided). Reactions to passive transfer tests, with 100 units per cubic centimeter of streptomycin injected intracutaneously, were moderately positive. Patch tests with the substances encountered in the patient's environment revealed positive reactions only to soft soap liniment and benzalkonium chloride (" zephiran chloride tincture I to 1,000 [tinted]"). Patch tests with streptomycin were not done.

Comment

No reaction to streptomycin was evident at the cutaneous test site for forty-eight hours; a typical tuberculin type of response then appeared, with a reddened indurated area of 3 by 4 cm. This reaction gradually faded out over a period of one week.

Conclusion

If cutaneous tests with streptomycin are contemplated in nurses and others who handle streptomycin, especially those who have cutaneous lesions due to contact, it is suggested that the usual vial strength used for therapeutic purposes (100,000 to 200,000 units per cubic centimeter) be well diluted. Rauchwerger[1] and his associates suggested 100 units as the cutaneous test dose.

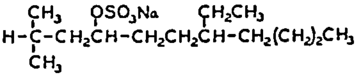
Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., *Secretary.*

SODIUM TETRADECYL SULFATE.--Sodium-2-methyl-7-ethylundecyl sulfate-4.--$C_{14}H_{29}SO_4Na$.--M.W. 316.43. The structural formula of sodium tetradecyl sulfate *may be represented as follows:*



$$H-\underset{\displaystyle CH_3}{\overset{\displaystyle CH_3}{C}}-CH_2\overset{\displaystyle OSO_3Na}{CH}-CH_2CH_2\overset{\displaystyle CH_2CH_3}{CH}-CH_2(CH_2)_2CH_3$$

Actions and Uses.--Sodium tetradecyl sulfate is an anionic surface active agent that has been found to be useful as a wetting agent to increase the surface activity of solutions of certain externally applied antiseptics to which it may be added. It also possesses sclerosing properties useful for the obliteration of varicose veins by intravascular injection of buffered solutions in appropriate concentration. Its rather profound sclerosing action is subject to the disadvantage that injection may produce sloughing and is occasionally associated with greater frequency of leg cramps and pain than with other sclerosing agents. On the other hand, the possibilities of senitization are considered remote and idiosyncrasies or anaphylactoid reactions that have infrequently occurred are mild and of short duration. The possibility of undiscovered toxic effects should be borne in mind, but careful clinical studies to date appear to warrant use of the compound as a reasonably safe sclerosing agent.

Sodium tetradecyl sulfate is subject to the same general contraindications as for other sclerosing agents. See preceding general statement on Sclerosing Agents.

Dosage.--Sodium tetradecyl sulfate is employed for sclerosing therapy of varicose veins in buffered solutions of 1 per cent, 3 per cent and 5 per cent concentrations depending on the size of the veins (amount of hemodilution) to be obliterated. The 3 per cent solution is considered ade-

acid (U.S.P. XIII, p. 709). The heavy metals limit (U.S.P. XIII, p. 657) of 25 cc. of the filtrate obtained previously in the melting point procedure is 20 parts per million.

Transfer about 0.3 Gm. of sodium *p*-aminobenzoate, accurately weighed, to a 250 cc. beaker. Add 5 cc. of hydrochloric acid and 50 cc. of water. Mix to obtain complete solution, cool to 15 C. and add about 25 Gm. of crushed ice. Slowly titrate with tenth-molar sodium nitrite, previously standardized against sulfanilamide (U.S.P. XIII, p. 865), until a blue color is produced immediately when a glass rod dipped into the titrated solution is streaked on a smear of starch-iodide paste T.S. When the titration is complete, the end-point is reproducible after the mixture has been allowed to stand for 1 minute. Each cc. of tenth-molar sodium nitrite is equivalent to 0.01591 Gm. of sodium *p*-aminobenzoate: the sodium *p*-aminobenzoate content, calculated on the dry basis, is not less than 98 per cent or more than 101 per cent.

INTERNATIONAL VITAMIN DIVISION, IVES-CAMERON CO., INC., NEW YORK

Tablets Sodium Paba: 50 mg.

WYETH, INC., PHILADELPHIA, PA.

Tablets Sodium Paba: 0.5 Gm.

U.S. patent 2,403,473.

ESTROGENIC SUBSTANCES (WATER INSOLUBLE) (See New and Nonofficial Remedies, 1947, p. 343).

The following dosage form has been accepted:

REED & CARNRICK, JERSEY CITY, N. J.

Solution of Estrogenic Substances in Oil: 1 cc. ampuls and 4 cc., 10 cc. and 25 cc. vials available as 2,000 international units per cubic centimeter, 6,000 international units per cubic centimeter, 10,000 international units per cubic centimeter and 25,000 international units per cubic centimeter in peanut oil. Preserved with chlorobutanol 0.5 per cent.

Tablets Estrogenic Substances: 1,000 international units and 5,000 international units.

LINCOLN LABORATORIES, DECATUR, ILL.

Solution of Estrogenic Substances in Oil with Benzyl Alcohol 2 per cent: 1 cc. ampuls and 15 cc. vials available as 5,000 international units per cubic centimeter, 10,000 international units per cubic centimeter and 20,000 international units per cubic centimeter in sesame oil. Preserved with chlorobutanol 0.5 per cent.

CARROLL DUNHAM SMITH PHARMACAL COMPANY, NEW BRUNSWICK, N. J.

Aqueous Suspension Estrusol: 1 cc. dual syringe cartridges available as 20,000 international units per cubic centimeter. Each cubic centimeter contains isotonic sodium chloride suspension of estrogenic substances, principally estrone, with small amounts of other natural estrogens. Preserved with chlorobutanol 0.5 per cent.

STREPTOMYCIN (See New and Nonofficial Remedies, 1947, p. 150).

The following additional dosage forms have been accepted:

MERCK & CO., INC., RAHWAY, N. J.

Streptomycin Calcium Chloride Complex: 50 cc. vials containing streptomycin calcium chloride complex equivalent in activity to 5 Gm. of streptomycin base.

CHAS. PFIZER & CO., INC., BROOKLYN

Streptomycin Sulfate: Bulk

PENICILLIN (See New and Nonofficial Remedies, 1947, p. 144).

The following additional dosage forms have been accepted:

ABBOTT LABORATORIES, NORTH CHICAGO, ILL.

Tablets Penicillin Calcium: 100,000 units with sodium citrate 1 Gm. as a buffer.

Dulcet Tablets Crystalline Penicillin G Potassium Buffered): 50,000 units with calcium carbonate 0.25 Gm. as a buffer.

U. S. trademark 301,66

CHAS. PFIZER & CO., BROOKLYN

Crystalline Penicillin G Sodium: 1,000,000 unit vials.

MENADIONE SODIUM BISULFITE (See New and Nonofficial Remedies, 1947, p. 534).

The following dosage form has been accepted:

ABBOTT LABORATORIES, NORTH CHICAGO, ILL.

Solution Hykinone: 72 mg., 10 cc. ampuls. Each 10 cc. contains menadione U.S.P. 72 mg. and sodium bisulfite 27.5 mg. in an aqueous solution made isotonic with sodium chloride.

U. S. Patent 2,367,302, U. S. Trademark 383.789

FUNGUS EXTRACTS (See New and Nonofficial Remedies 1947, p. 9).

The following dosage form has been accepted:

ARLINGTON CHEMICAL COMPANY, YONKERS, N. Y.

Fungus Allergens: These preparations are marketed in vials containing 50 mg. of the dried fungi. In addition the items to follow are marketed as extracts for hyposensitization in 3, 5 and 10 cc. vials at concentrations 1:20, 1:33, 1:100, 1:500, 1:1,000, 1:5,000, and 1:10,000. Treatment sets of five 3 cc. vials with one vial at each of the following concentrations 1:10,000, 1:5000, 1:1000, 1:500, 1:100 are also offered.

Extracts marketed in dry form, and in solution form:
Achorion schoenleinii; Alternaria sp.; Aspergillus flavus; Aspergillus fumigatus; Aspergillus glaucus; Aspergillus nidulans; Aspergillus niger; Cephalosporium; Cephalothecium; Chaetomium sp.; Cladosporium; Epidermophyton inguinale; Fusarium; Helminthosporium; Hormodendrum; Microsporum lanosum; Monilia albicans; Monilia sitophila; Mucor plumbeus; Penicillium camemberti; Penicillium chrysogenum; Penicillium digitatum; Penicillium notatum, Penicillium roqueforti; Rhizopus; Trichoderma; Trichophyton gypseum, and Trichophyton interdigitale.

In addition the following stock fungus mixtures are offered in solution form only.

Aspergillus mixture - containing equal parts of A. flavus, A. fumigatus, A glaucus, A. nidulans, A. niger.

Penicillium mixture - containing equal parts of P. camemberti, P. chrysogenum, P. digitatum, P notatum, P. roqueforti.

Trichophyton mixture - containing equal parts of T. gypseum, T. interdigitale, and Epidermophyton inguinale.

Fungus Allergens-Arlington are made according to a standard method, viz, grown in a peptone-cerelose-yeast extract medium, collected by filtration, washed with acetone, and ether and dried.

Fungus Allergen Extracts-Arlington are prepared as follows: (directions for preparation of 1000 cc. of extract 1:20 concentration).

Fifty grams of dried fungus material are suspended in 800 cc. of N/20 sodium hydroxide, and the suspension is placed on the shaking machine for four hours. The suspension is centrifuged and decanted, and the residue is exhausted by successive extractions with N/20 sodium quate for most sites. The average amount to be injected at any one site should be from 0.5 to 1 cc. and at any one sitting, 2 to 3 cc. Not more than 6 cc. of the 5 per cent solution or 10 cc. of the 3 per cent solution should be injected at any one occasion. Repeated injections should be carried out at weekly intervals. The 1 per cent concentration should be used for all small superficial varicosities to avoid possible sloughing that may occur with the use of stronger concentrations for such veins. It is further recommended that not more than 1 cc. of the 1 per cent concentration be used as a test dose on the first injection to detect any possible idiosyncrasy. Treatment should not be instituted or continued if alarming reactions occur.

Tests and Standards

Sodium tetradecyl sulfate occurs as a white, waxy, odorless solid. It is soluble in water, alcohol and ether. A 5 per cent aqueous solution is clear and colorless. The pH of a 5 per cent solution ranges from 6.5--9.0.

Add 3 drops of 5 per cent sodium tetradecyl solution to 1 cc. of ortho-phenanthroline T. S.: an orange-red precipitate forms.

Dissolve 1 Gm. of sodium tetradecyl sulfate in 20 cc. of water and make up to 25 cc., transfer to a 50 cc. Nessler tube. Add 10 cc. of hydrogen sulfide T.S. and allow to stand 10 minutes: No more color develops than corresponds to 20 parts per million of lead *(U.S.P. XIII, p. 657)*.

Dry 2 Gm. of sodium tetradecyl sulfate, accurately weighed, in a vacuum desiccator for 48 hours: the loss in weight is not more than 10 per cent. Weigh, accurately, 1 Gm. of sodium tetradecyl sulfate into a tared platinum dish, add 2 cc. of sulfuric acid and heat gently to avoid spattering until no more fumes of sulfur trioxide are evolved. Repeat this treatment twice, then ignite and weigh. The sulfated ash content is not less than 19 per cent or more than 25 per cent.

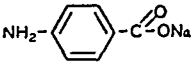
Weigh, accurately, about 0.3 Gm. of sodium tetradecyl sulfate into a suitable flask. Add 2 drops of bromcresol purple T.S., and neutralize with tenth - normal hydrochloric acid. Add slowly, with shaking, 25 cc. of a five-hundredth molar benzidine hydrochloride. Shake well and allow to stand at room temperature for 1 hour. Filter with suction. Test the filtrate for completeness of precipitation. Wash the precipitate with distilled water until the washings are neutral. Dissolve the precipitate by washing 4 times with hot 95 per cent alcohol previously neutralized to bromcresol purple T.S. Titrate the hot alcoholic solution with five-hundredth normal sodium hydroxide using bromcresol purple T.S. as the indicator. Each cc. of five-hundredth normal sodium hydroxide is equivalent to 0.0158 Gm. of sodium tetradecyl sulfate. The sodium tetradecyl sulfate found is not less than 85 per cent.

WALLACE & TIERNAN PRODUCTS, INC., BELLEVILLE, N.J.

Solution Sodium Sotradecol with Benzyl Alcohol 2%: 1, 3 and 5 per cent solution, 20 cc. vials.

U.S. trademark registered.

SODIUM PARA-AMINOBENZOATE.--The sodium salt of para-aminobenzoic acid.--$NaC_7H_6O_2N$.--M.W. 159.12 The structural formula of sodium *p*-aminobenzoate may be represented as follows:



Sodium *p*-aminobenzoate, when dried at 110 C. for 3 hours, contains not less than 98 per cent of $NaC_7H_6O_2N$.

Actions and Uses.--Sodium para-aminobenzoate has been found to exert a depressant action on the metabolism of rickettsiae that is useful for the management of certain rickettsial diseases. It is reported to be of value in the treatment of Rocky Mountain spotted fever, epidemic and endemic (murine) typhus and tsutsugamushi disease (scrub typhus). It has not proved uniformily successful in the treatment of all rickettsial infections, so its ultimate value against other forms of typhus or rickettsial diseases remains to be determined. Its use as a prophylactic is not recommended until more is known of its long term toxic effects in man and its ultimate protective value when administered routinely to persons in endemic areas.

Sodium para-aminobenzoate should not be administered in conjunction with the sulfonamide drugs because of the well known inhibitory effect of para-aminobenzoic acid on the antibacterial effect of these agents. It is not antagonistic to penicillin.

Dosage.--Sodium para-aminobenzoate is administered orally in tablet form. The recommended average adult initial therapeutic dose is 4 to 6 Gm.; this may be followed by doses of 2 to 3 Gm. every 2 hours. Within the first 24 hours of therapy with para-aminobenzoic acid in rickettsial diseases, concentrations of 30 to 40 mg. per hundred cubic centimeters of the drug should be obtained and then maintained in the blood of the patient. If definite improvement is not noted within 48 hours, increase the dose of the drug to a point which will produce a concentration of 40 to 50 mg. of para-aminobenzoic acid in the blood of the patient. Levels above 60 mg. may be dangerous, because para-aminobenzoic acid is not a completely innocuous agent but may produce hepatic and renal lesions. Blood levels range 30 to 60 mg. per hundred cubic centimeters, but since this seems to be more a function of the urinary output than of the dosage, this is usually limited to 500 cc. per day by restriction of fluid intake. Until more is known concerning the possible toxicity of the drug in man the administration of a daily dosage in excess of 30 Gm. for a period of more than one week is not recommended.

Tests and Standards

Sodium *p*-aminobenzoate occurs as a white to a buff-colored, odorless, crystalline powder, possessing a saline taste It is freely soluble in water, slightly soluble in alcohol, very slightly soluble in benzene and chloroform and practically insoluble in ether. An aqueous solution is alkaline to litmus paper.

Dissolve 2 Gm. of sodium *p*-aminobenzoate in 45 cc. of water, and add 5 cc. of diluted hydrochloric acid; a white flocculent, crystalline precipitate of *p*-aminobenzoic acid is formed. (Avoid the addition of excess hydrochloric acid which will redissolve the precipitate.) Filter by suction and reserve the filtrate for the heavy metals test listed hereafter. Wash the precipitate twice with small portions of cold water, recrystallize from alcohol, filter and dry at 110 C.: the *p*-aminobenzoic acid so obtained melts between 186 and 189 C.

Dry about 2 Gm. of sodium *p*-aminobenzoate, accurately weighed, for three hours at 110 C.: the loss in weight does not exceed 7.5 per cent.

Dissolve 50 mg. of sodium *p*-aminobenzoate in 5 cc. of water; add, in order, 0.5 cc. of diluted hydrochloric acid, 0.5 cc. of tenth-molar sodium nitrite and 10 cc. ammonia water containing 0.2 Gm. of β -naphthol: a red color develops.

Place 50 mg. of sodium *p*-aminobenzoate in a test tube containing 2 cc. of water and add, in order, 0.5 cc. of potassium iodide, T.S., 0.4 cc. of diluted hydrochloric acid, and 0.5 cc. of sodium hypochlorite T.S.: a heavy brown precipitate forms (difference from *p*-aminohippuric acid).

An aqueous solution (1 in 10) responds to the tests for sodium, U,S.P. XIII, p. 663.

Transfer about 1 Gm. of sodium *p*-aminobenzoate, dried and accurately weighed, to a 25 cc. Erlenmeyer flask containing 5 cc. of water and add 2 drops of phenolphthalein T.S.: no more than 0.5 cc. of fiftieth-normal sulfuric acid is required to discharge any pink color which may develop.

Transfer about 0.3 Gm. of sodium *p*-aminobenzoate, dried and accurately weighed, to a platinum crucible and ash to a white residue. Cool, add carefully a few drops of sulfuric acid and ignite to constant weight: the weight of the sulfated ash calculated as sodium sulfate is not less than 44.1 per cent or more than 44.8 per cent.

A 0.2 Gm. sample of sodium *p*-aminobenzoate shows no more chloride than corresponds to 0.15 cc. of fiftieth-normal hydrochloric acid (U.S.P. XIII, p. 709). A 0.3 Gm. sample of sodium *p*-aminobenzoate shows no more sulfate than corresponds to 0.1 cc. of fiftieth-normal sulfuric hydroxide until the total volume of the N/20 sodium hydroxide fractions equals 850 cc. Ethyl alcohol (95%) is added to the extract to yield a 14% alcoholic solution, and the extract is filtered through paper pulp until clear. The reaction of the solution is adjusted to pH 8.3 by the addition of either hydrochloric acid, or sodium hydroxide. Tricresol in the proportion of 0.4% is added, and the solution sterilized by filtration through a Berkefeld filter. The finished products are placed on sterility tests, and mouse test according to the methods required by the U.S. Public Health Service.

From this 1:20 extract, necessary dilutions are prepared aseptically with a diluent of sterile phosphate buffer containing 14% alcohol by volume and 0.4% tricresol. The intermediate and finished products are tested for sterility according to the methods required by the U.S. Public Health Service.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following reports. Howard A. Carter, *Secretary.*

ADC AUDIOMETER, MODEL 50, ACCEPTABLE

Manufacturer: Audio Development Company, 2835 Thirteenth Ave S., Minneapolis 7.

The ADC Audiometer, Model 50, is a fixed frequency instrument designed to test a person's auditory acuity by presenting pure tones at 128, 256, 512, 1,024, 1,448, 2,048, 2,896, 4,096, 5,792, 8,192, and 11,584 cycles per second. The apparatus is housed in a wooden case with a sloping control panel in front; the over-all dimensions are 52 by 28 by 20 cm (20½ by 11 by 8 inches) and the weight is given as 15.9 Kg. (35 pounds). It operates on 110 volt, single phase 60 cycle alternating current; modifications are available for other power sources.

The instrument is equipped with both air and bone conduction receivers, a masking tone circuit, a tone interrupter, a microphone, a signal button and a malingering test circuit. A special feature of the instrument is the inclusion of a matched pair of headphones for air conduction testing.

In evaluating this instrument the Council availed itself of detailed reports on electroacoustic performance of the instrument from two other laboratories as well as of a special report by a Council investigator who made a large number of practical tests. The matched headphones were found to be an exceedingly helpful feature. Being able to present the masking tone through one of the two matched receivers is also an advantage. The inclusion of a midoctave tone at 1,448 cycles per second permits extra exploration when circumstances indicate. Dials and controls were found to be conveniently placed and easily read. The Council on Physical medicine voted to include the ADC Audiometer, Model 50, in its list of accepted devices.

LIEBEL-FLARSHEIM FREQUENCY CONTROLLED SW-227 SHORT WAVE DIATHERMY UNIT ACCEPTABLE

Manufacturer: Liebel-Flarsheim Company, 303 West Third Street, Cincinnati 2.

The Liebel-Flarsheim Frequency Controlled SW-227 Short Wave Diathermy Unit generates high frequency electrical energy for the purpose of heating human living tissues in the treatment of disease. The electrical circuit and mechanism for controlling the frequency of Model SW-227 have been inspected and approved by the Laurel Laboratories of the Federal Communications Commission. The apparatus operates on a frequency of 27.130 megacycles and is equipped to apply energy by three different methods, namely, "spaced plate electrodes," "hinged treatment drum" and "inductance cable." The appliance requires 115 volts AC current, draws 11.5 amperes and at full load pulls 750 watts. The unit is finished in ivory or walnut; it measures 108 by 61 by 43.2 cm. (42½ by 24 by 17 inches); it weighs 77.6 Kg. (171 lbs.), and its shipping weight is 108 Kg. (238 lbs.). The apparatus has received the approval of the Underwriters' Laboratories.

The evidence submitted by the firm for power output was obtained on phantom loads. The highest output reported was 330 watts on a lamp load, using air spaced electrodes. With a cable electrode the output was 315 watts, and with the hinged treatment drum it was 250 watts. Using a calorimeter the firm reported a maximum of 310 watts obtained by the cable method. These tests on phantom loads were repeated in the laboratory of the Council and were verified within the limits of experimental error. The diathermy apparatus was sent to an investigator for clinical trial and was reported to give satisfactory service.

The Council on Physical medicine voted to include the Liebel-Flarsheim Frequency Controlled SW-227 Short Wave Diathermy Unit in its list of accepted devices.

ILLE FULL BODY IMMERSION TANK UNIT, MODEL HM-801, ACCEPTABLE

Manufacturer: Ille Electric Corporation, 36-08 Thirty-Third Street, Long Island City 1, New York.

The Ille Full Body Immersion Tank, also called the Ille Hydromassage Subaqua Therapy Unit for Full Body Immersion, is a large metal tank, big enough so that an adult lying in it can stretch out to full length, can perform maximal abduction of both thighs and can abduct the extended arms through a wide range. It is intended to be mounted so that the bottom is considerably elevated above the floor of the room, say to the height of 1 meter, to facilitate the services of the physiotherapist.

The complete unit is shipped within two crates. Crate 1 contains the tank with base, electric hoist, trolley, head rest, water stretcher and body plinth. Crate 2 contains the tank base pipe legs with floor flanges, the stretcher cross bar and cables, the tank pipe fittings, two turbine ejector carriages, two electric turbine ejectors, two turbine motor covers, thermostatic water mixing valve assembly, two dial thermometers, body hammock canvas with brackets, canvas body sling and canvas for head rest. The dimensions of Crate 1 are 295 by 18 by 84 cm. (9 ft. 8 in. by 7 in. by 2 ft. 9 in.); Crate 2 measures 137 by 76 by 76 cm. (4 ft. 6 in. by 2 ft. 6 in. by 2 ft. 6 in.). The combined shipping weight of the two crates is 680 kg. (1500 lbs.).

The Council obtained evidence that this tank unit is well constructed, of satisfactory size and shape to permit hydrotherapeutic procedures to the entire body. Treatment is facilitated by the fact that every part of the patient's body can be reached by the therapist. The motor-driven agitator itself produces a gentle massage, in addition to the manual massage that is possible in a tank of this sort. The tank can be cleaned easily after each treatment. Since both the agitator and the hoist are driven by electric motors, users are reminded that the instructions supplied by the firm regarding avoidance of shock hazards are to be carefully observed.

The Council on Physical Medicine voted to include the Ille Full Body Immersion Tank Unit, Model HM-801, in its list of accepted devices.

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

Please send in promptly notice of change of address, giving both old and new; always state whether the change is temporary or permanent. Such notice should mention all journals received from this office. Important information regarding contributions will be found on second advertising page following reading matter.

SATURDAY, JULY 24, 1948.

EDITORIAL ANNOUNCEMENT

The compositors returned to work on Monday, June 28. This issue of The Journal has been prepared in part by the use of Vari-Typer machines.

MORE CONSIDERATION FOR THE FETUS

Not many years have passed since one took for granted that the human fetus is optimally protected and maintained in utero. Attempts were not made to influence the environment of the fetus, because whatever abnormalities developed were believed to be due either to intrinsic causes or, in a smaller number of instances, to extrinsic factors beyond comprehension or control. Syphilis was one of the few exceptions to this rule.

As has happened previously when a subject was ripe for exploration, numerous lines of research are now converging, as if by accident, on pathologic conditions of the fetus. Much valuable information has been acquired; now new and old knowledge can be assembled into a systematic scientific structure.[1] The field includes two mutually related parts, namely, abnormalities of development and diseases of the fetus.

Some recent advances from clinical studies are of immediate significance to the practicing physician: the concept of erythroblastosis as a result of isoimmunization and the occurrence of malformations in infants of mothers who contracted certain virus diseases during pregnancy.

The systematic study of hereditary and experimental malformations in animals, with the methods of descriptive and experimental embryology, has revealed direct information about the actual development of malformations. Prior to these studies speculation dominated consideration of the probable development of a given malformation known only in its final form. Now it is known that in the fetus, as in the adult, previously normal parts may degenerate in various ways which cannot possibly be detected by examination of the result. Congenital defects of the eyes, extremities, intestine or other parts of the body may originate in this manner.

As interest increases in the systematic examination of newborn infants at necropsy, many instances are found in which changes comparable to those in diseases of the adult have occurred before birth. Degeneration, inflammation and scarring occur in the heart, liver, pancreas, kidneys and other organs of fetuses. The greatest handicap in the interpretation in these cases is the inadequacy of the history obtainable from the mother or her physician. Just as physicians have learned recently to inquire about the occurrence of rubella during pregnancy, other significant factors in the history of abnormal newborn infants will doubtless be recognized in the future.

Most of the recent progress from the study of abnormal development in animals and pathologic conditions in newborn infants is not of immediate clinical significance. However, this information is essential for the shaping of a systematic knowledge which must be the rational basis of any progress in the care of the fetus. This is obvious particularly in the fields of mental deficiency and blindness, in which much preliminary work has been done.[2]

The fetus is not as well protected from unfavorable agents as was formerly believed. Nutritional deficiencies, poisons, infections and radiations may be involved. Cooperation of workers in various fields of biology and medicine will lead to more knowledge about these agents and to prevention of their effects. Among the members of the medical profession, pathologists and obstetricians are in key positions. The former should expand their facilities and interest with regard to newborn, as well as stillborn, infants. Obstetricians should supply more detailed information on the course of pregnancies resulting in abnormal infants and should also be prepared to plan the practical application of new results of fetal pathology.

THE BRITISH NATIONAL HEALTH SERVICE ACTS

A special representative meeting of the British Medical Association, held on May 28, adopted the following action:

(1) That, despite the insufficiency of the safeguards to the profession's freedoms and the misgivings of a substantial section of the profession, the Representative Body, anxious as ever that in the public interest a comprehensive health service should be made available to the community, is prepared to advise the profession to cooperate in the new service on the understanding that the Minister will continue negotiations on outstanding matters including terms and conditions of service for consultants and specialists, general practitioners, public health officers and others.

Rider

That the medical profession should accept service under the Act on the understanding that in the event of the amending Act and terms of service being unsatisfactory to the Representative Body, members serving under the Act should then hand in their

> resignations or take such other steps as are considered necessary by the Representative Body.
>
> (2) That the Representative Body urges the profession to maintain its strength and unity in order to mould the service in accordance with the public interest and with enlightened professional opinion and continuously to protect the profession's legitimate freedoms and interests.

According to notices recently published in American newspapers the dental profession in Great Britain still refuses to cooperate with the British government under the act.

In the course of negotiations the British medical profession has succeeded in securing from the Minister of Health a bar on the introduction of a whole time salaried service by regulation and a universal basic salary. The medical profession has failed to secure concessions on questions of the ownership of good will in a doctor's practice and the right of appeal to the courts from decisions of the Minister. The Council of the British Medical Association is convinced that some progress has been made but also that the freedoms of the profession are not sufficiently safeguarded. Under recent decisions the Catholic and other denominational hospitals in Great Britain are freed from participation in the government plan and will not be taken over by the British government as are community hospitals.

The British experiment in socialization of medical practice appears to be a top heavy organization to administer a personal service. The act becomes effective on July 5, and the medical world will watch with interest whether or not this experiment develops any hope of success in achieving its objectives or even in improving on what Britain has had in the way of medical service.

Current Comment

INDEX NUMBER

In this issue of THE JOURNAL appears the Index for Volume 136 of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION covering January, February, March and April. This index should have appeared in THE JOURNAL of April 24, but it was impossible to publish it at that time because of difficulties with the compositors who were not at work. The Index is paged to follow immediately the material that ended Volume 136, and may be bound with the volume so as to make it complete.

ARTHRITIS AND RHEUMATISM FOUNDATION

Elsewhere in this issue appears an announcement of the completion of negotiations which have been going on for some time toward consolidating into a single organization the leading agencies in the attack on rheumatic conditions, including the American Rheumatism Association, the National Arthritis Research Foundation, the Detroit Fund for Crippling Diseases and other groups that have been devoted to combating arthritis. As will be observed, the board of directors of the new Foundation thus far selected represent leaders in industry, philanthropy and medical science whose names carry confidence. The Foundation is organized along the lines of similar groups such as the National Foundation for Infantile Paralysis, the American Cancer Society and the American Heart Association, and it proposes to function in a similar manner. Its objectives include surveys of the problem, graduate education of the medical profession, education of the public, research, fellowships and improved care for those with rheumatic disease. Complete cooperation with the medical profession through county and state medical societies indicates recognition of the importance of medical cooperation in achieving the ends that are sought. The objectives indicated, the persons interested and the approach to the problem merit the support of the medical profession and the public.

THE WORLD MEDICAL ASSOCIATION

Since its organization in Paris in September 1947, the World Medical Association has made great strides. At present the national medical societies of twenty-six nations are members; applications from sixteen more nations are under consideration for admission to membership. The objectives of the World Medical Association have been stated previously in THE JOURNAL. The promotion of closer ties among the national medical organizations and the physicians of the world, the maintenance of the honor and dignity of the medical profession, mutual consideration of professional problems of the medical profession in the different countries and exchange of information on matters of interest to the medical profession, the establishment of proper relations with similar groups (such as the World Health Organization, the United Nations Educational, Scientific and Cultural Organization), improvement of health throughout the world, and the promotion of world peace are aims which merit the support of every physician. At this time through the office of the general secretary, Dr. Louis H. Bauer, surveys are in process concerning the status of the physician in different countries of the world, the standards of medical education, the qualifications and rating of specialists, the extent of recognition of cultist practice, and the advertising of medical products. Also in process of development is a bulletin to be issued periodically reporting the results of the studies that have been mentioned. In the United States a committee has been established to aid the work of the World Medical Association. Since the problems are such as will interest every physician who participates in civic and in medical affairs, opportunity is offered to individual physicians to become Founder Sustaining Members of the World Medical Association. The annual membership dues are $10. Many physicians are subscribing for five years in advance in order to place the World Medical Association promptly on an established basis. Individual members will receive the bulletin of the World Medical Association and certificates of membership in the United States Committee. Many medical organizations such as the American Medical Association and the International College of Surgeons have become associated through organizational memberships and are represented on the Board of Directors of the United States Committee. Many of the great medical industries have indicated their approval by substantial contributions. The House of Delegates of the American Medical Association has given its complete endorsement to this project. Physicians who wish to affiliate with the United States Committee of the World Medical Association may do so by addressing the World Medical Association at its permanent offices in New York City at 2 East 103rd Street. Thus they will share in a worthy cause and thus also they will have opportunity to keep abreast of the manner in which physicians throughout the world are joining to sustain the ethics and the ideals that have animated the medical profession for thousands of years.

RAILROAD TOILET WASTES

The Association of American Railroads requested its Joint Committee on Railway Sanitation to investigate the nature and quantity of toilet wastes discharged from railway passenger cars in both local and transcontinental service. The health problems developed by disposing of excreta on passenger-carrying cars along railroad rights of way and terminals have been studied for many years. The committee formulated a program of investigation and research which was approved by the United States Public Health Service. Studies were made first in several passenger cars of the New York to-Washington and Chicago-to-Washington runs and later in passenger cars in transcontinental services.[1] Observations were made during August, September, October and early November, 1946. Local service data were obtained from a total of thirty separate runs, during which time the toilet habits of 2,000 persons were studied over a total of 6,261 passenger hours and 320,000 passenger miles. Frequency of toilet use, maximum duration of toilet occupancy and frequency of toilet flushing were measured. Total toilet wastes were collected in sealed containers, carried underneath the cars, and the contents studied for dry weight of solids, strength of sewage as compared to ordinary domestic sewage and estimated quantity of sewage spread per mile of track. The last figure averaged 0.00235 pound (dry weight) of sewage solids per mile for a single run. Applying the data to the Pennsylvania Railroad's run between New York and Washington, which is believed to carry the heaviest passenger traffic in the United States, it was estimated that approximately 276,000 pounds (dry weight) of sewage solids were spread per year along 226 miles of road bed, or 0.694 pounds of dry weight per yard per year. For the country as a whole, assuming that passenger coaches travel one billion miles per year, the average estimate is 0.302 ounce on a wet basis per yard of track per year. Collected wastes were tabulated also for the presence of foreign objects. In addition to the usual material found in toilet wastes, foreign objects included men's handkerchiefs, miniature whisky bottles, beer bottles, cigaret packages, cigars and butts, orange peelings and in several cases, women's purses. Bacteriologic or culture studies are not included in this report. However, the communicable disease hazards in this situation are easily apparent. Such hazards would certainly occur during epidemic situations when healthy carriers of epidemic disease might be among passenger groups. The most obvious example of this, of course, would be the spread hazard from endemic or localized epidemic typhoid or dysentery outbreaks through deposit of carrier excreta in streams, water courses and swimming holes along railroad rights of way. In view of the known high virus content in the feces of poliomyelitis patients, convalescents and carriers, a similar epidemiologic hazard in this disease must be considered.

---

[1] Technical Report 3 (March 1, 1947) and Supplementary Report, 4 (December 1947): Report on an Investigation Into the Use of Railway Passenger Car Toilets and the Nature and Quantity of the Toilet Wastes, by Sanitation Research Project, Joint Committee on Railway Sanitation of the Association of American Railroads, Operations and Maintenance Department.

FOLIC (PTEROYLGLUTAMIC) ACID AND THE ANTI-PERNICIOUS ANEMIA FACTOR IN LIVER

The observations that folic (pteroylglutamic) acid will control the hematologic symptoms in most cases of pernicious anemia and certain other macrocytic anemias but will not control the neurologic symptoms, as does liver extract, have been reported by several investigators including Spies and his co-workers.[1] These results led the Alabama investigators to conclude that liver extract contains an unknown factor or factors other than folic acid essential for maintaining the integrity of the central and peripheral nervous system in pernicious anemia and, therefore, that folic acid does not replace liver extract in the treatment of pernicious anemia. The foregoing observations also serve to emphasize the incomplete understanding of the functions of folic acid in the organism and its relation to the active principle in liver. The excretion of phenolic substances in the urine is increased in patients with pernicious anemia, and adequate therapy with liver extract reduces the amount toward normal values.[2] This observation in patients may be related to the observation in folic acid-deficient experimental animals that the ability of the liver to oxidize the phenolic substance tyrosine is impaired.[3] Other experimental studies also indicate a general fundamental role of folic acid in the organism in addition to its effect on hemopoiesis, as is manifest by its probable stimulating effect on the production of certain metalloporphyrin cellular enzymes,[4] by its effect in preventing cervical paralysis in young turkeys,[5] by its alleged effect of inhibiting the growth of certain neoplasms[6] and, in patients with sprue, by its favorable effect on absorption from the gastrointestinal tract of such important nutrients as vitamins A and E and even dextrose.[7] The prediction seems warranted that further extension of studies such as those mentioned will lead to the eventual elucidation of the question regarding the relation between folic acid and the active anti-pernicious-anemia factor in liver extract.

PROTHROMBIN OR "PROTHROMBIN COMPLEX"

Investigators agree that in the process of blood coagulation thromboplastin acting on prothrombin in the presence of calcium forms thrombin, which in turn causes fibrinogen to change to fibrin. Following the separation of these chemical principles into concentrates it was recognized that the reaction between purified substances took place much more slowly than does the reaction in blood plasma.[1] This difference in reaction rate is attributable to the presence of additional substances in blood plasma. In their work with these additional factors one group of workers [2] in this country has chosen to refer to them as part of a "prothrombin complex," with the apparent assumption that for a maximum rate of coagulation these different components must be present in certain limiting concentrations. Other workers prefer to consider these additional factors as accelerators of the original reaction by which a single substance, prothrombin, is changed to thrombin. The accepted interpretation, it would seem, should depend on the extent to which these substances unite to become part of the thrombin molecule: if they all unite in significant amounts to form thrombin, they should be considered as a complex; but if the thrombin consists essentially of a slightly modified form of one of them, this should be considered to be the single prothrombin. The correct interpretation thus becomes dependent on the chemical isolation of the principles concerned and the study of their composition and mode of interaction. Such studies have already been carried out: the isolation of prothrombin from plasma in high yield, apparently as a single component, and its activation to thrombin[3] would appear to show that this is the precursor of thrombin and that other substances may be looked on as accelerators. Accelerators of the prothrombin reaction have been reported by various investigators, but because of differences in procedures employed it is difficult to determine the extent to which these investigators may be dealing with the same substance. The precise delineation of the factors involved in blood clotting and their reactions with each other requires continued work in chemical fractionation, isolation and analysis.

HEBERDEN'S NODES
